THE ENGINEERING AND MINING JOURNAL.

VOLUME XXXV., JANUARY TO JUNE, 1883.

INDEX.

(Articles marked with a star are illustrated. The reader may further consult the titles under the sub-headings.)

A

Academy of Sciences, the National, Papers Read at..... 217
Accident Statistics..... 176
Accidents in Anthracite Collieries..... 102
Accidents, Fatal, in 1882..... 20
Accidents, Mining, in the United States, in 1882..... 32
Accumulator, the Elwell-Parker..... 382
Accumulator, the Faure..... 20
Acid-Making, American Pyrites for Making..... 266
Acid Mine Water..... 265
Acid Product from Wire-Works to be Utilized in the Manufacture of Copperas..... 150
Adams County, Pa., the Geology and Copper Deposits of..... 112
Agricultural Land, Lode Claims on..... 17
Air, Compressed, Locomotives, in an English Colliery..... 90
Air-Compressor. *See* Compressor.
Alabama Coal Lands..... 173
Alabama Mineral Lands..... 210
ALABAMA MINING NEWS..... 368
ALASKA MINING NEWS..... 33
Albion Mining Co., Nev., Report, 48; Attachments against, 123; Sale of Personal Property of..... 321
Alexandrowsky Steel-Works, St. Petersburg, Russia..... 16
Alkali Lands..... 85
Allouez Mining Co., Mich., Report..... 189
Amador Mill, Mining, and Tunnel Co., Cal., Suit against..... 353
Amalgamating-Plates for Saving Gold, the Largest ever Made..... 336
Amalgamation. *See* Electro-Amalgamation.
Amalgamation, "Continuous" Pan, the Question of Time in..... 112
Amalgamation, Pan, the Boss "Continuous" System of..... 86, 97
Amber in New Jersey..... 120
American Ferro-Manganese and Iron Co., Ga., Report..... 296
American Institute of Mining Engineers, Boston Meeting: Announcement, 1; Programme, 69; 97; Proceedings, 98, 111, 113; Officers, 113; *Transactions*, 111. Roanoke Meeting: Announcement, 203; Programme, 266; Proceedings, 327, 328, 344
Ammonia Industry, the, and the Scotch Iron Manufacture..... 162
Ammonia, the Removal of, from Crude Gas..... 236
Ammonio-Phosphatic Deposit in the Vicinity of Cape Town..... 352
Analyzing Ores and Chemical Products, 286
ANTIMONY. *Under* METALS — FINANCIAL..... Weekly
Anvil-Blocks Large, for Steel-Works... 281
Apatite Deposits, Canada..... 103, 211
Apatite, Quebec, Can., Analysis of..... 121
Arbitration Tribunal, the, at Pittsburg 359
Arents, Mr., and the Stetefeldt Furnace 348
Argenta Mining Co., Nev., Report..... 34
ARIZONA MINING NEWS, 7, 20, 33, 46, 61, 75, 91, 105, 121, 136, 150, 166, 180, 196, 210, 226, 258, 272, 287, 304, 320, 336, 353, 368, 383
Arroyo Grande Tin Mines, Mexico..... 42
Arsenic, the Estimation of..... 256
Arsenic in Pyrites..... 280
Ashcroft Furnace-Door and Grate-Bars, Competitive Tests..... 286
Assay, Silver, the Volhard..... 2
Assay-Office Statistics, 37, 67, 127, 230, 275
Assays, Dry and Wet, at the English Mint..... 381
Assayers, Young, Suggestions to..... 30
Assaying in our Mining Schools..... 98
Atlantic Mining Co., Mich., Report..... 175

B

Bailey, J. Trowbridge..... 83, 187
Baker Horse-Power Hoist, the..... 316
Bank Statements, Foreign. *See* BULLION, *under* FINANCIAL..... Weekly
Baltimore & Ohio Railroad, Extending a Line from..... 250
Barbed Wire Fence Patents, Important Decision..... 336
Barcelona Mining Co., Nev., to be Listed at the Mining Board..... 339
Barff-Bower Process Applied to Ships. 336
Barnum, E. T., Wire and Iron-Works, Detroit, Mich..... 20
Basic. *See* Open-Hearth.
Basic Brick..... 218
Basic Furnace Linings..... 224
Basic Process in England..... 90
Basic Process, the, in the Open-Hearth Converter..... 249
Basic Process, the, Progress of, in Europe..... 327
Basic Process, the, at Steelton..... 302
Basic Bessemer Process, the, Adopted in the United States..... 265
Bath of Base Bullion, the Use of Steam for Stirring Zinc into..... 375
Batopilas Silver Mining Co., New Mexico, Report..... 49
Batteries, Secondary, Forming..... 162
Batteries, Storage..... 241
Beckwith Carbon Co., Pittsburg, Pa., Carbon Points..... 368
Belcher Mining Co., Nev., Financial Statement..... 92
Berryman Tunnel and Mining Co., Nev. 212
Bessemer Converter, the Chemistry of the..... 193
Bessemer Ores, Hudson River..... 69
Bessemer Process, Some Swedish Experiments with the..... 104
Bessemer Steel in its Cast and Unwrought Shape..... 296
Bessemerizing Copper Matte..250, 280, 376
Bessemerizing Matte in a Reverberatory Furnace..... 144, 192, 219
Bethlehem Iron Company Purchasing Mines in Cuba..... 157
Béton. *See* Concrete.
Béton in Conjunction with Iron as a Building Material..... 351
Big Pittsburg Mining Co., Colo., Reorganized..... 107
Black Hills, Freight Rates to the..... 252
Black Tom Reef, New York Harbor, Submarine Drilling Operations in..... 31
Blake, Prof. William P., 265; his Description of the Silver King Mine..... 249
Blast, a Great, at the Glendon Iron Company's Quarries..... 27, 39
Note.—For 29,000 *tons* of Judson Powder, *read* 29,000 *pounds*.
Blast-Furnace Coke, the Qualifications of..... 101
Blast-Furnace, a Comparison of the Working of a, with Blast Varying in Temperature from 990 Degrees Fahr. to 1414 Degrees Fahr..... 316, 329
Blast-Furnace, the Lynchburg..... 329
Blast-Furnace, the New, of the Crozer Steel and Iron Company..... 345
Blast-Furnace, English..... 91
Blast-Furnace, in a Spanish Iron Mine.. 150
Blast, a Large, in a Spanish Iron Mine.. 150
Blende and Pyrites, the Büttenbach System of Separating..... 162
Blende, Quicksilver in..... 160
Boilers, Silver. *See* Corrosion.
Bolivia, the Silver Production of..... 336
Bonanzas, Oxidation and Impoverishment of Surface Ore and Concentration of Gold in..... 332
Boracic Lagoons in Italy..... 120
*Boss "Continuous" System of Pan Amalgamation, the..... 86, 97
Bosses and Over-Men. *See* Examinations.
BOSTON MINING STOCKS—FINANCIAL. Weekly
Bower-Barff Process..... 99
Bradshaw Mining Co., Ariz., Report... 320
Bridge, the Brooklyn..... 296
Briesen, F Von, Absurd Statements of. 39
Briggs, Calvin..... 349
Brimstone and Pyrites for the Manufacture of Sulphuric Acid, Comparative Merits of..... 251
Brimstone from the West Coast of Africa..... 173
Bronze Chisel, an Ancient Peruvian... 179
*Buchanan Magnetic Separator, the... 133
*Bu dle, the Linkenbach..... 223
Bull Direct Process of Iron Manufacture. 6; Purchase of..... 164
Bulletin des Mines, the, and its "Translations" from Our Columns..... 279
Bullion, Base, Bath of, the Use of Steam for Stirring Zinc into..... 375

DR. THOMAS M. DROWN, Secretary of the American Institute of Mining Engineers, announces that the annual meeting of the Institute will be held in Boston, beginning Tuesday, February 20th, 1883.

THE Finance Committee of the Senate has now completed its little tariff bill, which places an expectant country in the embarrassing position of having three sets of schedules to choose from. There are very few articles, so far as we have been able to see, in examining the metal schedule, in which the members of the Tariff Commission, of the House Ways and Means Committee, and the Finance Committee of the Senate agree. The Tariff Commission on the whole recommended a modest reduction; the Ways and Means Committee tinkered with the schedule so devised, to the extent of increasing a few figures, often in a very injudicious manner; the Senate Committee, on the other hand, has, in a general way, proposed a further reduction. They compare as follows:

	Present.	Ways and Means.	Senate Finance C.
Iron ore	20 per cent.	50c. per ton.	50c. per ton.
Iron pyrites	20 per cent.	50c. + 2½c. for copper.	50c. + 2½c. for copper.
Oxide manganese	20 per cent.	50c. per ton.	.....
Pig-iron	$7 per ton.	0·3c. per lb.	$6 per ton.
Cast scrap	$6 per ton.	0·3c. per lb.	$6 per ton.
Wrought scrap or scrap steel	$8 per ton.	0·3c. per lb.	$6 per ton.
Bar iron, according to dimensions	1@1·5c. per lb.	0·9@1·2c. per lb.	0·9@1·2c. per lb.
Iron railroad bars	0·7c. per lb.	0·7c. per lb.	0·7c. per lb.
Cut nails and spikes	1·5c. per lb.	1·25c. per lb.	1·25c. per lb.
Iron and steel forgings	2c. per lb.	2½c. per lb.	.....
Anvils and cable chains	2½c. per lb.	2c. per lb.	2c. per lb.
Boiler tubes	3½c. per lb.	3c. per lb.	4c. per lb.
Other wrought-iron or steel tubes	3½c. per lb.	2¼c. per lb.	2¼c. per lb.
Boiler and sheet-iron, according to gauge	1¼@1½c. per lb.	1·3@1·9c. per lb	1·25@1·8c. per lb.
Tin plates	1·1c. per lb.	2c. per lb.	1·1c. per lb.
Hoop, band and scroll	1¼@1¾c. per lb.	1·2@1·6c. per lb.	1·2@1·6c. per lb.
Steel ingots, blooms	45 per cent, and on smaller sizes valued at 7c., or less, 2¼c.; above 7, 3c.; above 11, 3¼c. per lb.	Valued at 2½c., or less, 2c. per lb.; above 2½c., 2¾c. per lb.; above 9, 3c. per lb.	Valued at 5c., or less, 1½c. per lb.; above 5c., 2c. per lb.; above 9c., 2¾c. per lb. (all crucible). All steel ingots, blooms, etc., not crucible steel, 0.6c. per lb.
Steel railroad bars	1¼c. per lb.	0.8c. per lb.	0.8c. per lb.
Iron wire	¼ in. diam. to No. 16, 2c. + 15 per cent.; No. 16 to No. 25, 3·5c. + 15 per cent; above No. 25, 4c. + 15 per cent per lb.	To No. 10, 2¼c.; No. 10 to No. 18, 2¾c.; No. 18 to No. 26, 3¼c.; above, 4c. per lb.	No. 5 to 10, 1½c.; No. 10 to 16, 2c.; No. 16 to 26, 2½c.; smaller than No. 26, 3c.
Steel wire	¼ in. diam. to No. 16, 2½c. + 20 per cent; finer, 3c. + 20 per cent.	Same as iron wire.	Same as iron wire.
Wire cloth	Not provided for.	Same as wire of same gauge + 3c. per lb.	Same as wire of same gauge + 2c. per lb.
Wire rope	Not provided for.	Same.	Same as wire of same gauge + ¼c. per lb.
Lead ore and dross	1½c. per lb.	1½c. per lb.	1½c. per lb.
Pig-lead	2c. per lb.	2c. per lb.	2c. per lb.
Manufactured lead	2¾c. per lb.	2c. per lb.	45 per cent.
Nickel	37c. per lb.	15c. per lb.	20c. per lb.
Copper ore	3c. per lb.	2½c. per lb.	2½c. per lb.
Regulus	3c. per lb.	3½c. per lb.	3½c. per lb.
Ingot	5c. per lb.	4c. per lb.	4c. per lb.
Manufactured copper	45 per cent.	35 per cent.	35 per cent.
Yellow metal	.....	3c. per lb.	.....
Antimony	.....	10 per cent.	.....
Spelter	1½c. per lb.	1½c. per lb.	1½c. per lb.
Sheet-zinc	2¼c. per lb.	2¼c. per lb.	2¼c. per lb.

The most striking changes in iron are the reduction in pig—already announced—a slight reduction in plate and sheet, a retention of the present duty on tin plates, and quite a sweeping lowering on steel. The Finance Committee singles out crucible steel, with the rates specified, and then places all other steel in crude form at 0·6 cents, with steel rails unchanged at $17.92 per ton. It attempts, too, a solution of the vexed question, "What is steel?" which in years past troubled the experts in the American Institute of Mining Engineers so much. The definition is as follows:

"Steel in any form not specially enumerated or provided for in this act, per pound, three cents. Provided that all metal produced from iron or its ores, which is cast and malleable, of whatever description or form, without regard to the percentage of carbon contained therein, whether produced by cementation, or converted, cast, or made from iron, or its ores, by the crucible, Bessemer, pneumatic, Thomas-Gilchrist, basic, Siemens-Martin, or open-hearth process, or by the equivalent of either, or by the combination of two or more of the processes, or their equivalent, or by any fusion or other process which produces from iron or its ores a metal either granular or fibrous in structure, which is cast and malleable, excepting what is known as malleable iron castings, shall be classed and denominated as steel."

The committee sweeps away the increase on larger sizes of iron and steel wire recommended by the Ways and Means Committee, and makes a strong reduction all around. It discriminates especially against wire rope.

The metal schedule proper remains in much the same position as before.

Among the recent recommendations of the House Ways and Means Committee, we notice 30 cents per ton on coal slack, 75 cents on bituminous coal, 20 per cent on coke, 30 per cent on gunpowder and explosives generally, india-rubber goods 25 per cent, and salt in bulk 6 cents per 100 pounds. The Finance Committee, however, goes back to the old figures.

THE GENESIS OF ORE-DEPOSITS.

We publish elsewhere an article on this subject by Mr. RUDOLF KECK of Denver, which deserves attention, as a suggestive attempt to generalize from known data, and also a contribution to the data themselves. Under the latter head, we should feel obliged to Mr. KECK if he would give us more in detail the experiments of Professor SANDBERGER, to which he alludes. We have not yet read the book, and know it only through the medium of the Austrian *Zeitschrift*, in which, by the way, Professor SANDBERGER'S conclusions are vigorously attacked.

We publish Mr. KECK'S paper because we like it, not because we agree with it. We are glad to have the subject of ore-deposits discussed from the stand-point of chemical geology, and we welcome intelligent contributions to such discussion, whether they represent our views or not. Moreover, the importance of closer study and description of individual mines and mining districts is very great; and we are glad to have it emphasized. As Professor POSEPNY has forcibly urged, a good deal of this sort of work must be done, before safe generalizations will be possible. The English mathematician, DE MORGAN, cited the vast amount and meager results of meteorological observations as an instance of the failure of the inductive method. But the rapid progress in meteorological science which has followed the activity of our Signal Service Bureau proves that the former difficulty was not in the inductive method, but in the loose and heterogeneous character of the observations. The data heretofore accumulated as to ore-deposits are open to similar criticism. Thousands of descriptions of mines and mining districts have added lit-

Digitized by Google

tle to our theoretical knowledge. As Mr. KECK says, the work should be more carefully done, and the chemist and microscopist should be called to assist.

Discussion is doubtless what Mr. KECK, like all other thoughtful inquirers, most desires; and we shall pay him the compliment of indicating some points in which we consider his views defective. Their one comprehensive defect is that which affects all generalizations at the present stage of our knowledge. They are premature. Mr. KECK is quite right in attributing much to the agency of water, organic matter, etc. But we think the details of his theory, as a general theory, are not sufficiently supported by facts.

Briefly stated, the theory is, that the sulphide ores were present in the original eruptive rocks as silicates of the metals, and that they were changed into sulphides by the action of alkaline sulphides, which themselves derived their sulphur from organic matter of animal origin. The first difficulty in this hypothesis arises from the probability that all known eruptive rocks are themselves the product of the fusion of sedimentary rocks. It is therefore not safe to consider as the "primitive constituents" of an eruptive rock substances which may have entered it after fusion and before (or even after) solidification.

Again, if we are to go back to primitive rock-constituents, we can not ascribe to organic origin the vast quantities of sulphur required for the production of metallic sulphides. The organic sulphur must itself have been obtained from the inorganic world. In short, there must have been sulphur before there were sulphates and sulphides, in the mass of the earth itself. The hypothesis that the ocean itself at one period was sulphatic has much in its favor, as Professor WURTZ and others have forcibly shown, though they have not shown the compatibility of such an ocean with animal or vegetable life, and must therefore, we suppose, relegate it to a period anterior to the appearance of such life. The whole subject is still obscure; but in the present state of our knowledge, it is more reasonable to assume the formation of sulphates without the intervention of organic matter, than to suppose the metals to have been, in original combination, silicates. Moreover, the specific gravity of the earth's interior is higher than that of such silicates as we find in its crust.

The agency of organic processes in the formation of ore-deposits has been lucidly explained by Prof. STERRY HUNT, with whose chemical and geological essays Mr. KECK does not seem to be familiar. It is eminently a work of redistribution and aggregation. But we do not think it can be made the agent of sulphatization.

Nor do we agree with Mr. KECK in attempting to classify the ages of vein-formation according to their mineralogical contents. The data are not sufficient as a basis for any such law. To take his own example, we do not always or nearly always find that veins of banded structure show first quartz, then metallic sulphides, and then spars, filling the fissure. It would be easy to cite innumberable instances in which bands of spar inclose a later filling of quartz, and in which the metallic ores are contemporaneous, to all appearance, with the quartz. In fact, this is one of the very points which should not be confused by generalization, but carefully studied, free from all such predisposition, in each individual instance.

We differ again with Mr. KECK as to the invariable character of the process of ore-deposition. Perhaps we do not quite understand what he means when he says that the circumstances were manifold, but the process in itself was always the same. Perhaps he is thinking more particularly of certain kinds of ore-deposits. At all events, the statement, if it means any thing, is scarcely applicable to such various deposits as are actually known to the miner.

Some light is perhaps thrown on it by Mr. KECK'S proposed classification of ore-deposits. He objects to distinguishing them according to their form or their contents, and proposes instead a classification based on a single feature in their history. Three classes, he says, cover all that he can conceive—fissure-veins, veins of replacement, and secondary deposits. This shows how much easier it is to criticise than to construct. The systems which Mr. KECK condemns are at least good for something. It is convenient, if not scientific, to talk about gold, silver, copper, or lead deposits; it is convenient to speak of veins, beds, and masses; and we undertake to say that Mr. KECK never does and never could describe an ore-deposit without including these features. But the system he proposes as a substitute is scarcely good for any thing. Nearly all veins of replacement are enlargements of original fissure-veins; the majority of fissure-veins have been enlarged by processes of replacement; and the term secondary deposits, though a handy one for loose, popular description, can scarcely receive a scientific definition which would not include fissure-veins and veins of replacement. Yet, indefinite as these classes are, it would be difficult to bring under either of them such deposits as the Ducktown copper mines, the iron mines of New Jersey, Lake Champlain, or Lake Superior, the Mansfield copper-schists, and many others. Mr. KECK'S own illustrations condemn his system. He puts the Leadville mines under "veins of replacement," but the lead ore-deposits of the Upper Mississippi and of Raibl in the Austrian Alps under "secondary deposits," to which class also he refers the quicksilver mines of California!

We heartily agree with him in condemning "the absurd worship of fissure-veins." But it is useless to deny that fissure-veins afford, in their greater regularity of form, a certain guaranty of permanence which is wanting in some other kinds of deposits.

Mr. KECK apparently subscribes to the belief that the contents of fissures are derived from the country-rock inclosing them. This is true enough, in a sense; but it need not be true that the metalliferous contents of a fissure came from the wall-rock at precisely the horizon where they are now found. The general term "from below" includes also the deeper-lying country-rock through which a fissure may pass. We are not ready yet to admit that the lead, silver, and iron ores of Leadville came from the limestone which underlies them or the porphyry that overlies them. And the proof offered of minute traces of these metals found by analyses in the rock is not sufficient to cover the case. *

CORRESPONDENCE.

[Communications will be noticed only when accompanied with the full name and address of the writer. Unless specially desired, only initials will be printed. We invite criticism and comment by the readers of the ENGINEERING AND MINING JOURNAL. Replies not intended for publication should be addressed to the Editor of the ENGINEERING AND MINING JOURNAL in blank, stamped, and sealed envelopes.]

The Volhard Silver Assay.

EDITOR ENGINEERING AND MINING JOURNAL:

SIR: The Volhard silver assay process having been recommended to me by a gentleman of acknowledged ability in metallurgical matters, as an exceedingly accurate method, and one now coming into use among assayers in Europe, I have had a series of tests made by one of my most careful assistants in the "silver room," under my personal observation, with the results set forth in the following report, which I send you as being of general interest.

If any of your readers have used the process with satisfactory results, and can furnish any suggestions regarding manipulation, etc., which would increase its efficiency, such suggestions will be cordially received.

Yours truly, HERBERT G. TORREY,
U. S. Assayer.

UNITED STATES ASSAY OFFICE,
NEW YORK, Jan. 3, 1883.

MR. HERBERT G. TORREY, U. S. ASSAYER:

DEAR SIR: In accordance with your request, careful tests have been made of the "rhodan-ammonia" process for assay of silver bullion, and I submit herewith a brief report of the results of the experiments, with remarks as to its applicability to the operations of this office.

The process depends upon the strong affinity between thiocyanic acid and silver, and the intense color formed by its combination with iron. Sulphocyanate of ammonia is added to the silver solution in presence of a ferric salt, and when all the silver present is satisfied, the thiocyanic acid combines with the iron, producing a color which varies from light brown to deep red, according to the quantity of sulphocyanate added.

In the first tests, the solution of rhodan-ammonia was made of such a strength that 100 c.c. precipitated a little less than 1000 milligrams of silver. From a solution of one tenth strength, small amounts were added until a permanent color appeared. In this way, several sets of ten or twelve assays each were worked, and the results compared with those obtained by our usual salt method.

To secure more rapid and satisfactory returns, the solution was changed so that 100 c.c. completely precipitated 1000 milligrams of silver, and left a slight excess of the precipitant, producing a red color of intensity varying in proportion to the excess of the sulphocyanate, and the assay was then worked to the point of neutralization by the addition of a decimal solution of silver, until the color disappeared. On comparing with chloride assays, this was found to give somewhat better returns than the first method, in some instances agreeing closely with the correct fineness, but in others differing too largely to be at all satisfactory.

Comparison with the chloride method was then abandoned, and sets of proof silver were weighed with scrupulous exactness, and special attention paid to the boiling of the assays, to expel all the lower oxides of nitrogen formed during the solution of the silver. To determine both the delicacy and accuracy of the process, these were worked after the first charge, with a solution diluted so that 10 c.c. contained one milligram of silver, and a correspondingly dilute solution of rhodan-ammonia. This was continued until the repeated discrepancies between the results showed that the process, as applied in these experiments, was not reliable closer than one half thousandth.

Assays of proof silver made by the salt method will indicate differences of one quarter thousandth with great distinctness and reliability, and in our regular work we frequently note differences of less than one quarter thousandth, which we call tenths, so that even on fine metal, the process failed to show any superiority over the salt.

When ten per cent or more of copper is present in the bullion, the color of the solution interferes with the noting of the appearance or disappearance of the iron reaction, while in the salt method copper is not an impediment.

Other points observed during the experiments may be briefly mentioned as follows:

It requires less agitation than the chloride process; but I think that it would nevertheless take fully as much time to work a set, as with salt, and there is the additional operation of adding the ferric indicator.

It requires prolonged boiling, the experiments tending to show that the presence of the fumes of nitric peroxide render the assay worthless, although the investigation was not followed up in this direction.

In conclusion, I would respectfully submit that the experiments here reported upon conclusively show that the rhodan-ammonia process, so far as known and applied by us, is decidedly inferior to our present chloride method. Yours respectfully, GEORGE R. COMINGS.

THE GENESIS OF ORE-DEPOSITS.

Written for the Engineering and Mining Journal by Rudolf Keck, Denver, Colo.

The aim of the study of ore-deposits is to acquire a clear understanding of their genesis, which will enable the miner to conduct both prospecting and mining in a rational manner. But in no branch of geology are we so far from a clear understanding as in this. The reason is that, as a positive science, it requires the working together of the chemist, the mineralogist with his microscope, and the mining engineer. But the latter professes to have no time for reading geological periodicals, or for giving careful descriptions of the particular phenomena of his mine or mining district, with correct maps, or an abstract of the more important practical conclusions at which he has arrived; while we can not always expect that the chemist and mineralogist have acquired practical experience in regard to the different conditions of ore-deposits as they appear before our eyes. Hence, we should not wonder that we find the literature in this branch so limited in amount, and still more in scope.

In the three books written on ore-deposits, and published during the last thirty years, by Cotta, Grimm, and Groddeck, we fail to find what we are looking for—characteristic distinctions among the ore-deposits, instead of differences determined by their mere shape, or by the kind of metals they bear. The ghost of the formerly almighty plutonic school is still hovering between the lines of these books; fissures are opened, closed, and reopened like the stops on a clarionet; dikes of the same rock content themselves by catching cold; at another locality, but under the same circumstances, they do not, just as may be required for a plausible explanation; parts of the vein-matter emigrate into the wall-rock, and suggestions of ore sublimation or igneous injection are gravely made. If we find such crude doctrines in these books, otherwise very good, what can we expect from periodicals, and the ordinary little text-books on geology? Look at their pictures, representing veins like mathematically correct parallelopipeds! Nothing is said about the fact that they are mostly small and irregular in length and composition, while the wood-cut hints that they go down to the center of the earth. The innocent student can not help but see our earth's crust full of bonanzas, and impatiently waits for the time when he can go prospecting.

Thirty years ago, chemists (especially G. Bischof, of Bonn) made revelations previously unanticipated in geology; and more recently, the microscope has led to a complete revolution in petrography. Thirty years ago, Bischof had proved that the materials of the gangue in veins originated in their wall-rocks. But a few years ago, Prof. F. Sandberger, at the University at Würzburg, Bavaria, himself a practical mining engineer, arrived at the conclusion, and followed it out, that substances which occur together in such close connection as vein-material and ores must logically have a similar origin. He separated the constituent silicates of rock (for instance, mica), and analyzed them in much larger quantities than those generally used for analysis. The results were and still are quite astonishing. With the exception of tellurium, gold, and mercury, for which he could not get proper material for analysis, all the chemical elements occurring in ore-veins have been detected *in those silicates*, undoubtedly demonstrating that not only the ingredients of the gangue, but also those of the ores, are contained in the eruptive rocks which often are the wall-rocks of veins, or occur in their vicinity. A further result of his laborious researches is the proof that these metallic contents are found in the silicates of crystalline rocks of *all* geological periods.

We find ourselves forced to believe in a causal connection between eruptive rocks and ore-deposits, when, in the light of Professor Sandberger's researches, we study the aspect of volcanic rocks and the transmutations they undergo subsequently to their first consolidation, by weathering, by exhalations of sulphureted hydrogen, muriatic acid, and other gaseous emanations, by which they are converted from a hard to a soft clayey state, or are bleached and become porous, fissile, or honeycombed, until at length they crumble into a siliceous powder; when we observe the massive segregations of ores in eruptive rocks; when we take into consideration that those mountainous regions in which eruptive rocks are wanting contain the least ore-deposits, and that the ore-deposits occur more frequently in older than in the recent rocks, and are more common at the junction of various kinds of rocks than in the midst of large districts of a uniform rock; and that they usually occur in the latter case, only in case the rock is metamorphosed.

The entire material of all sedimentary rocks has been derived from the destruction and decomposition of former ores; thus it can be traced back to that region in our earth's crust from which the eruptive rocks were and are still arising.

The Archæan rocks are, among those of all sedimentary periods, the richest in ores, not only because they show the mightiest development, but also because they have been longest exposed to volcanic and chemical activity. "They are the *only universal* formation, they extend over the whole globe, and were the floor of the ocean and the material of all emerged land, when life first began to exist." In these rocks we have to acknowledge the visible origin of certain ores which we find, nowadays, *as secondary products in higher geological horizons.*

The fact that all minerals occurring in ore-deposits could have originated in aqueous solutions; the drusy or combed texture of some ore-deposits; the occurrence of minerals together with fragments of the wall-rocks in veins, a part of which appears to have been disintegrated by the action of water and friction; the omnipresence of water above and in our earth, especially during former geological periods; the absence of all indications of former *intense* heat within the ore-deposits; the pseudomorphoses and other mineralogical phenomena; all these circumstances indicate that water was and still is the main agent in the mineralizing process.

All subterranean movements that produce joints and fractures in rocks, and the chemical action of the water circulating in our earth's crust, have given origin and peculiarities to ore-deposits. In many cases, it is evident that the origin of an ore-deposit commenced with a more or less empty fissure caused by subterranean movements; but in many other cases, this can not be shown. The occurrence in granite of numerous crystals of tourmaline more than six inches long, but fractured and cemented together again in their finest fractures by granitic matrix; the occurrence of fractured crystals of orthoclase in granite; limestone containing manifold minerals at its contact with granite; all this demonstrates that an afflux of silicates in solution has taken place after the crystallization of other silicates within the granitic mass. Remember also that the microscope has proved that within eruptive rocks transmutations and new compositions of minerals have taken place, by means of which the primitive state of those rocks is essentially changed. We see such changes taking place. We see mountains of formerly eruptive rocks altered to serpentine, chloritic and talcose shists, diabase and other rocks, as secondary products by mere chemical action. We find dolomites decreasing in their quantity of lime, by which procedure they decrease in their volume. We observe that anhydrite, by the mere admission of one fourth of its weight of water, has been transformed to gypsum, while the increase of its volume has been so great and powerful that mighty sediments have been upheaved, distorted, bent, or folded. Should we not, then, be induced by such facts to believe that the origin of veins has not been in every case in the opening of fissures by rough volcanic power or other subterranean movements, but that the veins have attained their present dimensions by the gradual solution, removal, and replacement of the rocks? In many cases, we may even suppose that the faults in a rock or the fractures within veins were caused by the preceding chemical and physical internal changes.

Change of the Silicates of Metals Contained in the Eruptive Rocks into Sulphides.—The meteoric water on the surface of our earth carries free oxygen, nitrogen, and carbonic acid. Penetrating the upper parts of the earth, which are rich in decaying organic matter, the free oxygen produces carbonic acid, which is absorbed by the water; but this on its way downward takes up still more carbonic acid, which rises from the interior, and carries down also some organic substances which reduce the sulphates of metals to sulphides. In this way, the water effects the decomposition of a great many minerals by solution and precipitation. The results are carbonates, sulphates, sulphides, and silicic acid (becoming quartz afterward), while the less soluble part mostly remains as silicates of alumina (clay) and magnesia (talc).

The microscope has revealed the existence in abundance of minute cavities in eruptive rocks, in which water and salt, compressed carbonic acid, and sulphates are inclosed so hermetically that the water does not escape even when strongly heated. These substances are *primitive constituents* of such rocks as well as the silicates. Therefore, it is probable that there were more of these substances present during the eruptions of the rock, especially also sulphureted hydrogen, as we observe them during volcanic eruptions nowadays. The same gas is produced by means of organic matter reducing the sulphates of alkalies to sulphides, which change the salts of metals to sulphides. And in what state do we find the metals of our own ores generally? In that of sulphides.

Organic matter still occurs in many veins; for instance, in the state of asphaltum in the cinnabar mines in the Bavarian Palatinate; in that of petroleum in mines in California, Nevada, and Hungary; in that of anthracite and graphite in mines in Transylvania, Portugal, Derbyshire, Calcutta, Saxony, Baden, etc.; and plentifully in the petrified organic bodies of sedimentary rocks, and as coloring ingredient of fluorspar, amethyst, and smoky quartz in many mines.

It is an evident fact that in many mines the quantity and richness of the ores depend on the occurrence of organic matter, which is only the remains of larger quantities of it, present in a state of decay in former times. To this day, sulphureted hydrogen is very common among the gas exhalations found on and in our earth, and is easily absorbed by the circulating waters therein. But if that organic matter did not contain more or less sulphur, it could not therefore produce much sulphureted hydrogen; and hence, in regard to *ore-building*, those sediments were more favorable which contained the remains of *animal* bodies; for instance, the upper bed of the blue limestone at Leadville; while we find no unusual concentration of metallic matter in the great beds of bituminous shale in the Paleozoic rocks, the carbonaceous matter of which has been derived from the remains of sea-weeds.

The more the leaching process we have described advanced, the more were the bicarbonates changed into monocarbonates, and the more were the dissolved salts of lime, baryta, etc., enabled to crystallize out of their solution. Thus, we find as ultimate result of that process those different minerals constituting the "gangue;" for instance, the various carbon spars, the heavy-spar, and fluorspar. And thus we find just those veins to be the latest in origin, in which these spars predominate; they cross the other veins in which quartz and ores predominate. Therefore, we may suppose that many dissimilar so-called vein-formations are in the main but formations of different leaching periods. In veins with banded or combed structure, we almost always observe that quartz has opened the period of deposition; the veins of the "noble quartz formation" are indeed the oldest *among the vein-formations.* Then followed a period of segregated metallic sulphides, and the different spars terminated the more or less close filling of the fissure. Then began the period of secondary mineral products, which is still going on before our eyes. Meanwhile, rocks which had covered the top of such vein-regions were carried off by erosion, in consequence of which the meteoric waters containing air got access to the vein and began their oxidizing and chloridizing work on the minerals. Thus we often find in the upper parts of veins a zone of oxidized metals and their compounds with acids, constituting the "gossans," the "iron hat," the "pacos," etc. In many cases, this zone is a zone of enrichment; for instance, in the ore-deposits of Chili, of Leadville, of the gold-bearing veins of Colorado, etc.

Many of these upper zones and their wall-rocks may have reached farther up in former times; but they were also carried off by erosion, the products of which we find in veins, although they are rare. For instance, in Pennsylvania there is a vein between walls of propylite, which itself contains breccia of quartz porphyry, mica slate, and various kinds of sandstone. In Bolivia, there occurs a vein in porphyry, which contains breccia of argillaceous slate. In a vein at Schemnitz, Hungary, quartz pebbles occur extending to the depth of 930 feet. Fossils and other foreign bodies have also been found in mineral veins. But the most interesting occurrence of this kind is that of literally conglomerate veins in Colorado and Utah. There, the spaces between the round pebbles and boulders were filled with a mineral solution cementing the pebbles and boulders together into a conglomerate ore. In the Bassick mine, near Silver Cliff, Colorado, the pebbles consist of various kinds of eruptive rock, mingled with which are masses of silicified wood and charcoal; the

Digitized by Google

ore consists of rich tellurides of gold and silver, free gold, and the argentiferous sulphides of lead, zinc, copper, and iron. In the Bull-Domingo, near Silver Cliff, Colorado, and in the Carbonate mine at Frisco, Utah, the cementing matter is argentiferous galena.

How were the precipitated metallic sulphides segregated and consolidated in depth? The books say only that the fissures have been filled by mineral springs; but they do not tell how. There are many mineral springs carrying free carbonic acid, sulphates, sulphureted hydrogen, or organic matter, arising from the selvages of ore-veins, using the latter like other fissures as their shortest way to the surface of our earth. Hence, the conclusion was drawn that a causal connection may exist between these springs and the minerals in the vein. But Professor Sandberger had, several times, opportunities to pump out such springs, and to examine the fissures through which the springs were ascending: he never found a single trace of a sediment on the walls, although they cause large sediments of minerals on the surface, where the air has access.

Those who are acquainted with the rules of ore concentration know how slowly a current of water will carry off fine grains of minerals, no matter how high their specific gravity may be. The segregation of the fine particles in such precipitates would take place only in *stagnating* water containing a larger amount of organic matter than those springs contain. Those springs have never caused the formation of a mineral vein; they have only carried off from them. But they cause precipitation and fixation of the precipitated sulphides by *filtering* through a material offering *a great surface*. An instructive example of this was given by a mineral spring in the vicinity of Fulda, Germany; its upper part had caved in, and the water was then flowing between the pebbles of the alluvium, coating them with pyrites as nicely as the galvanic process does.

The miner has not very often to do with regular fissure-veins; he rather has to take out his ores from more or less decomposed zones of rock containing ore-segregations or crossed by numerous little fractures filled with ores. Even in fissure-veins the fragments of wall-rock, fine or coarse, are mostly still the main material; through this the mineral solution has had to filter either from above or from below. And in this material the solutions had easier play, because the loose rock-fragments in the fissure facilitated the chemical action. Especially if the vein-region was located very deep below the former surface, perhaps under a former sea, the meteoric waters could not penetrate directly from above, but must come indirectly from below by hydrostatic pressure; or the sea itself had access to fissures. We need only remember that in the sea-water, by analyzing the residues in the boilers of transatlantic steamers, nearly half of all our chemical elements have been found (among them, for example, silver); and that chemical compounds are more easily dissolved under pressure and in a higher temperature, and that the temperature in our earth's crust increases one degree Centigrade for every thirty-three meters of depth. But wherever the speed of the mineral solutions was not stopped by impediments—for instance, by the fragments of rocks in the fissures—the sulphides, precipitated in the cooler upper regions, could not be deposited, and hence were lost for mining. The higher the springs had to ascend, the greater was the decrease of pressure and temperature; and as the different sulphides of metals are precipitated from a solution of sulphides of alkalies at different pressures and temperatures, this may, in some cases, explain why in one and the same vein the kinds of metals deposited vary with the depth. As even the deepest mines have not yet reached a depth of four thousand feet, we can not have a great many striking examples for the change of metals with the depth.

Thus we observe, that the circumstances under which ore-deposits came into existence were manifold, for physical and chemical reasons; but that the process of ore-deposition in itself always was the same.

If a fissure strikes through different kinds of rock, it may contain their different leaching products. The same may be the case where fissures cross each other. In such instances, a remarkable change in regard to the quality and quantity of ore may often be observed, and mostly a favorable change, because not only greater quantities, but also different characters, of solutions met at such points; therefore, the chances for a denser precipitation and segregation were greater.

It is well known that the same vein within the same wall-rocks may show a very different distribution of ores. This may be explained partly by the configuration of the foot-wall, forming synclinals and anticlinals (the former having a favorable, the latter an unfavorable influence on the deposition of ore); partly by other irregularities in the fissure and on the wall-rocks; partly by dikes crossing the veins and checking the speed of the solutions; and partly by the different and more or less numerous affluxes from the wall-rocks to the fissure. In this respect, I mention "ore-chimneys" and "ore-pockets."

We find the wall-rocks either fractured, or decomposed, changed in color, bleached, or silicified. Such zones are identical with those from which the leaching products were conveyed into the vein. The solutions could flow through comparatively unhindered until the porosity of the rock was diminished by the increase of decomposition to kaolin or other clayey masses. Then they could pass along main ways only—for instance, on the jointing planes of the rocks, where they sometimes formed a zone of ore-impregnation, such as leads the miner to conclude that a vein is nea:.

Very important for miners and prospectors is an examination of th facilities offered the meteoric waters to penetrate and permeate the rocks. In fissured or fractured rocks, the leaching process was facilitated, as more surface was offered, and the solutions were enabled easily and plentifully to descend to a region of accumulation. A similar effect was caused, if the outcrop of a vein was so situated that the surface waters could freely and plentifully enter. Steep mountain slopes, for instance, will never be so favorable as gentle ones. And if the jointing planes of a sedimentary rock dip toward a vein, this condition must have been better for its development than if they had dipped in a divergent direction. I am sorry to say that our prospectors hardly study such indications.

As we have to take it for granted that the metals contained in veins were principally contained as silicates in the eruptive rocks; as the chemical and physical process of ore-deposition always was the same; and as the water penetrates all kinds of fractures and cavities, it will always be a useless attempt to establish classes of ore-deposits on the basis of the kind of their metals and minerals, or on the basis of the form of the deposits. I can not see any other essential distinction between the ore-deposits than in the manner of their origin, either in consequence of fissures caused by subterranean movements, or *without* fissures, merely by solution, removal, and replacement of the material of their wall-rocks. Thus we may divide the ore-deposits into three main classes: 1. Fissure-veins; 2. Veins of replacement; and 3. Secondary deposits, having been derived from former deposits or segregations. The latter distinguish themselves from the other two classes by not showing periodical segregations of quartz, ores, and spars. To these belong, for instance, the ore-beds deposited in the sedimentary formation; also the lead ore-deposits of the Upper Mississippi, and at Raibl in the Austrian Alps; and the quicksilver deposits in California.

Statistics show that the greater part of the mining in the world is done in the deposits belonging to the last two classes, *not in fissure-veins*. It is strange to find in this country so much prejudice in favor of the fissure-veins. I mention only some of the most famous veins of replacement: those at Leadville, and at Christiania in Norway; the celebrated Veta Madre, near Guanajuato, in Mexico (490 feet thick, with ore-pockets of from 100 to 180 feet thickness).

The time will come when our successors will be enabled by the sum of certain coincidences of geological conditions to predict the presence of certain ore-deposits. It will arrive so much the earlier, the more our mining engineers take pains to elaborate and publish monographs on mines and mining districts and accompany them with correct maps and with statements furnished by competent analytical chemists and microscopists. The U. S. Geological Survey, although only two years old, has already accomplished excellent work—in scientific treatment equal to the work of the geological surveys of the European states, but in regard to practical application superior to them. The published abstract of the report to be issued next year, upon the geology and mining industry of Leadville, Colo., by S. F. Emmons, Geologist in charge of Rocky Mountain Division, U. S. Geological Survey, is a striking example. This treatise will be most highly appreciated by those who are acquainted with the extremely complicated nature of the geology of the region examined.

The purpose of the foregoing essay is to guide mining operators to independent observations; to instruct them how to judge of the reports prepared by mining experts; to induce mining engineers to prepare thorough monographs on their mines; and also to check the absurd worship of fissure-veins.

THE VALUE OF FOREIGN COINS.

Mr. Horatio C. Burchard, Director of the Mint, has issued the following estimate of the values of foreign standard coins:

COUNTRY.	Monetary unit.	Standard.	Value in U. S. money.	Standard coin.
Argentine Rep..	Peso	G. and S.	.96·5	1-20, 1-10, 1-5, ½, and 1 peso, ½
Austria	Florin	S.	.40·1	[argentine and argentine.
Belgium	Franc	G. and S.	.19 3	5, 10, and 20 francs.
Bolivia	Boliviano	S.	.81 2	Boliviano.
Brazil	Milreis of 1000 reis	G.	.54·6	
Brit. Pos. in N. A.	Dollar	G.	1.00·0	
Chili	Peso	G. and S.	.91·2	Condor, doubloon, and escudo.
Cuba	Peso	G. and S.	.93·2	1-16, ⅛, ¼, ½, and 1 doubloon.
Denmark	Crown	G.	.26·8	10 crowns and 20 crowns.
Ecuador	Peso	S.	.81·2	Peso.
Egypt	Piaster	G.	.04·9	5, 10, 25, 50, and 100 piasters.
France	Franc	G. and S.	.19·3	5, 10, and 20 francs.
Great Britain	Pound sterling	G.	4.86·6½	1/5 sovereign and sovereign.
Greece	Drachma	G. and S.	.19·3	5, 10, 20, 50, and 100 drachmas.
German Empire	Mark	G.	.23·8	5, 10, and 20 marks.
Hayti	Gourde	G. and S.	.96·5	1, 2, 5, and 10 gourdes.
India	Rupee of 16 annas	S.	.38·6	
Italy	Lira	G. and S.	.19·3	5, 10, 20, 50, and 100 lire.
Japan	Yen	S.	.87·6	1, 2, 5, 10, and 20 yen, gold, and
Liberia	Dollar	G.	1.00.0	[silver yen.
Mexico	Dollar	S.	.88·2	Peso or dollar, 5, 10, 25, and 50
Netherlands	Florin	G. and S.	.40·2	[centavo.
Norway	Crown	G.	.26·8	10 and 20 crowns.
Peru	Sol	S.	.81·2	Sol.
Portugal	Milreis of 1000 reis	G.	1.08.0	2, 5, and 10 milreis.
Russia	Ruble of 100 copecks.	S.	.65.0	¼, ½, and 1 ruble.
Spain	Peseta of 100 centimes	G. and S.	.19·3	5, 10, 20, 50, and 100 pesetas.
Sweden	Crown	G.	.26·8	10 and 20 crowns.
Switzerland	Franc	G. and S.	.19·3	5, 10, and 20 francs.
Tripoli	Mahbub of 20 piasters	S.	.73·3	[ters.
Turkey	Piaster	G.	.04·4	25, 50, 100, 250, and 500 pias-
U. S. of Colombia	Peso	S.	.81·2	Peso.
Venezuela	Bolivar	G. and S.	.19·3	5, 10, 20, 50, and 100 bolivar.

THE PRESSURE OF GAS IN THE SOLID COAL.—M. E. Mallard, referring to Mr. Lindsay Wood's experiments showing the pressure of gas in the solid coal, says that the theory put forward by Mr. Wood, that the maximum pressure of the gas varies as the square root of the depth of the hole, he considers approximative only, and goes into an elaborate calculation to show that it would require to be somewhat modified. These formulas are carried out and the results placed alongside the actual pressures observed, to which they very closely assimilate. He considers that the experiments show that the coal must have been formed and covered before, and even long before the formation of the gas, since the overlying strata must at the time have had sufficient thickness and strength to resist its pressure. Where the seam of coal is exposed to the air at its outcrop, the fire-damp expands at first rapidly, and lastly almost inappreciably into the atmosphere; but the seam may be divided into distinct and separate divisions by faults, in some of which gas may be found, while closely adjacent divisions contain none. The pressure of gas may also vary on account of variations in the permeability of the coal in different places. In conclusion, he considers the experiments fully explain the mode in which the sudden outbursts of gas occur in Belgium, and finishes by saying that the most useful thing to do now is, to determine by experiments the quantity of gas exuded from the coal, and the relative permeability of the coal in a number of mines; that is, the volume of gas given off per unit of surface at the face at any time, and the coefficient of permeability of the coal with respect to the gas.

A SAFE SAFETY-LAMP.

M. Marsaut, member of the Société de l' Industrie Minérale de Saint Etienne, has been experimenting with various so-called safety-lamps, especially the Mueseler, with a view to ascertain why it is that they do not afford an absolute guarantee of safety. He found that, in a state of repose in an explosive mixture of air and gas, the explosion which takes place under the diaphragm of the Mueseler lamp and which generally extinguishes it, passes through the diaphragm on an average fifteen times in a hundred, and communicates the explosion to the exterior almost once in every hundred times. The number of times that the flame passes through the diaphragm is nearly fifty per cent of this number in a certain series of tests, and explosions occur on the outside in five per cent of the cases. This discovery easily accounts for many accidents, the causes of which have until now remained a mystery. As the results of these investigations, M. Marsaut has constructed a modified type of lamp in which no less than 5500 explosions have taken place without their being communicated to the outside, and under conditions in which the other lamps, including the Mueseler, failed to stand the test. The special feature of this new lamp is a metal shield formed by a hollow cylinder of sheet-iron, closed at the top by wire gauze, which completely surrounds the ordinary gauze of the lamp. At the lower portion of the shield is a series of apertures which permit the air necessary for supporting combustion to enter the lamp. This air, in order to reach the flame, must follow a tortuous course, and thus the danger caused by oblique, downward, and rapid currents is completely neutralized. The horizontal diaphragm, which is one of the characteristics of the Mueseler lamp, is suppressed, and is replaced by a simple washer for supporting the chimney. A wire gauze with 929 meshes to the square inch completely envelopes the chimney of the Marsaut lamp, and takes the place of the diaphragm in the Mueseler.

THE SIEMENS DIRECT PROCESS.

Mr. James Davis, mill manager of the New Steel-Works, Landore, Wales, writes as follows to the *Engineer:* In this letter I desire to embody the result of a long practical experience of the working of Siemens's direct process, by making wrought-iron directly from the ore, and of making metallic iron for the Spongy Iron and Purifying Company, at Landore and Towcester respectively.

The ore to be smelted is broken up into fragments not exceeding the size of peas or beans; to it is added lime or other fluxing material, in such a proportion that the gangue contained in the ore and flux combines with only a little oxide of iron into fluid slag. A charge, say 20 cwt. of ore, 12 cwt. of roll or hammer-scale, together with 6 cwt. of soft free coal well mixed together, is charged into the furnace when fully heated. The coal is charged with the ore; during the first hour, very little gas is required; but after this, the rotative velocity is increased, together with the heat, for a short time. At this stage, a rapid reaction is the result; the peroxide of iron, being reduced to magnetic oxide, begins to fuse, and at the same time metallic iron is precipitated by each piece of carbon while the fluxing materials form a fluid slag with the siliceous gangue of the ore. The slow rotative action is again resorted to, whereby the mass of iron is turned over and over, presenting continually new surfaces to the heated lining and to the flame within the rotator. As soon as the metal is gathered together a little, the slag is tapped, which brings with it sulphur and phosphorus. The velocity at this point is increased to one revolution in five minutes, so as to gather up the loose masses of iron into five or six metallic balls. These are taken and shingled with a steam-hammer or squeezers into a bloom, which, when reheated, will roll into a bar similar to an ordinary puddled one. I may say that the balls must be worked as quickly as possible, and then the product will stand as much work as common puddled iron.

With reference to the amount of coal used in the producers, the abstract report shows that I have succeeded in making what Dr. Siemens said could be done in his paper before the Mechanical Engineers in 1873, that is, one ton of iron made to one ton of producer coal used. With the direct process, I would suggest that Siemens's open-hearth furnaces are worked in connection with this process, as all the small ore can be utilized and the blooms can be used also to a great advantage and profit. As regards the statement made by Mr. G. W. Maynard, that the blooms are only fit for the open-hearth furnace, I must differ, as I have worked the blooms which have been rolled into good merchant bars. The following is the analysis: Iron, 99·1988; silicon, ·400; carbon, ·150; phosphorus, ·0502; sulphur, trace; manganese, ·201; fracture, good.

A great deal has been said respecting the class of bricks to be used in the lining of these rotative furnaces. Experience has proved that the drum should have a 3½-inch fire-brick all around, the ends to have a few bauxite or magnesia bricks just where the balls are mostly wearing. After testing the magnesia bricks made at Landore side by side with the bauxite, I find that the magnesia stand the best. Added to this is an oxide lining of about 2 inches in thickness, made with scale and ore. Then I venture to state that, with proper care and management, the rotators can be kept in working order for at least three months without stoppage; at the end of that period, probably the rings may want renewing, which would only cause a delay of about three days; so that, the cost being so low and the output good, as the table shows, it must necessarily be a commercial success. It has been proved beyond doubt that the chemical results are all that could be desired.

The furnace is arranged in the following manner: The gas is made in two ordinary Siemens producers, size, 8 feet by 7 feet by 7 feet, which are at the back of the regenerators. The gas comes through a fire-brick flue straight into the furnace. There are two chambers filled with bricks forming a checker-work from top to bottom, size, 19 feet 6 inches high, by 7 feet 6 inches wide, by 10 feet long. These are called regenerators, and are worked alternately, the waste heat from the furnace passing through first one chamber, and then the other, for certain periods, making the checker-work hot; by this means, we get hot air, and thus the furnace is heated to a high temperature. The drum or rotator is 10 feet 4 inches diameter inside, and 10 feet 4 inches long; there are four 1¼-inch diameter pipes for circulating water front to back, keeping the tubes cool, which have two large bends in for turning over he metal and for dividing it into five or six balls.

This is one of the greatest improvements that has been made since the working of plant at Towcester, as there is no danger now of having a sliding charge. There is also a water cylinder at the back of the furnace, connected with the front by means of the four 1¼-inch pipes, which serves as a reservoir, for keeping top pipes full of water, and especially for keeping the ring and back end of the furnace cool.

The furnace is revolved on four wheels, driven by a small pinion, working in a large spur-wheel, which is in segments, and fixed to the furnace by means of brackets. The furnace is carried on a movable carriage for convenience of removing, for repairs, etc. The charge is taken up by elevators, and deposited in a tank during the time the furnace is working, and when ready to charge, a slide is removed, and the furnace is charged in about ten minutes.

Abstract Reports of Rotator at Landore.

I give the following as an approximate cost of a ton of iron made by this process—that is, by working two rotators jointly:

	£.	s.	d.
Small Sommerostro ore, 1 ton, at 8s. per ton	0	8	0
Hammer or roll scale, 12 cwt., at 10s. per ton	0	6	0
Producer coal, 1 ton, at 7s. per ton	0	7	0
Reducing coal, 6 cwt., at 6s. per ton	0	1	9
Repairs and sundries, at 5s. per ton	0	5	0
Wages for labor, at 5s. per ton	0	5	0
Total	£1	12	9

NEW PUBLICATIONS.

ANNUAL REPORT OF THE COMMISSIONER OF MINERAL STATISTICS OF THE STATE OF MICHIGAN FOR 1881. Lansing, Mich. 8vo, pp. 266. (*Ind'x.*)

Mr. Charles E. Wright's second annual report as Commissioner of Mineral Statistics of the State of Michigan is in many respects an improvement on the first so far as fullness of details concerning the copper and iron mines of the State are concerned. We have been particularly interested in the review of work in the copper mines, which we understand is from the pen of Prof. C. D. Lawton, because it is the only record of that kind which we possess in that form. The iron mines of the State have a very experienced and reliable local historian in Mr. Swineford, editor of the Marquette *Mining Journal*, whose annual review largely anticipates that of Mr. Wright. Both are valuable, and supplement one another so well that we would not like to miss either. Mr. Wright's report, although ostensibly for 1881, in reality gives the condition of the mines six months after the close of that year. The greatest interest, of course, attaches to the developments in the younger districts, some of which have rushed into prominence during the last few years. There are full accounts of the work done in the mines of the Teal, the North, and the Cascade ranges, the great Menominee range, the Felch Mountain, and the Agogebic districts, the latter two being the latest fields opened by prospectors.

The report on the copper districts is very full and complete, and is elaborated in much the same manner as it was during the preceding year. It shows a very great activity in the mining industry of that section, and gives promise of even greater returns during the coming year. We are informed by the very best of authority that the Lake mines will this year come very near a product of sixty millions of copper. The majority of the large producing mines have increased their output. Next year will witness a further addition, as the Conglomerate is getting ready for a large output, the Phœnix will do well, the Peninsula is equipping for 200 tons of rock per day, and the Wolverine is starting in in a moderate way.

We notice, with pleasure, that Mr. Wright has this year added gypsum, sandstone, clay, and coal to the subjects treated. So very little is known concerning the occurrence of coal in Michigan, and so little has apparently been done to develop it, that the opinion quite generally prevails that Michigan has no mineral fuel. The extent of the Michigan coal-field is embraced in a circle with a radius of fifty miles, having its center southeast of the village of St. Louis, in Gratiot County, and its southern boundary passing a few miles south of the city of Jackson. The coal formation has an estimated maximum thickness of about 300 feet, and what little exploration has been carried out has proved the existence of one workable bed, running as high as 4 feet in thickness, but averaging generally not more than from 2½ to 3 feet. The first discovery of coal dates back to 1835, when it was found in Spring Arbor township, Jackson County, and that mine, called the Hayden, was worked for some time; in 1857, a new mine, the Woodville, was opened near it, and some work was done for many years by the Detroit & Jackson Coal Company, which, however, shut down in 1872. Mining was resumed by lessees, R. H. Emerson & Co., in 1881. In 1879, a company was formed, called the Michigan, near the Woodville, and although considerably troubled by water, mining is going on as steadily as the car supply and the market will allow. The largest Michigan coal mine is

Digitized by Google

the Slope, opened in 1879, when 54,635 net tons were produced. In the following year, the output rose to 74,743 tons, but in 1881 fell off to 69,066, because the buildings were destroyed by fire. The only other mine working in Jackson County is the Eureka, begun in 1879. The total product of the county for 1881 is estimated at 130,530 tons. The only other mines in the State which are now in operation, besides those mentioned, are near Corunna, Shiawassee County. Work was done in a desultory way for many years until, in 1870, Youngstown capitalists took hold. The caving in of the shaft in 1875 stopped mining until, in 1878, a new mine was opened near the old one, but which proved unprofitable. In 1881, the sinking of a new shaft was begun under more favorable auspices. It is not expected that the coal mines of Michigan will ever possess more than a local importance. Still, it is of interest to note that this State, even though in a modest way, should rank among the coal-producing States in the country.

POWER versus HAND-DRILLING ON LAKE SUPERIOR.

Mr. Frank Klepetko, of the Northwest mine, now belonging to the Conglomerate Mining Company, of Philadelphia, has furnished the Commissioner of Mineral Statistics of Michigan with some interesting figures on the comparative cost of drifting by hand and by power-drills on the amygdaloid of that mine. These will supplement the data which we printed in our issue of August 29th, 1882, page 221, on the comparative cost on conglomerate rock.

The following table gives the comparative cost of drifting on amygdaloid:

Items.	Drifting by hand.	Drifting with power-drills.
Day's labor per foot (men)	$4.79	$2.18
" " (boys)		.53
Contract cost per foot	11.95	10.04
Cost supplies per foot	2.07	4.12
Less profit on supplies, 25 per cent.	.52	1.03
Net contract cost per foot	11.43	9.01
Compressor cost per foot		1.64
Interest on compressing plant		.62
Total cost per foot	11.43	11.17
Wages earned by miners per day	2.06	2.50
" " boys "		.96

The wages were high, because the mine, at that time, in 1880, had not been working regularly, and better rates had to be offered to induce men to work. The compressor cost includes repairs on compressor and drills, wages of the men running the compressor, fuel, oil, packing, etc. The cost per foot drifted was obtained by dividing the compressor cost for the seven months that the Rand drills were running, by the entire number of shifts worked by the miners with the drills. This quotient was multiplied by 2·18, the number of shifts to each foot drifted. The cost is high because the full number of drills was not run continuously; but on the other hand, the repairs were light. The interest on compressing plant was obtained by reckoning interest at 10 per cent for seven months on $15,000, including the whole plant and 10 drills. In 104 shifts, in one month, the advance was 21·07 feet for drifting by hand, and 47·07 feet by drills, or 2·2 times as much. The apparent saving is 26 cents per foot in favor of the drills, not taking into account the increased speed. This reduces the fixed expenses, such as salaries, pumping, etc., equal to a saving of $3000 per annum. An allowance must also be made for the fact that the hand drifts are carried through 6 feet by 5 feet, while the machine drifts are 7 by 8 feet or more. In ore-bearing ground, this amounts to an increase of excavation of from 3000 to 5600 cubic feet of rock per 100 feet of drift run, or 12 cubic fathoms. In the case of the Northwest, this would amount to $15 per cubic fathom, or $1.80 per lineal foot, which would reduce the cost of drifting with power-drills in ore ground to $9.37 per foot, or $2.06 less than hand drifts.

The following figures show the comparative cost of stoping with Rand drills when the work is done by contract by the fathom or by contract by the foot of hole drilled:

	By fathom, contract.	By length of hole, contract.
Day's labor per fathom (men)	$2.38	
" " " " (boys)	.98	
" " " " (miners)		$1.71
" " " " (blasters)		.35
" " " " (boys)		.60
Contract wages per fathom stoped	5.54	3.30 (cost of holes)
Wages paid to blaster and helper		1.06
Supplies used by miners	5.77	.33
Supplies used by blasters		6.21
Compressor cost per fathom stoped	1.79	1.28
Interest on compressor plant	67	.48
Total cost per fathom stoped	13.77	12.76
Less profit in supplies, 25 per cent.	1.44	1.63
Net cost per fathom	12.33	11.03

In contracts per foot of hole drilled (12 cents per foot), the miners furnish light and the oil for the drill, while the company pays for power-drills, caps, and fuse, and hires the charger, who measures the depth of the hole when he inserts the charge. In contracts by the fathom, the men pay for all the supplies, and the company only furnishes the drills and the power to run them. By the latter method, the men earn $1.93 per day, as against $1.68 by the former; the quantity of rock broken per drill and four men being 43·7 for the fathom contract to 60·8 for the other.

THE BULL DIRECT PROCESS.

A process for manufacturing iron and steel directly from the ore, invented by Mr. H. C. Bull, is attracting some attention in England. The furnace is worked exclusively with gas, delivered into it in a very highly heated state directly from the producers. Highly heated air is also introduced in sufficient quantities to burn about 10 per cent of the gas, and maintain the furnace at the high temperature necessary to allow the withdrawal of the iron or steel and cinder in a fluid state. Under this system, the gases rising through the ore and flux are carbonic oxide and hydrogen, in equal volumes, together with the nitrogen derived from the air which is blown into the furnace. These gases being produced entirely outside the furnace, there is no zone of gasification, but only the zones of fusion, reduction, and carbonization.

During the year 1881, the Société John Cockerill, of Seraing, Belgium, built an ordinary blast-furnace 6 feet in diameter in the bosh, and 21 feet high, fitted with Cowper hot-air blast stoves, and ordinary water-gas producers of the cupola type, when 3534 kilograms of iron were produced in twenty-four hours, under this process with the gas, as against 645 kilograms by means of the ordinary blast-furnace without the gas. The silicon was reduced from 3·40 to ·15, the sulphur from 1·61 to ·33, the phosphorus from 1·76 to 1·10, the manganese to *nil*, the combined carbon to ·52, and the graphite to ·17, which proved that the mildest grades of ingot iron and steel, suitable for rails, cutlery, and the highest class tools, could be produced from the most inferior ores directly in the blast-furnace. At the same time, the output from the furnace was increased enormously, and the quantity of fuel required was decreased in almost the same ratio.

THE WHITWELL STOVE FOR CHARCOAL FURNACES.

Mr. Horace E. Burt, manager of the Martel furnace, St. Ignace, Michigan, has written a very valuable letter giving the result of the work of Whitwell stoves for a charcoal furnace. This letter was contributed to the Charcoal Iron-Workers' Association, and is printed in the last issue of its well conducted *Journal*. Mr. Burt says:

This furnace is 53 feet by 10 feet 6 inches. There are two Whitwell stoves, each 60 feet by 15 feet. The fuel used is charcoal, made in round kilns, constructed of brick, arched or dome tops. These kilns, 30 in number, are located, 10 at Allenville, twelve miles distant, and 20 at Johnson, twenty-five miles distant from the furnace. The coal is transported in box-cars, and the receipts of one day used the next, being unloaded directly from the cars, over screens, into the coal-charging buggies. All coal, as well as all the ore, is weighed in the charging-buggies, on scales provided for the purpose.

The furnace was put in blast August 16th, 1881. Stoppage occurred at noon on the 25th, owing to an accident to the hoisting machinery, and continued until eight P.M. on the 29th. At time of stopping, the temperature of blast was 1000°. On starting up, the temperature was 800°, the result of extra firing with wood in the largest combustion-chambers of the stoves. In the following week, the temperature of blast went up to 1300°, when 266 tons of iron were put out with a consumption of 90 bushels charcoal to the ton of iron. Up to the end of September, 1882, the furnace had been in blast $322\frac{11}{24}$ working days, averaging about 40 tons of pig-iron per day for the time in blast. The $87\frac{13}{24}$ days of idleness cover stoppages for Sundays and for flue cleanings, and want of charcoal, including the 4 days and 8 hours for repairs, previously mentioned. I will give you a summary for the month of September last past:

In blast 24 days and 14 hours.

Ore used, 3,571,200 pounds; percentage of yield, $59\frac{6}{10}$.

Coal used, 1,420,250 pounds = $1494\frac{1}{2}$ pounds per ton of iron.

Pig-iron produced, 2,148,090 = $950\frac{1080}{2240}$ tons pig-iron.

Of this output, $3\frac{1}{2}$ per cent was No. 1; $57\frac{1}{2}$ per cent, No. 2; $19\frac{1}{4}$ per cent, No. 3; 10 per cent, No. 4; $9\frac{1}{4}$ per cent, No. 5; and $\frac{3}{4}$ per cent, No. 6, pig-iron.

As to the temperature of the blast, the last week of September is a fair sample of each week in that month. On Monday, at one o'clock A.M. (time of putting on blast), the west stove showed 900°; at six A.M., the same stove showed 1200°, after one change; at midnight, the same stove showed 1400°. The east stove kept pace with the west. There are regularly 12 changes in 24 hours. On Tuesday, the temperature, lowest, 1400°—highest, 1460°; on Wednesday, the temperature, lowest, 1440°—highest, 1460°; on Thursday, lowest, 1440°—highest, 1480°; on Friday, lowest, 1440°—highest, 1500°; on Saturday, lowest, 1440°—highest, 1480°. The vertical flues of the west stove have never been cleaned. In the east stove, after running six months, no dirt or soot was found, and the stoves respond as readily to the burning gas as they ever did.

It may not be generally known that this furnace was constructed with the settled purpose of resting on Sunday. In accordance with this principle, growing out of the religious convictions of the proprietors that it was their duty as Christian men, in the furnace business as well as in all other kinds engaging them, to rest the furnace and their employés on the Christian Sabbath, it has been the practice to cast at eleven o'clock Saturday nights and put the furnace in course of Sabbath observance by midnight, and so continuing until twelve or one o'clock on Monday morning. This practice has given general and positive satisfaction to all concerned, and I most cordially recommend the same to all furnace men. With the Whitwell stoves, it is entirely practicable. I deem it small excuse for any one with means ample for the construction of a modern furnace plant, to allow the extra expense of these stoves over cast-iron or any other than fire-brick stoves to stand in the way of the possibility of Sunday stoppages. It has been thought that the high temperature of the blast would prove injurious to the product. On the contrary, so far as our experience goes, no stronger iron is made. We are aiming to make the best brand of car-wheel and malleable iron, from Lake Superior ores, to be found anywhere.

As to strength, a test piece of size suitable to be tested in a Thurston torsion testing-machine, cast in the pig bed and broken from the under side of a soft 2-chill pig, on May 31st, is reported to have been turned up in the center to $\frac{5}{8}$ diameter × 1 inch long, and placed in D. F. & Co.'s machine at Erie, with the following result: 30,000 pounds per square inch tensile strain and 14° deflection before breaking. The cast from which this was taken was made on a temperature of 1360 of blast, the engine making 16 and 17 turns.

There is one matter which I am inclined to touch upon before closing. At the last annual meeting, I noticed the discussion as to the value of dolomite as a flux. We have used nothing else since going into blast. Our limestone is quarried within a quarter of a mile of the furnace. It shows by analysis 55·55 per cent of carbonate of lime, 41·72 per cent of carbonate of magnesia. We are using about eighty-eight pounds to the ton of iron, a very low percentage. It may be, some of the members can vouch for the correctness of my theory, that while dolomite is an excellent flux for the ores I am using, it is the active enemy of the hearth-bottom, which has during the time of this blast been eaten out to a depth of eighteen inches. The hearth-bottom was originally a double layer of eighteen inch brick. It has been found necessary to drop the casting-trough low enough to draw off the iron from the surface of the first layer of bottom brick.

GENERAL MINING NEWS.

ARIZONA.

COCHISE COUNTY—TOMBSTONE DISTRICT.

Recent dispatches state that work on the Phœnix mine has been resumed. This mine adjoins the Stonewall and Contact mines, and bids fair to become a good producer. The force of miners on the Lucky Cuss has been reduced. There is enough ore in the bins to keep the smelter running for two months. The hoisting-works from the French mine, at Harshaw, are on the road to this point, for the Ingersoll mine. Thirty-three tons of ore from the Little Devil netted $1100, after all expenses were paid, at the Head Center mill. The Bunker Hill, Rattlesnake, and Mammoth claims were sold a few days ago for $60,000. Work on the Grand Central South is to be resumed on the return of Lieutenant Hall. The Gilded Age has resumed work.

GILA COUNTY.

MACK MORRIS.—Work has been stopped on this mine, and the company is taking ore out of the La Plata, an adjoining claim.

OLD DOMINION.—Operations at the smelting-works are satisfactory, and the mine offers an abundance of ore. A dispatch says that Colonel Newcomb, of the Emeline Mining Company, and Frank Simpson, who is interested in the Old Dominion Copper Company, are now there examining the mines.

TACOMA.—This property shows good prospects. The company has leased the Carrie furnace, and is accumulating ore and coke on the dump, with a view to produce copper at an early day.

CALIFORNIA.

The San Francisco *Bulletin*, in speaking of the mining interests of California, says that the past year has been one of fair prosperity. The quartz claims have averaged well. The gravel claims have been embarrassed to some extent by the *débris* question. The product of some of these claims this year has been much less than formerly. If the mine-owners can devise some way of taking care of the sand washed down in the pursuit of gold, their work will go on the same as of old. But until that question is settled, and settled in a way satisfactory to agriculturists, there will be impediments to the full and free development of the gravel claims of the State. Quartz mining holds its own quite well, and is likely to be one of the prominent industries of the State for some time. Mines of this character are now open in about twenty counties. The facilities for getting the rock and extracting the precious metal are every year becoming perfected and cheapened. During the past year, 68 mines levied 121 assessments, amounting to $1,547,467; in 1881, 93 mines levied 151 assessments, amounting to $2,237,850. The total amount of dividends paid in 1882 amounted to $1,715,408, as against $2,654,784 paid in 1881.

INYO COUNTY.

INYO CONSOLIDATED.—The mill at Darwin was burned to the ground on the evening of December 19th. It was erected in 1874–75 by the Surprise Valley Water Mining and Milling Company. It is said to have cost the present management about $50,000, and was insured for $40,000.

PLUMAS COUNTY.

TAYLOR-PLUMAS.—The mill is almost finished, and will start up early in January. In the mine, work is pushed ahead as rapidly as possible, and new ground is opening up that will supply a large amount of ore as soon as needed. The ledge continues to maintain the same average width, and looks as well as heretofore.

CANADA.

NOVA SCOTIA.

BOSTON & HALIFAX.—This company, whose property adjoins the Hall-Anderson, has contracted for its machinery, and it is expected it will be in place when the road is finished, or soon thereafter.

HALL-ANDERSON.—Despite the late fall of snow of about fourteen inches, the work on the government road to the Hall-Anderson mine is still in progress. It is expected that it will be finished in the next sixty days. The new hoisting-works are now in operation, and the Orion lode is steadily improving. The mill is temporarily idle to admit of putting in a new heater for the water supply for the batteries.

NONPAREIL.—Active developments on the Nonpareil property, which also joins the Hall-Anderson immediately on the west, are in progress, and the Leslie lode, which is partially developed on the Hall-Anderson, has been tapped at various points covering a distance of six hundred feet. The lode is about two feet thick, and in every opening, thus far, shows free gold in paying quantities.

OXFORD.—The Oxford Company has received a gold brick of $2550 from ten days' run of its ten-stamp mill. The contract-work for sinking the main shaft seventy-five feet deeper is now in rapid progress, with the aid of the new steam-pump, which is working satisfactorily, and the lode is gradually increasing in width and quality. A test lot of ore from the newly-discovered Split lode will be milled, and, from the appearance of the quartz, large results are expected. Sinking has been commenced upon the Oxford lode, and the company is preparing to put hoisting-works upon the same.

STATHER.—Recent developments upon the Stather property which lies north and west of the Oxford, prove it to be of extraordinary promise. Negotiations are in progress for the purchase of this property, and it is expected that in the spring twenty stamps will be in operation thereon. From the developments thus far, this district seems destined to mark a new era in Nova Scotia gold mining, from the fact that, whereas in other districts the gold is notably coarse, it is here fine gold as a rule, and the milling results of the ore prove the yield to be much more uniform than in any other district in the province.

COLORADO.

The Denver *Tribune* gives the following table of the bullion product of Colorado for 1882:

County.	Amount.	County.	Amount.
Boulder	$550,000	La Plata, San Juan	$675,000
Chaffee	225,500	Ouray	329,760
Custer	705,116	Park	283,564
Clear Creek	2,001,629	Pitkin	100,000
Dolores	125,000	Rio Grande	310,000
Fremont	19,980	Routt	100,000
Gilpin	2,006,516	Saguache	52,000
Grand	10,000	Summit	1,250,000
Gunnison	600,000		
Hinsdale	275,000	Totals	$26,750,898
Lake	17,131,853		

The product for 1881 was $22,203,509, showing an increase this year of $4,547,389.

The following statement shows the business of the smelting-works named during 1882:

Golden Smelting-Works, Golden.

County.	Tons.	Gold.	Silver.	Lead.	Total.
Clear Creek	1,921	$4,133	$282,335	$33,386	$319,854
Gilpin	3,602	117,380	38,940	10,320	166,641
Boulder	463	66,141	25,213	....	91,354
Lake	812	....	32,296	23,422	55,718
Summit	75	....	7,702	2,503	10,205
All other sources	106	3,249	7,492	4,644	15,386
	6,979	....	....	....	$659,161

Boston & Colorado Smelting-Works, Argo.

County.	Gold.	Silver.	Copper.	Total.
Gilpin	$364,000	$98,000	$93,000	$555,000
Clear Creek	26,000	509,000	23,000	558,000
Boulder	140,000	82,000	....	222,000
Lake	....	336,000	....	336,000
Summit	....	443,000	....	443,000
Park	6,000	96,000	....	102,000

San Juan country	4,000	83,000	8,000	95,000
Montana	7,000	538,000	159,000	704,000
Utah	12,000	85,000	84,000	181,000
Arizona	....	16,000	2,000	18,000
New Mexico	....	59,000	7,000	66,000
All other sources	2,000	21,000	7,000	30,000
Total	$687,000	$2,595,000	$386,000	$3,668,000

The production for 1881 was $3,081,000; increase this year, $587,000.

Miners' Smelting-Works, Golden.

County.	Gold.	Silver.	Copper.	Total.
Lake and Park	$2,350	$166,060	....	$168,410
Gilpin	105,763	19,500	$12,850	138,113
Clear Creek	32,350	291,285	17,134	340,769
All other sources	14,270	20,430	15,648	50,348
Total	$154,733	$497,275	$45,632	$697,640

Moore Mining and Smelting Company, Golden.

The statement published below is from the 1st of January, 1882, to the 31st of October, 1882, the works having closed down at that date for the purpose of changing and enlarging their capacity:

County.	Tons.	Gold.	Silver.	Lead, Copper.	Total.
Gilpin	3,410	$72,740	$59,857	$4,528	$137,126
Clear Creek	1,166	2,742	223,712	9,276	235,730
Lake	800	3,605	34,742	7,655	46,003
All other sources	665	....	70,792	2,750	73,542
Total	6,041	$79,087	$389,103	$24,209	$462,401

The production for 1881 was $678,505.

Grant Smelter, Denver.

The production of these works for seventy days of 1882 was as follows:

Locality.	Gold.	Silver.	Lead.	Totals.
Arizona	....	$123,000	$3,000	$126,000
New Mexico	$20	10,000	600	10,620
Idaho Territory	....	500	200	700
Clear Creek County	400	1,600	1,200	3,200
San Juan County	4,000	17,200	6,100	27,300
Chaffee County	200	4,000	2,000	6,200
Pitkin County	....	2,200	1,700	3,900
Custer County	18,300	5,600	400	27,300
Park County	3,100	7,100	2,600	12,800
Summit County	300	4,500	2,800	7,600
Ouray County	800	12,300	2,500	15,600
Gilpin County	....	3,500	300	3,800
Gunnison County	....	900	300	1,200
Boulder County	800	300	700	1,800
Lake County	....	558,000	512,400	1,070,400
All other sources	1,500	16,000	4,300	21,800
Grand total	$29,420	$766,700	$541,100	$1,337,220

BOULDER COUNTY.

WARD H. LAMON.—This lode, the extension of the Mountain Lion mine, is worked extensively. It is yielding immensely, the nature of the mineral being a very soft, decomposed pay, over a foot wide, milling 15 ounces gold per ton.

CLEAR CREEK COUNTY.

The bullion production of this county for the year 1882 is said by the Georgetown *Miner* to have amounted to $2,001,629.

DIAMOND TUNNEL.—The tunnel has cut a five-foot vein of mineral at its intersection with the Corry City lode, which assays from 42 to 821 ounces silver per ton. Work will be begun on the vein as soon as the tunnel head is far enough advanced to admit room.

LAKE COUNTY.

The following table gives the bullion output of Leadville for the year ended December 30th, 1882:

Quantity.

	Pounds of bullion.	Pounds of lead.	Tons of ore.	Ounces of silver.	Ounces of gold.
Total first quarter	23,487,182	23,380,743	12,924	2,042,323	3,056
Total second quarter	20,510,096	20,415,647	12,175	1,838,596	2,886
Total third quarter	22,713,006	22,605,015	28,050	1,743,876	6,548
Total fourth quarter	19,747,065	19,646,027	36,953	1,648,454	3,923
Total for year 1882	86,457,349	86,047,412	90,101	7,273,249	16,413

Value.

	Value of lead.	Value of silver.	Value of gold.	Value of ore.	Total value.
Total first quarter	$1,169,037	$2,328,248	$61,120	$485,762	$4,044,167
Total second quarter	1,020,779	2,093,301	49,720	599,059	3,773,772
Total third quarter	1,130,251	1,988,142	130,960	1,326,111	4,575,334
Total fourth quarter	942,977	1,827,561	78,457	1,885,134	4,734,129
Total for year 1882	$4,263,044	$8,237,252	$320,257	$4,296,066	$17,127,402

Total for 1881 amounted to $13,170,576, showing an increase this year of $3,956,826. In figuring the commercial value of the last quarter's product, silver is calculated at $1.11 per ounce, and lead 4·8 cents per pound. Previous productions were calculated on a fair average of the ruling quotations at the time.

CHRYSOLITE.—The results obtained in the recent concentrating experiments are said to be satisfactory. They show that a high percentage of lead is saved; that working without settlers or buddling a fair percentage of silver is saved; and that the ore is beneficiated, that is to say, silica is lost and the percentage of iron increased. The experiment has been made on lots of ore weighing over one hundred tons in all. As a rule, eight tons have been concentrated into one. The result on one lot of forty-five tons yielded the following results: The original lot assayed in silica 36 per cent; in iron, 25 per cent; and in lead, 2 per cent. The concentrates assayed in silica 18 per cent; in iron, 30 per cent; and in lead, 15 per cent. The concentrates have been sold to Cummings & Finn as fast as made.

SAGUACHE COUNTY.

HORTENSE.—Another strike is reported. Out of 500 pounds of ore, the mill returns gave 1017 ounces in gold and 524 in silver, aggregating over $20,000.

SUMMIT COUNTY.

GREER SMELTER.—Operations will be resumed shortly. The smelter is closed at present for the purpose of putting in jigs.

WHITE QUAIL.—It is stated that this company will resume work.

DAKOTA.

CALEDONIA.—The superintendent reports for the week ended December 24th: Ore produced, 1050 tons. Header advanced five feet; total, twenty-six feet. North drift advanced eight feet; total, thirty feet. Have let contracts to run header and drift, as it can be done cheaper than by day's pay.

FATHER DE SMET.—The superintendent reports under date of December 19th,

Digitized by Google

as follows: Herewith express company's receipt for bar No. 149, containing 1263 $\frac{53}{65}$ ounces gold bullion, the result of run of mill for the first half of December. On the 15th, I drew for $21,500, which amount was for all expenses of November. The mill is doing good work. The rock-crushers require much repairing, on account of the hardness of the ore we are now working. The mine is looking well at all points where work is done, and good results may be expected during the winter.

IDAHO.

The business depression, says the Idaho *Avalanche*, which has existed in the community for the past two months by reason of the condition of the roads, has ceased, and we can now look forward for some activity in mining matters.

IDAHO DEMOCRAT.—The shaft is down 105 feet, in the ledge, which shows up five feet in width, one foot of which is solid galena. At the depth of 60 feet, the shaft is intersected by a tunnel, which secures good ventilation.

MAINE.

SULLIVAN.—The mill has shut down for the winter, after a successful run of several months. Work in the mine is at present concentrated in the Waukeag shaft, which is driven night and day by three eight-hour shifts. The present depth is about 360 feet. Twenty-five men are employed.

TWIN LEAD.—The directors held a meeting in Bangor recently, at which it was decided to resume operations at the mine at once. A large force will at once be put on, and work will be carried forward vigorously.

MEXICO.

The Magistral Copper District, in the Magistral range, 25 miles north of Chihuahua, on the line of the Mexican Central Railroad, under recent developments, is reported to be yielding ore assaying 60 per cent copper and 1300 ounces silver to the ton.

From Vaca Ortiz, Durango, Mr. George Wilson writes us, under date of December 7th:

Within the last few weeks, the usual winter influx of miners and prospectors, driven from the north by snow and cold, has begun to reach this more favored section of the great mining region of the Rockies. Many capitalists, seeking for good and, at the same time, cheap mines, have also put in an appearance, some of whom have bought, others bonded, and still others have already begun work on their pr perty. At Guanacevi, the Peoria (Illinois) Company, under the able control of Messrs. Gift, manager, and Hotchkiss, superintendent, is making fair progress, and its operations are meeting with the most gratifying results. On one of its seven mines, the Leon, it is driving a tunnel or drift on the course of the vein, showing up from 10 to 12 feet wide of ore. The assays from this mine have so far run over 200 ounces per ton; sometimes over 400 ounces silver per ton has been the yield. Above this drift, it has over 500 feet of ore in hight, by 2000 feet along the vein, which has been thoroughly proved along its outcrop by numerous shafts from 50 to 100 feet deep. The company has six other mines, all of which are known to be valuable, and by good miners who know each one they are said to be each as valuable as the Leon. This company was the pioneer in Guanacevi, and was fortunate enough to secure its property for less than $300,000; and the actual cost of the work which has developed such a noble ore-body does not exceed $5000. Within the last week, over thirty mines have been bonded or bought in Guanacevi, and it seems as if it would prove the Comstock of Durango.

At Metates, the famous Candelaria seems about to enter on a new period of prosperity. In the hands of its late Mexican owners, who were completely sated by its twenty years of rich yields, the proper development-work in advance of ore-extraction had been somewhat neglected, and with the usual results of such a course; but under the new administration, the most satisfactory results are becoming apparent. In the lower tunnel, which, near its northern extremity, was driven at first on 100-ounce ore, the mineral has recently improved to from 800 to 1000 ounces silver per ton, with a 15-foot face in the drift. The present owner has, in less than two months' work, paid off the arrears of debt of the previous year, left him as a legacy by the former owners. The neighboring mines are opening up with good results, and here again is an excellent opportunity for investment in mines which will pay "to work" as well as "to sell."

Northern capitalists have also been here recently, looking up the prospects for successful cattle-raising, and so thoroughly well pleased were they with the outlook that they entered into a contract for some 300,000 acres of land, and are about returning home to arrange for at once stocking it with from 50,000 to 60,000 head of cattle. As cattle doubled in value here within the last year, and are fully expected to advance another $10 per head this year, it is clear they have a good thing in hand.

MICHIGAN.

The Concentrating Company, says the Marquette *Mining Journal*, shipped a product of 1177 tons of concentrated ore as a result of an experimental run of its works at Negaunee—a fact which proves conclusively that the works are a success, or can, with a few changes, be made such. The works are now idle, and will remain so until spring, it being the intention to make some necessary changes and improvements during the winter.

NATIONAL.—This mine, which has recently been unwatered, shows, says the *Miner*, a good block of ground in the bottom drift, both east and west of the shaft. A large amount of work remains to be done, however, before the workings will be in shape for an active prosecution of mining operations.

TAMARACK.—The Houghton *Mining Gazette* says that the shaft has passed through the well-charged copper lode which was struck a few days ago. The deposit, as seen in the shaft, gives every indication of being highly metalliferous, and will no doubt receive exploration on its length in due time.

MONTANA.

SUMMIT VALLEY DISTRICT.

The Butte *Miner* reports as follows:

ALICE.—Development-work is prosecuted on the 700 and stoping as usual on the upper levels. A large force is working the Magna Charta, and 40 tons of ore per day are hoisted. The high-grade ore mentioned recently as being uncovered in the north drift of the 200 and 300 holds out as to quantity and grade. Work is prosecuted in the winzes from both these levels, to run down on the ore-body, and another winze has been started from the 400-foot level, to intercept the ledge.

ANACONDA.—It is expected the new works will be completed by January 1st, when active underground operations will be commenced. At present, a large amount of surface work is doing.

CLEAR GRIT.—The chute of high grade in the west 217 holds good, and hoisting from this ore-body will be started soon. A track has been laid in the 217, to facilitate handling the ore, and a stull stope is pushing through from the shaft to the face of the drift, to improve the air-current. A level has also been started on the hanging-wall side of the ledge, to open out the west drift.

COLUSA.—A full force is worked in the stopes of the 260-foot, where a large body of high-grade ore has been uncovered, some of which is shipped East for reduction, being sufficiently high grade, both in silver and copper, to make the shipments profitable.

LEXINGTON.—Sinking for a 500-foot level is vigorously prosecuted. The stopes of the 200 and 300 are producing their usual output of ore, and the mill is making a steady run.

MOULTON.—During the week, a winze has been started from the 200 at a point 200 feet east of the air-shaft, and directly under the big body of ore penetrated in sinking that shaft; a 2½-foot vein has been uncovered in the new winze, which mills 50 to 60 ounces. On the 300, in the cross-cut to the south vein, 575 feet west of the main shaft, soft ground has been struck after having run through a very hard reef of rock. The cross-cut has reached a point 75 feet south of the center vein, and it is expected the big vein which showed on the surface at that point will be penetrated any day. Progress in drifting on the 500 has been slow during the past week, the quartz being very hard and the water in the breasts troublesome.

ORIGINAL.—Sinking is to be pushed vigorously, in order to open the 300, 400, and 500 levels. The mine has heretofore been worked only to the 200-foot level.

NEVADA.

The joint Ophir-Mexican winze has passed through porphyry boulder into quartz again. The cross-cut east in the Sierra Nevada and Mexican shows no material change. The diamond drill will be started next week in the east cross-cut on the 2700 level of Sierra Nevada. Quartz carrying metal has been cut in the joint Savage-Norcross drift on the 2600 level. The fire in the Sutro Tunnel is reported to have done little damage.

NEW MEXICO.

A new mining district, known as the Hueco, has been organized about forty miles southeast of Shedd's Ranch, in the East Organs. The vein croppings assay $70 gold per ton.

MAGDALENA.—The Lake Valley *Herald* says that this company has just concluded a contract for 10,000 tons of ore from the famous Hardscrabble mine, to be delivered as quickly as possible, and that the smelter will begin active operations on the 1st of January. A contract has also been concluded for the product of the Junieta mine. One smelter of forty tons capacity is all ready for the ore, and another of equal capacity will be erected by this company at once.

SHAKSPEARE SMELTER.—A $40,000 smelter and refiner has been contracted for at Deming.

TORRENCE.—This company is said to be negotiating for neighboring property on Socorro Mountain.

VALVERDE MINING AND SMELTING COMPANY.—The following figures show the production of copper for the months mentioned:

Month.	Pounds of ore.	Pounds of matte.	Pounds blister.	No. of furnace run.
June	311,600	31,825	6,792	1
July	224,010	48,887	29,876	1
August	471,699	102,534	64,855	2
September	403,243	84,340	68,741	2
October	505,533	57,235	38,556	3
November	276,630	57,578	39,978	2

NEW YORK.

BENSON GRAVEL MINING COMPANY.—Extensive operations will be begun on this property, situated in Fulton County, shortly. Owners of gold mining prospects in the Adirondacks are awaiting with considerable anxiety the beginning of this work, as it is supposed that it will furnish an important test of the mineral value of the Adirondack region.

PENNSYLVANIA.

A large deposit of mica was recently discovered on the South Mountain, Berks County. The present lessee is said to have been offered $100,000 for his lease.

TENNESSEE.

EAST TENNESSEE VALLEY ZINC COMPANY.—This company, which organized a short time ago with a capital of $300,000, has let contracts for the erection of the furnaces and buildings in Knoxville. Several thousand tons of zinc ore are already on the dump a few miles from Knoxville. The furnaces will be in operation by next spring.

UTAH.

The Salt Lake *Tribune* says:

EMMA.—Twenty men are employed, sinking the shaft at the head of the Bay City tunnel. The new engine for hoisting, placed near the shaft, has been in operation some time, and works finely. The shaft is down 90 feet, and is to be driven 200 before cutting a station. At that depth, the vein will be cut, provided the dip remains the same; if not, it will be drifted for. Very little water has been encountered as yet. Work will go on all winter.

MAMMOTH.—Six furnaces are now running; two more are to be started shortly; and the number is to be increased to seventy-six. When the furnaces are all up, they will reduce 200 tons of ore per day, and by buying ores that can be had in plenty in the district, the company expects to combine qualities which will, with its own, make a perfect flux.

YOSEMITE.—The concentrator started up last week. It has a capacity of eighty tons a day. Its operations make available much low-grade ore in the Bingham District, which has long waited some such cheap and thorough process as this.

VERMONT.

A correspondent of the Boston *Journal* states that the amount of marble quarried, sawed, finished, and sold in 1882 by the Rutland dealers and companies was 5,000,000 two-inch feet. The average price received per two-inch foot was 40 cents, or an aggregate sum of $2,000,000 for the year's product.

PATENTS GRANTED BY THE UNITED STATES PATENT-OFFICE.

GRANTED DECEMBER 26TH.

269,525. Cable Tramway. Charles M. Huson, St. Louis, Mo.
269,563. Ore Concentrator and Amalgamator. William P. Davis, Spring City, Nev.
269,573. Rolling-Mill. Uri Haskin, Pittsburg, Pa.
269,574. Gearing for Trains of Metal Rollers. Uri Haskin, Pittsburg, Pa.
269,583. Boring-Machine. Fritz Kade, Sandusky, O.
269,599. Regulator for Compressed Gas. Julius Schülke, Berlin, Germany.
269,616. Composition for Removing Scale in Boilers. Charles R. Bacon and Frank Queen, St. James, Minn.
269,619. Rock-Drill. William J. Barber, Covington, Ind.
269,626. Union or Coupling for Pipes and Tubes. Julius L. B. Bodel and Joseph L. F. Brauer, Paris, France.
269,632. Mining Machine. Richard Bromley, Columbus, O.
269,640. Fuel. James M. Cooper, New York City.
269,645. Dry Amalgamator. Affonso de Figaniere, Philadelphia, Pa., Assignor of one half to John W. Bailey, Denver, Colo.
269,667. Ore-Pulverizer. August Heberle, Sala, Sweden.
269,676. Portable Pump. William J. Johnson, Newton, and Frank C. Johnson, Boston, Mass.; said William J. Johnson Assignor to the National Manufacturing Company, Worcester, Mass.
269,690. Boiler and Furnace. James H. Mackintosh, Paterson, N. J.
269,720. Furnace. Claus Russmann, Hamburg, Germany.
269,730. Apparatus for Compressing and Pumping Air. Elmer S. Smith, Erie, Pa., Assignor of one half to Ray V. Pierce, Buffalo, N. Y.
269,739. Mining-Auger. William N. Talley, Hampton, West Va.
269,742. Hydraulic Process of and Apparatus for Reducing and Concentrating Metallic Ores. Francis Taggart, Brooklyn, N. Y.
269,787. Machine for Rolling Rails. Uri Haskin, Pittsburg, Pa.
269,813. Gas-Engine. Lewis C. Parker, Robinson, Kan.

By the unanimous consent of the stockholders, the name of the Northwestern Reduction and Chemical Works has been changed to the Chicago Copper Company. The brand of the copper produced in its refining operations will be "Chicago Copper." The officers are Charles Ray, President; D. S. Wells, Vice-President; H. L. Norton, Treasurer; P. P. Austin, Secretary; and W. R. Roney General Manager.

FINANCIAL.

Gold and Silver Stocks.

NEW YORK, Friday Evening, Jan. 5.

There is nothing of interest to report at the Mining Exchanges. Most of the business has been monopolized by the Pipe Line certificates, and what has been done in mining shares is almost featureless. Sierra Grande has grown remarkably weak under large transactions, and fallen to its lowest price to-day. It recovered, however, and closed steady. The low-priced stocks have fallen off considerably in business, but prices have been steady. The Leadville stocks have been strong, and the Comstocks show a little improvement under small transactions. Robinson Consolidated continues to do a large business, but has been very irregular. Below will be found a summary of the market. The sales of mining shares at all the Exchanges aggregate 419,070 shares, as against 376,710 last week.

The Comstock shares have been very quiet at about steady prices. California has been quiet and steady, selling from 20@24@23c. Consolidated Virginia records a moderate business at stronger prices; it sold from 38@47c., with a business of 7900 shares. Sierra Nevada was quiet and steady, selling from $3.50@$3.75, assessment-paid shares, and from $2.25@$2.63, assessment-unpaid shares. Union Consolidated sold to the extent of 300 shares at $2.90. Mexican was quiet and strong at $2.50@$3.15. Ophir sold at $1.80 and Consolidated Imperial at 2c. Sutro Tunnel had an active business at irregular prices, selling from 17@25@20c.

The Leadville stocks were quiet at strong prices. Amie had an active business and was strong, selling from 14@20@19c. Chrysolite was also strong, under a moderate business, selling from $1.50@$1.40, with a business of 6100 shares. Hibernia sold at 1c. @2c. Iron Silver, under a moderate business, was a little weak; it sold from $2.40@$2.30. Little Chief was quiet and steady, selling from 40@38c. Little Pittsburg records transactions of 1100 shares at 65 @60c. Big Pittsburg was quiet and steady at 10@ 14@13c.

The Bodie stocks were very quiet and irregular. Bodie sold from $2.25@$2.10@$2.20, with transactions of 250 shares. Standard records only one small transaction at $6⅞. Bulwer was quiet and irregular, selling from $1.20@90c.@$1.05.

The Tuscarora stocks were quiet and strong. Grand Prize sold at 30c. Tuscarora was very quiet at 8c. Belle Isle records only moderate transactions at steady prices, selling at 56@58c. Navajo was quiet and strong, selling from $8⅛@$8¼, with a business of 1600 shares. North Belle Isle, with small transactions, sold at 40c., assessment-paid shares, and at 20c., assessment-unpaid shares. Independence was very quiet at 61c.

In the miscellaneous list, the Green Mountain stocks have been very quiet at steady prices. Gold Stripe sold at 5@4c. Green Mountain, at 41@39c. Rising Sun, at 6@7c. Cherokee, at 6c. Hall-Anderson had a fair business at strong prices; it sold from $1.25@$1.55. Horn-Silver was very quiet at $6.63@$6.38. Hukill, under a moderate business, was strong at 14@15c. Robinson Consolidated had an active business at very irregular prices; the sales aggregate 44,400 shares at $1.20@$1.40@$1.30. Sierra Grande has been the most active stock on the market, but has been very weak; it sold from $3.70 @$2.55, closing to-day at $3.

Alta-Montana declined slightly from its strong price, under a moderate business, and sold from 29@ 25c. Barcelona was very active on the American Board at irregular prices, selling from 23@28@22c. Bradshaw was quiet and a little weak, selling from 40@38c. Caledonia, B. H, had a small business, but was weak; it sold from $1.20@$1. Central Arizona was quiet and steady at 39@37c. Decatur records an active business at steady prices; it sold from 10@9c. Elko Consolidated was quiet and steady at 9c. Hortense, with a moderate business, was steady at 11@10c. Oriental & Miller had an active business at steady prices, selling at 13@12c. Silver Cliff has been a little weak, under a moderate business, selling from 38@35c. South Pacific was active and steady at 10@9c. The State Line stocks have been fairly active at steady prices; Nos. 1 and 4 sold at 3c., and Nos. 2 and 3 at 8@6c. Taylor-Plumas records a very active business at the American Board, at prices a little weak; it sold from 23@19c. Fannie Barrett is the name of a new mine on the American Board this week, and has sold to the extent of 1900 shares, at $2@$2.05.

The Excelsior Water and Mining Company has levied an assessment of one dollar and fifty cents per share, payable immediately and delinquent January 29th.

MEETINGS.

Northern Chief Mining Company, No. 2 New street, New York City. Annual meeting of stockholders and election of trustees January 10th at twelve o'clock M.

South Silver King Mining Company, Room 84, Tribune Building, No. 154 Nassau street, New York City. Annual meeting of stockholders and election of trustees, January 13th. Polls open at three P.M., and close at four P.M.

Torrence Mining Company, Room 31, No. 3 Broad street New York City. Annual meeting of stockholders and election of trustees January 10th, at twelve o'clock M.

Vandewater Gold and Silver Mining Company, Room 147, No. 115 Broadway, New York City. Annual meeting of stockholders and election of trustees, January 9th, at eleven o'clock A.M.

DIVIDENDS.

The Castle Creek Mining Company, of Idaho, has declared dividend No. 8, of three per cent, payable January 16th. Transfer-books close January 10th, and open January 17th.

The Prussian Mining and Milling Company, of Colorado, announces its regular monthly dividend (No. 10.) of ten cents per share, payable January 10th, at the office of Simpson & Son, No. 18 Wall street, New York City.

The Shoshone Mining Company, of Idaho, has declared its regular monthly dividend (No. 2) of one per

REVIEW OF THE SAN FRANCISCO MARKET.

The San Francisco market has been dull and featureless. There is no improvement in the Comstock shares. Telegraphic dispatches state that Senator Fair, when interviewed by the Stock Exchange Investigating Committee, concerning the mines, said he still had great hopes of developing more bonanzas in the lower levels. He was not surprised that stockholders were growing impatient; but stated that every thing possible was doing for their relief, and that the mines and managers' books were open to the committee for investigation. The efforts of the committee have resulted in the managers materially reducing the salaries of mining officials. The *Tribune* publishes the following dispatch:

SAN FRANCISCO, Dec. 29.—The *Post* announces, by authority, to-day, that at a recent meeting of presidents of the Comstock mining companies, under control of the Bonanza firm, measures for the alleviation of the situation were discussed, and are likely to be speedily acted upon. A plan to reduce expenses at the mines without curtailing important exploratory work is under consideration. If it is carried out, assessments in future will be smaller and levied at less frequent intervals.

Senator Sharon has not as yet carried out his threat to take the mining stocks under his control from the list. The Tuscarora stocks remain the strongest on the market, and are held for advanced prices. The Alta Mining Company has levied an assessment of twenty-five cents per share.

Copper and Silver Stocks.

Reported by C. H. Smith, 15 Congress street, Boston, Stock Broker and Member of the Boston Mining and Stock Exchanges.

BOSTON, Jan. 4.

The market the past week has been dull and inactive, as usual at the close of the year. We look for a better business in mining stocks the coming year, and shall be disappointed if, at its close, our expectations are not realized. The really good mines are sought for for investment purposes, and where good dividends are assured, it is as easy to sell them as it is railroad or other sound stock, and the record of some of our copper stocks shows that the dividends are fully as reliable. Calumet & Hecla continues to be in good demand, and maintains its position in the market, as A 1, and all the stock put on the market finds ready purchasers at $250@$252 per share. Franklin has advanced from $15@$15¼, and is wanted at this price, but very little is offering. This mine will soon take its place among the dividend-paying mines, and sell at much higher figures. Pewabic is heavy, and declined to $10 on free sales. The reports from the mines are good. The mass of copper recently uncovered proved to be very pure, yielding from 95 to 97 per cent pure copper. Quincy declined from $64½ (December 28th) to $62¾, but latter rallied to $64, buyer 60, for 25 shares. Osceola sold at $33. Huron sold at $2. Allouez sold at $2½, assessment 50c. paid. National sold at $1⅛. Brunswick Antimony at $14.

In silver stocks, Bonanza steady but dull at $2¼. Catalpa declined from 80@75c. Sullivan sold at $1. Silver Islet, $5½. San Pedro advanced from 30@47½c. Napa Quicksilver declined from $3½@$3¼.

At the Boston Mining and Stock Exchange, there has been a fair amount of business transacted, but the market is lacking in activity. The Board occupied its new quar-

ters in the parlors of the Board of Trade, at the opening of the new year, and the change, it is hoped, will be beneficial to the members in the increased facilities enjoyed for doing business. Massachusetts & New Mexico is firm at 18@19c. Empire advanced to 30c. Deer Isle declined to 10c.

3 P.M.—There was no life to the market this afternoon. Calumet & Hecla sold at $252. Catalpa sold at 77½c. Quincy declined to $63½. San Pedro sold at 47½c. Allouez, $2½ bid, $2¾ asked. Atlantic, $17 asked. Antimony, $14 bid, $15 asked. Huron, $1¼ bid, $2 asked. Osceola, $32 bid, $33 asked. Pewabic, $10¼ bid. Silver Islet, $5 bid, $6 asked.

IRON MARKET REVIEW.

NEW YORK, Friday Evening, Jan. 5.

The Eastern manufacturers of pig-iron for the open market held so protracted a meeting at the rooms of the Iron and Metal Exchange to-day that we could not obtain a report before going to press.

American Pig.—We hear that in the earlier part of the week contracts for about 4000 tons of Foundry have been closed at our quotations. It is proper to say, however, that the figures could probably now be shaded, the market being weaker and in buyers' favor. We quote at tide-water, standard to choice brands, $24.50@$26.50 for No. 1 Foundry; $22.50@$23 for No. 2; and $20.50@$21 for Gray Forge. Foreign Bessemer pig is still held at $22.50 ex ship, with no takers, and spiegeleisen is unchanged on the basis of $34@$34.50 for 20 per cent.

Scotch Pig.—With the demand slackening further, continued low freights, further quantities of arrivals going into store and forced sales, Scotch pig is declining steadily. During the week, transactions foot up to about 750 tons, in some cases even below our reduced quotations, which are, for spot; Coltness, $25.75@$26.25; Summerlee, $24.50@$24.75; Glengarnock, $22.75@$23; and Eglinton, $21@$21.25. At the Wall Street Exchange, the cables to-day are as follows, showing only a slight change in Eglinton: Carnbroe, 56s.; Gartsberrie, 64s.; Summerlee, 63s.; Coltness, 67s. 6d., Langloan 67s; Glengarnock, 55s. 6d.; and Eglinton, 50s. 9d. Warrants are unchanged at 49s.

Steel Rails.—Very little has been done. Makers feel that the low prices have secured them nearly the whole field formerly occupied by iron rails, and that they have caused a cessation of the rolling of blooms abroad for our market. They do not look for any marked changes in the near future. We quote $40 at mill.

Old Rails.—We have not heard of a single sale, and quotations remain nominally $25@$25.50 for Ts.

Scrap.—Nothing has been done. Nominally, we quote $26@$26.50 ex ship for No. 1.

Philadelphia. Jan. 5.

A more confident expression of opinion has been heard within the last two or three days among iron manufacturers and brokers than for several weeks. In some cases, the expression may be dictated by a desire for better business, but an impartial review of the situation seems to justify the expectation of an improving trade, and in some cases of improving prices. No general upward tendency has exhibited itself, and none is likely for a while; but the unfavorable tendency in prices has certainly disappeared, and if nothing better can be expected, the market will be at least steadier. A greater confidence prevails, and every body is satisfied with the present situation and the immediate future of trade. Business is not as large as is desired, but the inquiries coming to hand point to an early revival of trade, such as has been predicted for weeks past.

Pig-Iron.—In pig-iron, there has been a great deal steadier demand, which absorbs the production, especially of standard brands, as fast as produced. In a few cases, some better quotations have been named to outside buyers; but to the general trade the same quotations continue, namely, $25@$26 for No. 1. No. 2 is unchanged. Gray Forge is quoted at $19@$21 at furnace. Large buyers have been in the market within forty-eight hours, and have bought freely from parties who were anxious to sell. Concessions have been extended in a few cases, but the disposition to sell in that way is not as strong as before the holidays.

Forge Iron of good brands is easily sold at $20.50@$21 at furnace; a number of small lots sold at $19. As soon as the weaker parties have unloaded all they have, a better feeling will prevail, and asking prices will be obtained. This is the sanguine view of the situation. The other side has been represented by careful brokers to be about this: that, in view of the reduction of tariff duties and the uncertainties as to the winter and spring supply of pig, coupled with the possibility of importations, crude iron will have a declining tendency, and nothing better than current rates may be expected. Bessemer pig has been under negotiation, and some business is done. Quotations, $22.50@$23.

Manufactured Iron.—Storekeepers report a fair demand in small lots at card rates. Large buyers are ready to place contracts if lower than quoted figures are accepted. There is a good deal of business of this character in hand, which will be placed, if terms are agreed upon, before Saturday. Buyers, if their terms are accepted, will place orders, while manufacturers feel that it is not wise to load up at present inside figures, since the least amount of business is accepted at some of the low rates prevailing.

Muck Bars are quiet, and selling between $39 and $40. A few blooms sold to-day at $66. Prices are weak. Skelp iron is weak and fluctuating.

Nails are quoted all the way from $3.50@$3.60. Some large inquiries have been received within a day or two, but the offers are very low. Jobbers are willing to buy car-load lots, if their terms are accepted, as they believe that the probabilities are, under a restricted policy, that makers will be able to command better terms. A season of activity is anticipated in the spring, and they are preparing to secure stocks for a sharp demand. Structural iron is under good inquiry, and specifications have arrived for late winter delivery; but nothing definite has been closed. Angles are quiet at 2·6@2·7c.; Tees, 2½c.; Beams, 4c.; Channels, 4·2c. Tank is quoted all the way from 2½@2¾c.; Sheet and Flange at like concessions; Bridge and Boiler-Plate iron have been inquired for, and current rates have been accepted for small lots for February delivery.

Steel Rails are moving mostly in small lots. Inquiries for a few large lots have been under consideration for two or three weeks, and, when some details as to delivery can be arranged, orders will be definitely placed. Old rails are weak, and fluctuating downward. Scrap is selling at $28 for best; $26@$27 for Medium; $22.50 for Crop Ends; $19.50 for Cast.

METALS.

NEW YORK, Friday Evening, Jan. 5.

Copper.—There is nothing new to report. The copper mills have not finished their repair work,

Digitized by Google

usually done during the first weeks of the year, and are not even buying small lots to cover an occasional deficiency. Lake is nominally held at 18c., while Western is selling in a small way at 17¼c. London cables at the close £72@£72 5s. for Best Selected, and £65 10s.@£65 15s. for Chili Bars.

Preliminary estimates of a large number of Lake Superior mines, including the Calumet & Hecla, Osceola, Quincy, Conglomerate, Central, Atlantic, Allouez, Ridge, Franklin, Pewabic, Huron, and National, aggregating 54,600,000 pounds refined copper, entitle us to believe that the product for the year 1882 will range between 58 and 59 millions. Elaborate returns from the West and East indicate an additional product of at least 30 millions, so that the total output of the country will foot up to at least 88 and possibly 90 millions, of which, however, about five millions did not reach the market.

Tin.—Tin has been increasing in firmness, the bulk of the spot stock being held by strong parties. Sales during the week aggregate about 100 tons. Yesterday, cash sales of from 30 to 40 tons were made on the basis of 21⅛c.; and to day a transaction was made, 30 days, at 21¼c. We quote at the close, 21⅛@21¼c. England, which was down to £92 yesterday, reached to-day £94, spot Straits.

Lead.—The market is in a peculiar condition, but decidedly firmer. In a jobbing way, 4·75@4·80c. is asked and obtained readily for Common. In large lines, 4·65c. is freely offered, but 4.75c. is firmly held. We hear of no transactions.

Messrs. John Wahl & Co., of St. Louis, wire us to-day as folllows:

Our market is unchanged. Soft Missouri is quoted 4·30c., and Hard Lead 4·25c.

Spelter.—This metal continues to drag along. We hear occasional rumors of low figures, but can not learn that the basis of actual transactions is lower than 4⅛@4⅝c. for Domestic, which we quote.

Antimony.—Antimony is quiet and dull at 10½c. for Hallett's, and 11½c. for Cookson's.

COAL TRADE REVIEW.

NEW YORK, Friday Evening, Jan. 5.

Anthracite.

The anthracite coal trade continues quiet under the influence of unseasonable weather, which, however, now promises to turn for the better. Prices remain fairly steady, only occasional lots, which can not be looked upon as representing the market, going off at lower figures. There seems to be a growing conviction that matters will be so shaped that the prices will be maintained as they stand now, and the scarcity of some sizes, together with the fact that tide-water stocks are low, encourages this view. It is urged with some persistence, and we believe with much justice, that production should be restricted. On the other hand, it can not be denied that the dry weather in the coal regions is naturally producing that effect. We hold, however, that this is not sufficient, and are of the opinion that a short stoppage, at least, should be decided upon, if it were only to convince buyers that there is no prospect of the "break" which they are apparently waiting for.

The production of anthracite for the week ended December 30th was 453,882 tons, as compared with 608,370 tons the previous week, and 594,845 tons for the corresponding week of 1881. The total product from January 1st to December 30th was 29,316,387 tons, as against 27,991,164 tons for the like period of a st year, showing an increase this year of 1,325,223 tons.

A gentleman prominently connected with the coal trade of Philadelphia sends us the following, under date of the 4th:

The local trade has held on remarkably well for this season, but shows signs of weakness on account of the continuance of mild weather. Restriction for one or two weeks this month is now agitated, and will no doubt be shortly determined upon.

Shipments are very light. The freight to Boston remains at $2, and orders at that rate must remain scarce while charters are made at $1.25 in New York.

Until the winter sets in in earnest, if we are to have any winter, the trade here will be very quiet.

Bituminous.

The bituminous coal trade is quiet, but it must be noted that there are inquiries from parties who do not usually enter the market at this time of the year. This is particularly the case with certain Eastern railroads, which, it is stated, are buying Cumberland coal because the parties who contracted for their supply are not able to fill them as fast as desirable. The Clearfield operators are doing a little better so far as the supply of cars is concerned, and are taking less Cumberland coal than for some time past. Freights are generally easier, and prices here are a little weaker. We quote Cumberland, according to quality, $4.65@$4.85.

BULLION MARKET.

NEW YORK, Friday Evening, Jan. 5.

Under an active and enlarged demand for Eastern Exchange, the India Council has sold, at improved rates, a large amount of its bills within the past fortnight. This has checked the decline in silver, and it is inquired for at an advance of a cent an ounce. From present appearances, another advance seems probable.

DATE.	London Pence.	N. Y. Cents.	DATE.	London Pence.	N. Y. Cents.
Dec. 30....	50	108⅝	Jan. 3.....	50¼	108⅞
Jan. 1....	50⅛	Hl'day.	Jan. 4.....	50⅜	109⅛
Jan. 2....	50 3-16	108⅝	Jan. 5.....	50 7-16	109¼

BULLION PRODUCTION FOR 1882.

We give below a statement showing the latest bullion shipments. These are officially obtained from the companies, where that is possible; and where official statements can not be procured, we take the latest shipments published in those papers nearest to the mines reported. The table gives the amount shipped for the week up to the date given, as well as the aggregate shipments to such date from the first of January, 1882.

The shipments of silver bullion are valued at $1.29·29 per ounce troy; gold at the standard $20.67 per ounce troy. The actual value of the silver in the following table is therefore subject to a discount, depending on the market price of silver. If the price of silver be counted at $1.12 an ounce, which has for some months been about its average value, the following figures, where they relate to silver bullion, should be diminished by about 13½ per cent to arrive at actual value.

MINES.	States.	For the week.	Month of December.	Year from Jan. 1st, 1882.

Bullion Receipts at New York.—The bullion received from the mines at the various offices in this city during the week ended January 5th, as compiled from various sources, amounted to $496,579.80, as against $472,178.80 reported for the previous week. The receipts from January 1st, 1883, to date, are $496,579.80.

Foreign Bank Statement.—The governors of the Bank of England, at their weekly meeting, made no change in the bank's minimum rate for discount, and it remains at 5 per cent. During the week, the bank lost only £45,000 bullion; but the proportion of reserve to its liabilities was reduced from 36 1-16 to 29⅞ per cent, against 31⅝ per cent at this date in 1882. January 4th, the bank gained £6000 bullion on balance. The weekly statement of the Bank of France shows an increase of 9,575,000 francs gold and 8,500,000 francs silver.

STATISTICS OF COAL PRODUCTION.

Comparative statement of the production of anthracite coal for the week ended December 30th, and year from January 1st:

TONS OF 2240 LBS.	1882. Week.	1882. Year.	1881. Week.	1881. Year.
Wyoming Region.				
D. & H. Canal Co.	.....	3,581,973	81,443	3,581,781

Shamokin & Lykens Val.	22,618	1,238,842	.....	1,014,823
	140,362	8,286,202	156,878	7,960,066
Sullivan Region.				
St Line&Sul.RR.Co.	1,275	64,925	1,308	64,200
Total	453,882	29,316,387	594,845	27,991,164
Increase	.....	1,325,223	.....	.....
Decrease	.....	.....	.....	.....

The above table does not include the amount of coal consumed and sold at the mines, which is about six per cent of the whole production.

Total same time in 1877.....20,134,739 tons.
" " " " 1878.....17,127,681 "
" " " " 1879.....25,769,385 "
" " " " 1880.....23,096,111 "

The decrease in shipments of Cumberland Coal over the Cumberland Branch and Cumberland & Pennsylvania railroads amounts to 896,452 tons, as compared with the corresponding period in 1881.

Belvidere-Delaware Railroad Report for the week ended December 30th:

	Week.	Year. 1882.	Year. 1881.
Coal for shipment at Coal Port (Trenton)	2,843	101,786	84,399
Coal for shipment at South Amboy	10,822	832,743	777,950
Coal for distribution	18,023	778,407	732,083
Coal for company's use	3,030	133,473	115,851
Total	34,718	1,846,409	1,710,283
Increase	.....	136,126	.....
Decrease	.....	.....	.....

The Production of Bituminous Coal for the week ended December 23d was as follows:

Tons of 2000 lbs., unless otherwise designated.

	Week. Tons.	Year. Tons
Cumberland Region, Md.		
Tons of 2240 lbs	41,999	1,471,151
Barclay Region, Pa.		
Barclay RR., tons of 2240 lbs.	7,663	397,314
Broad Top Region, Pa.		
Huntingdon & Broad Top RR.	5,551	266,274
East Broad Top	2,383	91,061
Clearfield Region, Pa.		
Snow Shoe	4,363	229,276
Tyrone and Clearfield	52,756	2,743,313
Alleghany Region, Pa.		
Pennsylvania RR.	6,659	514,918
Pittsburg Region, Pa.

WE have been shown this week the first bar of Alabama tin, which, according to all appearance, is a very fair metal.

NOVA SCOTIA is now taking the lead of us in one very important matter, having made a new departure in requiring underground over-men to pass examinations before they can hold certificates. This is a course which has always been urged by those who have the best interests of the miners and of the operators at heart. No one feels as pointedly as the engineer of a mine himself the necessity of having the support of trained and reliable men as his aids. The local government of Nova Scotia has made a step in the right direction, but, we believe, should not halt there. It should establish schools in the mining districts where prospective candidates could acquire some theoretical knowledge, and where they would be afforded the means of qualifying themselves as mine-bosses or over-men.

THE annual meeting of the Philadelphia & Reading Railroad, held at Philadelphia recently, has given much encouragement to the stockholders, as the reports submitted made an exceptionally good showing; and as it is now certain that the receivership will soon terminate, the deferred income scheme turns out to have been far more successful than was generally believed. Of the entire amount of the subscription offered, ten million dollars, the sum of $7,605,491.30 has been paid in cash, of which the bulk, $6,643,505 was raised in England. Mr. FRANKLIN B. GOWEN, to whom the credit of this extraordinary financiering achievement is due, has been re-elected president. The rumors that he will resign as soon as the dissolution of the receivership is attained have been authoritatively denied.

IT has been frequently urged that civil and mining engineers, who often have charge of large bodies of men engaged in perilous work in inaccessible regions, should possess at least a limited knowledge of operative surgery. They should certainly know enough of the art to be able to tie an artery, stanch the flow of blood, or give temporary relief to those who are suffering from burns or scalds. The Society for the First Aid to Injured has been doing very good work in a general way in this direction in this city; but until now, so far as we know, though it has been agitated, no provision has been made in any of our technical colleges for this branch of instruction. We are pleased to note that the Trustees of the University of Pennsylvania, recognizing the importance of the subject, have arranged for a series of lectures before the senior classes of the technical department. We trust that the good example so set will be soon followed by other institutions.

MANUFACTURERS of copper have again entered into the usual contract for their supply of Lake, and have taken twelve millions of pounds for delivery during the next four months at the price of 18 cents. Probably this was done with the usual understanding that first hands maintain that figure during the interval, and we shall seek Lake copper lifeless and unchanged for the next four months. The fact that manufacturers were willing to pay the price named is very encouraging to the producers of Lake copper, and, to a certain extent, to makers of outside brands. It should not be forgotten, however, that the real state of the market is reflected by the quotations of Baltimore, Star, and other brands, which have not yet succeeded, however much they may desire it, to obtain the recognition for quality which Lake enjoys. The latter is considered absolutely indispensable by manufacturers of rolled metal, and, therefore, the growing quantity of Western refined metal must struggle for the remainder of the demand, and it may well happen that, for a time at least, the differences in prices between the two grades will become much greater than their relative merits will warrant. A year ago, it was half a cent per pound; now, it is nearly if not fully double that. This can not, of course, go on indefinitely, as every fraction of a decline in Western coppers will win over to them new friends, which careful refining and straightforward dealing will secure as permanent customers. We are far from taking a gloomy view of the future of copper, even considering that the Lake companies are producing 4,750,000 pounds per month, and have an assured market for the next four months for only 3,000,000 pounds. We fully appreciate the regulating influence which the handling of nearly two thirds of the entire product of the country by a harmonious body of producers exercises. On the other hand, however, we have every evidence of the growing increase in the production of other sections. The market for Western copper and the situation abroad will therefore be watched with the closest attention during the coming months. Any pressure here will be promptly relieved by shipments of matte and possibly crude copper to England, unless the market in England should take an exceptionally unfavorable turn.

WE have just received the first of the series of maps compiled by the Anthracite Survey, organized in the summer of 1881, under the direction of Mr. C. A. ASHBURNER. They are of a uniform size, 26 by 32 inches, and include a general preliminary map of the anthracite coal regions, with columnar sections through the various coal-fields, showing the identity of the beds so far as traceable, a sheet giving the well-known production diagram, and the entire set relating to the Panther Creek region of the Southern field, extending from Tamaqua to Mauch Chunk. The latter are very elaborate and complete, and serve well to illustrate the grand plan followed by the Survey. There are, first, three sheets giving the mine workings and the structure of the coal-beds in the Panther Creek basin, and the shape of the floor of the Mammoth bed where mined, and its most probable structure in undeveloped areas, by underground contour curves 50 feet vertically apart, on a scale of 800 feet to one inch. Another sheet reproduces Mr. RICHARD P. ROTHWELL'S topographical map of the Panther Creek basin, made in 1869; and a fifth shows a diagram of the surface area of the basin underlain by the Mammoth bed, and the actual area of the floor of that coal-bed developed into the horizontal plane, on a scale of twenty-four hundred feet to an inch. This sheet possesses particular interest, being, we believe, the first attempt of that kind in so exhaustive a way. The area of the bed is developed in horizontal shaded bands, each band indicating the area of the floor of the bed, contained between contour curves drawn every 200 feet vertically apart, referred to a tidal datum, due record being made of the local overturned part of the bed, and of a small acreage eroded. From tables accompanying the map, we learn that the surface area of the Panther Creek basin, underlain by the Mammoth bed, is 6844·45 acres, the total area developed horizontally being estimated at 10,858·43 acres. Corresponding figures for the Buck Mountain bed are 8028·08, and 12,767·86 acres; for the Lower Red Ash bed, 5641·15 and 8920·62; and for the upper Red Ash bed, 3949·64 and 6219·61 acres. There are a large number of sections of the basin, and of the coal-bed themselves,

Digitized by Google

and columnar sections of the coal measures, showing the relation of the beds and the character of the rock intervals in the greater number of cases. We understand that, besides the Panther Creek series now issued, there are ready for the printer a number of the sheets for the Northern coal-field, between Shickshinny and Wilkes-Barre; the Green Mountain, Black Bear, and Hazleton basins, in the Eastern Middle coal-field; and that portion of the Mahoning and Shenandoah basins of the Western Middle coal-field lying between Delano and Ashland.

Much valuable material to place on record such a mass of data was tendered to the survey by individual and corporate producers of anthracite coal, some of it available only after critical examination and careful revision. Nevertheless, as the plan is much more comprehensive than originally foreseen, the work has occupied more time, and has called for more money than the present appropriation will allow. The Anthracite Survey costs $17,500 per annum; and it is estimated that, to finish the work as now begun, it will require, inclusive of surface topographical work in some districts as yet correctly surveyed, $50,000, to be distributed over at least three years. The appropriation made in 1881 will be exhausted in November, and no funds will be available for winter work, to publish the records of the field-work of this year.

In view of the great practical importance of this excellent work, it seems almost superfluous to urge the necessity of providing for its continuance by a prompt appropriation of the sums needed to carry it to completion. The anthracite interests of the State of Pennsylvania are of such magnitude, and all that affects them so directly influences the prosperity of that great State, that we can not conceive how its claims could be overlooked or denied. We trust that we may soon be able to announce that every shadow of a doubt concerning the future of the Anthracite Survey will soon be removed. It is an enterprise broadly conceived, and diligently, intelligently, and faithfully carried out thus far. The work already done will prove the most eloquent advocate for the continuance of the survey as at present conducted.

REVIEW OF THE COAL TRADE IN 1882.

Anthracite.

The year 1881 was one of exceptional prosperity so far as volume of business in anthracite coal was concerned, and it was satisfactory too in regard to values. The impulse of that year was continued into 1882, and notwithstanding many adverse circumstances, it was so well maintained that 1882 now stands on the records of the trade as the "banner" year. The shipments have aggregated fully 29,500,000, or at least one million of tons more than last year, and the production has, therefore, been at least 31,000,000, including colliery consumption. The year has been remarkable for a number of important occurrences, which are calculated to largely extend notably the Western markets for anthracite coal. This field, upon the supreme value of which the conductors of the *Engineering and Mining Journal* and COAL have insisted for many years, is now attracting the attention of railroad managers, and the year 1882 has seen mature important projects looking to its better exploitation. The Philadelphia & Reading Railroad has, through its alliance with Vanderbilt, secured Western connections; the Delaware, Lackawanna & Western has completed its western extension; and the New York, Lake Erie & Western has made additional arrangements to obtain a larger share of Westbound anthracite tonnage. The only rival which anthracite now has in certain portions of the West is the Connellsville crushed coke, which has been gaining ground steadily, in a limited way, and which we believe is destined to play quite an important part in the future. In some sections of the country, notably in some of the Southern interior States, where coking coals are available and anthracite is too costly, crushed prepared coke may become a valuable household fuel.

On the whole, the year has been a prosperous one for the producing and carrying interests. The quantity of coal mined and handled has been heavy, and the prices obtained have been satisfactory. There has been concerted action among the leaders of the coal trade, though perhaps not as much harmony as might be desirable. While the policy pursued has turned out to be favorable to the large producers, it can not be denied that it has been hurtful to other allied interests, particularly the smaller retail dealers who have little capital.

In detail, the course of the market was as follows, from month to month:

JANUARY.—The month opened with fair weather and a hopeful feeling, which, however, a continuance of mild days dispelled. Prices became unsettled, and were falling lower and lower, when, in the middle of the month, it was decided to stop three days each week during the last two weeks of the month. This produced a better feeling, temporarily, but also led to the first signs of uneasiness among the miners. Although the production for the month was only 1,833,910 tons, the stock at tide-water increased from 497,024 tons at the beginning of the year to 586,933 tons at the close of the month.

FEBRUARY.—The trade being in an unsatisfactory condition, it was decided to work full only during the first week of the month, and restrict work to three days per week during the remainder. Although, in addition to this, production was hampered by snow-storms during a part of the month, and an improved demand, business dragged along until the close, when the market was getting into better shape. There was some irregularity during the last days, chiefly owing to the fact that no announcement as to the arrangements for curtailing in March had been made. The February tonnage was only 1,605,243 tons. The stock had declined to 546,315 tons.

MARCH.—Buyers, confident that matters would shape themselves in a manner favorable to their interests, continued to follow the policy of purchasing only from hand to mouth, even after it had been decided that work at the mines should stop nine days during the month. There was considerable agitation among the miners, and much apprehension of labor troubles, especially as strong efforts were making to rally the men under one general organization. This uneasiness was chiefly confined to the Wyoming and Lackawanna fields; but wiser counsels prevailed among the men, and they abandoned any attempt to enforce an increase of wages, while the trade was in so unsatisfactory a condition. The production during the month had been 2,101,759 tons, and stocks had grown to 666,318 tons at tide-water.

APRIL.—This month opened with the announcement of a stoppage of six days and the issuing of circulars showing a reduction in prices, which had the effect of increasing the timidity of buyers and demoralizing the market. The trade continued dull during the month, the apathy in business, and the hesitation as to the probable outcome of the crops contributing much toward that result. The stock at tide-water increased to 752,865 tons, while the production was 2,135,802 tons.

MAY.—Late in April, a restriction of six days during the beginning of the month was ordered, and yet the dullness continued unabated. There was frequent allusion to "restriction which does not restrict," and the fact that the production was 2,266,097 tons during the month, although half-time was ordered for the last two weeks of the month also, making twelve idle days in all, proves that there is some truth in such accusations. The tide-water stock was reduced to 611,441 tons, and the tonnage 2,266,097 tons. During the closing week of the month, there was more activity, it being understood that an advance in the price was contemplated.

JUNE.—This month opened with the threatened advance, which turned out to be the startling rise of ten cents average per ton. This inaugurated a policy followed for many months afterward of steadily advancing the price in the face of an unwilling market, which on an average was a month behind the published rates. It resulted in concentrating all the buying into a few days preceding the close of the month, though much of it simply took the form of an extension of contracts entered into during previous months. The growing uneasiness of labor induced the companies generally to concede a just advance in wages of ten per cent, to go into effect on the first of July. The June product was very heavy, being 2,625,039 tons; the stock on hand at the close being 588,986 tons.

JULY.—An advance of the circular was made, equivalent approximately to the increase in wages, and therefore perfectly legitimate. It had, however, been thoroughly discounted during the previous month, and trade went on very quietly. During the last weeks of the month, it was quite generally understood, through unofficial utterances, that a further advance was contemplated, but without stimulating buyers as largely as the same tactics have done before. The July tonnage was 2,757,249 tons, the stocks at the close being 575,537 tons.

AUGUST.—Although the threatened increase in the circular price was carried out, resulting in a nominal advance of from ten to fifteen cents per ton, it fell flat, and did not in reality form the basis for more than a few transactions. The business continued so dull that it was deemed advisable to take some decisive steps to make buyers realize that the companies were in earnest, and accordingly it was arranged to restrict six days toward the end of the month. Notwithstanding this action, occasional cheap lots were offered in the open market, and good buyers found little difficulty in "extending" old contracts at rates for previous months. Production was 2,894,703 tons, and stocks at the close 603,042 tons.

SEPTEMBER.—September opened with another advance, but business was quiet, and it was not till the middle of the month that August prices could be said to be ruling figures. The shipments of the mines were reported by Mr. Jones to be 2,558,443 tons, and the stocks at the close 513,934 tons.

OCTOBER.—The gradual improvement in general business, due to the assurance that the country was again blessed with an ample harvest, and a feeling of prosperity and confidence in all sections of the country, should have developed a lively inquiry. Nevertheless, the usual monthly advance fell flat, because in the past the future had been already heavily discounted, and consumers had quite generally heavy quantities of coal on hand or contracted for. Production ran up to 2,945,087 tons, while the stocks at tide-water were only 524,050 tons.

NOVEMBER.—In November, the trade was fair and started off with good hopes and in an expectant attitude, as one or two cold periods seemed to promise a severe winter. As day after day passed by, however, uniformly pleasant, the trade began to droop and prices commenced to get very decidedly "mixed." Buyers more than ever before declined to purchase except for immediate wants, looking forward to an early and general decline. Production was less heavy, shipments aggregating 2,797,372 tons, while stocks remained nearly stationary at 535,891 tons.

DECEMBER.—This month was a continuance of the preceding one so far as the attitude of the producers and consumers was concerned. In the middle of the month, the Pennsylvania Coal Company announced, alone, a reduction, earlier than anticipated. The figures quoted were very near those actually ruling, although the nominal quotations of the other companies were not changed.

The following tables will show the variations in the circular prices of the various companies during the year:

CIRCULAR PRICES OF WILKES-BARRE COAL AT PORT JOHNSTON IN 1882.

Month.	Lump.	Steamer.	Grate.	Egg.	Stove.	Chestnut.
January	$3.90	$3.90	$3.90	$4.05	$4.20	$3.90

Bituminous.

The existence of many local fields of bituminous coal throughout the country, each catering to special markets of its own, makes it impossible to speak in any thing but the most general terms of the record of coal mining throughout the country during the year just passed. The sharpest struggles in our section reflecting upon the markets tributary to it may leave others nearly untouched. Great prosperity may aid in the rapid development of one field, while another is languishing under adverse circumstances. On the whole, however, the year has been a favorable one. Production, although frequently interfered with by labor troubles, has been very large, and consumption, sometimes affected by similar mishaps, has grown wonderfully. There has been an unusual amount of railroad building, notably in the West, and much of it has directly or incidentally opened out new sources of supply. There have been very heavy investments by strong parties, especially in the Clearfield, Connellsville, and other regions in Pennsylvania, in Virginia and West Virginia, and some of the Southern States. The progress in our Rocky Mountain States has been particularly noteworthy, and the developments already made in Colorado, Montana, Wyoming, Arizona, and New Mexico give promise of a very important industry, which will reflect very favorably upon the precious and base metal mining ventures in those territories.

THE CUMBERLAND DISTRICT.—The year 1882 will be memorable in the annals of the trade of this district as the one in which the operators engaged in a prolonged conflict with the miners, and succeeded in breaking a power which threatened to destroy the supremacy of the Cumberland coal in the markets of the Eastern seaboard.

The trade moved along quietly from the beginning of the year, opening at $5@$5.25 alongside, until the middle of February, when the executive officers of the Knights of Labor of the Cumberland District issued an appeal to the miners of the Clearfield region, asking them to demand an increase of wages from 50 cents to 65 cents per ton—an appeal which did not, however, seem to meet with any favorable reception. A week later, a meeting of the Cumberland producers was held, the outcome being that it was decided unanimously to announce a reduction of wages to 50 cents for mining, to take effect on the 15th of March, and as the men declined to work at those terms, a lock-out was begun at that date. The miners began a counter-move by trying to induce the men of rival regions to strike for an advance. They succeeded temporarily in the Meyersdale region; but the effort of the Clearfield men to stop after the 15th of April fell flat. Meanwhile, the companies maintained a firm stand, notwithstanding the fact that one large contract after the other was carried off by Clearfield operators. After a long period of hesitation, due to very natural fears, the Cumberland companies decided that the only means of attaining their end was to bring in foreign labor. Arrangements to that effect were completed toward the close of May. Meanwhile, another futile effort was made to stir the Clearfield men out of their apathy, and the middle of June was reached with growing excitement in the Cumberland region over the introduction of new labor. The flagging hopes of the men were revived by a partial suspension toward the close of June by the Clearfield miners; but prompt measures on the part of their employers put an end to that effort toward the end of July, while the refusal of the Baltimore & Ohio Railroad to carry 65-cent coal from the Meyersdale region broke the back of the strike there. Meetings of the men became more numerous in the Cumberland region, and a growing feeling of weakness became manifest. The men were guilty of some excesses. The companies declined to treat with the representatives of the Knights of Labor, and to make any promises in regard to the dismissal of the new men; and seeing that their efforts were in vain, the men finally surrendered unconditionally, work being resumed in a small way on the 1st of September, after a strike of twenty-four weeks. The significance of this protracted struggle is not measured by the reduction in wages from 65 to 50 cents per ton. It was a question whether the companies or the men should be masters of the situation, and its long duration is largely due to the fact that the men were led by their leaders to believe that harmony could not prevail among the companies, and that the Clearfield miners would come to their aid. The men, having had many years of prosperity, were, as a rule, financially stronger than those in any other region. The companies have suffered a severe loss, not only through a very considerable reduction in their tonnage, but also through the transfer of nearly all the great annual contracts to the Clearfield region. Since the cessation of the strike, the fair demand for Cumberland coal, under such adverse circumstances, has proved that it has a very strong hold upon consumers. The production of the Cumberland region, in 1882, was 1,512,519 tons, against 2,231,453 tons during the previous year, showing a falling off of 718,934 tons.

CLEARFIELD REGION.—The year 1882 has been one of agitation for the producers in this district. It opened with the usual complaints of scarcity of cars and with a fair business, until the beginning of the Cumberland strike concentrated almost the entire demand of the seaboard and East for bituminous coal in the hands of the Clearfield producers. All the efforts of the men of that district to enforce an increase of wages, and thus relieve the Cumberland miners, were promptly checked by strong measures, which previous experience in such struggles had taught the Clearfield operators to use with effect. The Clearfield region, during the suspension of mining in Maryland, carried off all the contracts for the supply of Eastern railroads; but although apparently in the best of positions to command good prices, the acknowledged quotations were very low, and later developments proved that they were considerably above the actual rates in special cases. While, in the beginning of March, $4.80@$5 was the ruling alongside price in New York, it was $4.70@$4.90 in the beginning of April, it was $4.50@$4.60 in the beginning of May, $4.35@$4.50 in the first days of June, and $4.25@$4.40 a month later, with considerable shading of these figures during the entire period, some transactions being based on figures lower than $4. In July, prices were a little better, averaging $4.40, remaining fairly steady at rates a trifle lower during August. In the beginning of September, prices increased again, owing chiefly to resumption in the Cumberland field, and very low figures were again reported, with market quotations at $4.25@$4.40. A steady improvement took place in September, and in the first week of October $4.60@$4.70 was the ruling range. The extraordinary course of the market for Clearfield coal had been inexplicable to all in the trade, until in October the announcement that exceptional unauthorized freight contracts had been entered into by the officials of the Pennsylvania Railroad with some of the shippers, thus enabling them to make sales at figures which under ordinary circumstances would have been ruinous. The railroad company promptly repudiated these contracts, and declined to carry coal except for schedule rates, which practically shut Clearfield operators out of the market. After some months of negotiations, an adjustment was reached so far as the carrying of coal on old contracts was concerned, and later arrangements were perfected with some of the shippers for special rates on current business. Until the close of the year, however, Clearfield operators were largely buyers of Cumberland coal at figures ranging quite steadily between $4.60@$4.80. The output of the Clearfield region has been very heavy, aggregating 2,798,000 tons, against 2,382,621 net tons in 1881. The output of the Snow-Shoe region was 233,500 tons of bituminous coal, and 21,000 tons of coke. It was limited by the carrying capacity of the railroad. During the year, several projects have been started and are now under way to afford new and competing outlets to the region, and it is a noteworthy fact that Vanderbilt has within the last few weeks invested heavily in lands in that section.

OTHER PENNSYLVANIA FIELDS.—The great bituminous fields tributary to Pittsburg have been subject to many vicissitudes during the year, labor being a very disturbing element. The winter being open, and freshets occurring at frequent intervals, the river pits along the Monongahela sent out large quantities of coal to swell the heavy stocks at lower points, and the business continued so dull that in the beginning of April some of the largest river mines were closed. Slight rises of the river in April, and a heavy rise in the early part of May, sent additional heavy shipments forward, prices being 5½@6½c. per bushel for river lump at Pittsburg. The strike in the iron mills added to the dullness, and river pits worked along in a languid way, the season closing with lower prices at the end of June, even though the stage of the water remained favorable during a part of July. August, in a very exceptional manner, witnessed two rises; and in the middle of September, Pittsburg witnessed another unexpected and unusual coal shipment by river, followed by a second one during the last days of the month, so that the year 1882 stood unparalleled in this respect. During October and November, the river continued low, and toward the close of the latter month the fact that empty craft were all loaded led to a general suspension of mining, more than 1,200,000 tons of coal being stored in boats in the middle of December, ready to be carried out by the first rise. The close of the year was marked by the unanimous decision on the part of the river operators to reduce mining to three cents a bushel, against which the men have struck.

To the railroad operators in the Pittsburg District, the year has been one of much anxiety. Trade was dull during the first months of the year, and there was a growing conviction that the price of mining must recede, which culminated in the announcement that, after the 1st of April, 3½ cents per bushel, or 92 cents per ton, would be paid for mining, a demand that did not seem unreasonable when in rival fields, east, south, and west, from 60 to 80 cents were paid. The miners struck, and during the month hoped that the Ohio miners would come to their relief by standing out for higher prices, in which they met with disappointment. The operators, after six weeks' duration of the struggle, began to import colored miners, and their position was much strengthened by the fact that on the 1st of June all the rolling-mills of the Pittsburg District and west of that city were closed down on account of the memorable iron strike, thus greatly reducing consumption. Miners' camps were established to lessen the strain upon the resources of the union, for the maintenance of the striking men. They held out for months, until in the middle of August the men on the Pan Handle road succumbed, and the beginning of September saw all the men again at work at the reduction, after nearly five months' cessation of work.

In the Connellsville coke region, the year has been an exceedingly busy one, and property in that section has advanced with a "boom." Large tracts have passed into the hands of enterprising capitalists, and very considerable additions have been made to existing shipping facilities and to plant. A year ago, the region possessed about 9000 coke-ovens; now, a moderate estimate places the number at 11,000, not counting those in

Digitized by Google

course of construction. The Connellsville region has become the objective point of view. Railroad lines and the young industry of preparing coke for domestic purposes by crushing have made rapid progress. During the first three months, with a good demand and full production, the price ranged steadily between $1.70 and $1.80 at oven; in May it weakened, and in June had fallen off to $1.45@$1.60, declining, owing to the unfavorable outlook in the iron trade, until, with an unsettled market, it had fallen to $1.35@$1.50 at the end of July. During August, only half the capacity of the works was employed, and though a trifle steadier, the beginning of September saw prices at $1.20@$1.35 at oven. During the end of the month, with a production of 600 cars per day, the price had rallied to $1.30 @$1.50, at which figure it remained until the close of the year. The production, though restricted by a limited car supply, went up to 700 and later 750 cars per day, the capacity being estimated at 900 cars.

Trade in the coal-fields of Ohio, Illinois, Indiana, and Missouri was hampered during the year by many local disturbances, none of which, however, assumed the serious character of the strikes in Maryland and Pennsylvania. We note a steady increase in the number of mines, their facilities for shipment, and their equipment and management. Among the youngest coal-producing sections that have shown exceptional activity is Rich Hill, Missouri, which is credited with an output of 1,040,000 tons during the year 1882. There has been a very strong agitation in almost all the large cities of the West on the smoke nuisance question, and, so far as we can learn, it is likely to bear good fruit in inducing greater attention to furnace construction and preventing much waste.

In the Southern States, much effective work has been done in attracting capital to the coal and iron lands, and important projects are approaching completion or are contemplated. This is particularly true of Virginia, Alabama, and Tennessee. The Chesapeake & Ohio Railroad has completed its terminal facilities at Newport News, and the shipment of coals from that point, particularly to the East, is beginning to be a factor in the Eastern trade, where the quality of the coal is well spoken of.

The Rocky Mountain States have made wonderful strides during the past year. The northern section of Colorado, including the mines of Jefferson, Boulder, and Weld counties, is credited with an output of 550,000 tons. The Gunnison field, young as it is, has a record of 45,000 tons; the Cañon District, 150,000 tons; while the southern section, including El Moro, Trinidad, and Starkville, has produced upward of 500,000 tons and 80,000 tons of coke. Utah and Wyoming have done very well, and the mines of Montana, New Mexico, and Western Texas promise well.

"CONTROLLED COMBUSTION."

Some time since, a very wordy and enthusiastic account of some alleged inventions in the construction of fire-places appearing in one of our great daily papers, challenged attention; but little importance was attached to the subject by those familiar with matters, probably chiefly on account of the medium through which it was brought forward. The great inventions likely to revolutionize modern methods of generating steam for power, etc., have now been described in a more dignified and accessible form in the Journal of the Franklin Institute, of Philadelphia, by Mr. E. J. Mallett, Jr., the fortunate originator of the principles of "controlled combustion," as he is pleased to call it, and the inventor of the devices by which practical results are obtained by their application. In the paper referred to, Mr. Mallett goes to work systematically, although his presentation of his principles is encumbered with a good deal of verbiage. He goes into a review and study of each cause of loss of heat in the combustion of fuel, and succeeds in enumerating thirteen different causes. He seems to delight in enumeration, and we shall not quarrel with him on that point, and may merely remark that this part does not contain any thing that has not been said before, and better, by many writers on the subject. Mr. Mallett then proceeds to enumerate twelve "experimental principles," which we shall simply quote, as Mr. Mallett does not bring forward the details of any experiments upon which these principles are based, and discussion is therefore out of question:

"I. Hydrocarbon fuel tends to burn with less carbonic oxide and smoke, proportionately as its environing atmosphere diminishes in tension.

"II. Hydrocarbon fuel tends to evolve carbonic oxide and smoke, if burned in a furnace, until the temperature of the fuel reaches a certain elevation.

"III. The tension of fuel gases within a furnace is never less than that produced by the burning of the fuel itself by natural draught, and is never sufficiently low, when compared with the rate of combustion, to prevent the origination of smoke.

"IV. What was considered probable by Rankine, Peclet and others is demonstrated in 'Controlled Combustion,' namely, that air for dilution in furnace combustion would be rendered unnecessary, providing chimney draught could be dispensed with, and providing also that without such draught a supply of sufficiently heated air, in divided currents, could enter the combustion-chamber in regulable quantities.

"V. To maintain an atmosphere of the desired tension within a fire-box, an air-exhauster must supplant the chimney, and the influx of air into the ash-pit must be throttled.

"VI. When combustion is urged by a blast-fan, causing furnace air tension to be greater than normal barometric pressure, both physical and chemical actions result, differing from those created by a draught or flue-fan, incompatible with perfect combustion.

"VII. Hydrocarbon fuel, freshly charged into a furnace, must not be supplied with air to initiate its burning until the temperature of the fuel is sufficiently elevated; that is, the fuel must begin to distill before it begins to burn.

"VIII. To compel a rapid and intimate mixture of hot air with combustible fuel gases, generated within a boiler fire-box, these gases must not be allowed to ascend or envelop the boiler until after they enter the combustion-chamber through channels in close proximity to those conducting fresh heated air into the combustion-chamber.

"IX. The heat from escaping furnace gases, after leaving a steam-boiler, is more completely radiated for additional heating and boiling of water, if such gases are rendered athermous by being kept at their dew-point.

"X. It is possible, in practice, to superheat all the feed-water required by a steam-generator, from the waste heat of escaping gases, to a temperature equal to that of the water within the generator, and also to supply a portion of the feed in the form of steam.

"XI. The potential power of a steam-generator may be increased to a hitherto greater limit without diminishing the economic result.

"XII. To burn fuel rapidly, without creating a too high localized temperature, it should not be supplied with sufficient air to burn it at once to carbonic acid only, but considerable carbonic oxide should be produced, to be afterward burned in the combustion-chamber."

These "principles" look curiously like having been specially constructed to suit the exigencies of the apparatus, which aims to "control" combustion by substituting an exhaust-fan for a chimney, and taking advantage of the "low tension" of the gases when fresh fuel has been added by throttling the supply of air. Mr. Mallett heats the air for the combustion of the gases by passing it through the hollow grate-bars. He takes pains to mix air and gases well, and to provide ample combustion room. By these means, he aims to attain practically complete combustion, and it can not be denied that he has carefully considered every point that may cause loss of heat. He goes farther still, and makes an attempt to utilize as far as possible the waste heat of the gases. For this purpose, he charges them with moisture and passes them through a superheater, in which they impart a portion of their heat to water circulating in a series of coils. At what particular temperature the gases escape we have not been told. The only statements of fact that have come to our knowledge come from Mr. Clement Olhaber, Smoke Inspector, of Cincinnati, who tested boilers running on the "control combustion" system and in the ordinary way in this city. Mr. Olhaber ran three boilers with natural draught seven and a half hours with anthracite coal, and with 8142 pounds of coal evaporated 85,557·76 pounds of water from and at 212 degrees Fahrenheit, or 10·51 pounds per pound of coal, burning 13·97 pounds of coal per hour per square foot of grate. In the furnace fitted up with the Mallett apparatus, 5070 pounds of coal were used in the same time to evaporate 66,417 pounds of water, or 13·10 pounds of water per pound of coal. The rate of combustion was in this case 16·9 pounds per hour per square foot of grate surface.

THE BASIC OPEN-HEARTH STEEL PROCESS AT THE ALEXANDROWSKY WORKS, RUSSIA.

Some time since, we gave an account of the results obtained at Creusot, France, in using the basic process in the manufacture of open-hearth steel. Mr. O. T. Tellander has, in a recent issue of the *Jern Kontorets Annaler*, Sweden, given details on the work at the Alexandrowsky Steel-Works, St. Petersburg, Russia, which are particularly valuable because they give the experience gathered in producing more than 14,000 tons of ingots. The furnaces used are the same employed in the ordinary process, except that the hearth and walls are made of a mixture of dolomite and from 17 to 18 per cent of coal-tar. In rebuilding a furnace, the gas and air-flues are built up in the usual manner with Dinas brick, and upon them the bottom is rammed in form of a 7·2 inch layer of dolomite. Then wooden walls are erected parallel to the side walls of the furnace, leaving a space of 18 inches below and 12 inches above. This space is filled with the basic mixture in 2-inch layers; but in order to keep the Dinas brick and the basic mixture from running together, the joint of the two is made of a six-inch layer of a mixture of chrome ore and coal-tar. The roof is borne simply by the furnace casing. It is only touched by the side walls, and is made of Dinas brick as usual. When the furnace is finished, rail ends are laid as closely as possible over the whole of the bottom, and the rammed walls are protected by thin sheet-iron, held in place by struts of rail ends. By this means, the air is kept from the tar, so that it does not burn when the furnace is dried out, before the dolomite is well sintered. It prevents, too, swelling and foliating. The crop ends are allowed to remain in place as long as possible, until they show an inclination to weld together, when they are taken away. Firing is continued until the well sintered mass is hard, which takes 1½ days with gas, and 2½ days with wood. Charging is then commenced.

In the beginning of the work, a series of trial charges were made. Now the working appears to have settled down to the following as an average: 35 per cent of Cleveland pig (with 3 to 4 per cent of carbon, 0·70 to 2·20 per cent of silicon, 1·20 to 2·0 per cent of phosphorus, 0·06 to 0·15 per cent of sulphur), 10 per cent of cast scrap (3·50 to 4 C, 0·30 to 1 Si, 0·40 to 1·20 P, and trace to 0·05 S), 10 per cent iron rails (0·25 to 0·65 P, 0·04 to 0·20 S), miscellaneous wrought scrap (0·20 to 0·50 P), 4 per cent own scrap (0·30 to 0·45 C, trace to 0·02 Si, 0·03 to 0·10 P, 0·01 to 0·05 S, 0·4 to 0·8 Mn), 4·5 per cent of hematite pig (3 to 4 C, 0·7 to 1·2 Si, 0·03 to 0·05 P, 0·06 to 0·18 S), 6 per cent of spiegel (3·5 to 5 C, 0·03 to 0·05 P, 10 to 20 Mn), and 0·5 per cent ferro-manganese (5·5 to 6·75 C, 0·08 to 0·15 Si, 0·08 to 0·15 P, 50 to 80 Mn). In order to get cinder which would be sufficiently basic, lime to the extent of about six per cent of the total weight of the charge is added from the start. Toward the end of the charge, bricks pressed from a mixture of slacked lime and roll cinder are added, according to requirements. The phosphoric pig is first charged, followed by a layer of lime and as much scrap as the furnace will hold. This first lot generally melts in four hours, and the rest of the scrap is then put in as occasion requires, in lots of 320 kilograms. The level of the melted metal is kept pretty high, so that in the beginning, when the cinder is very fluid, a part of it will flow out of the working door when the charge is boiling. When all the scrap is melted down, and after the cinder has been drawn off as thoroughly as possible, the bath is stirred and a sample is taken, which is hammered and broken. If the fracture shows any traces of crystalline structure, 120 pounds of basic bricks, consisting of a mixture of 5 parts by volume of lime, and 4 parts of roll cinder, are added, and this is repeated until the desired quality is reached. The metal shows a tendency to rise in the molds. Repairs of the furnace after every heat, heating up and putting in the cold charge, take 2 hours 20 minutes, while the time for completing the charge is 9 hours 35 minutes, thus making it possible to make two casts during 24 hours. The basic hearth will stand from 150 to 200 charges, while the roof, walls, and flues must be repaired after from 30 to 40 heats. The time for working in a small 8-ton furnace is the same as for a large 10-ton furnace; the average product of the works is not therefore as great as it would be if all the furnaces were of the larger size. During the first five months of 1882, six furnaces, working 428 days, and making 854 charges, produced 6081 metric tons of ingots, using 1970 tons of Cleveland pig, 670 tons of cast scrap, 1409 tons of old rails, 2076 tons of miscellaneous scrap, 303 tons of hematite pig, 577 tons of spiegeleisen, and 35 tons of ferro-manganese, a total of 7040 tons. The consumption of coal was 5503 tons, and 458 tons of limestone and 120 tons of lime-cinder bricks were used besides. The yield in ingots was 86·4 per cent, and scrap 2·6 per cent, so that the waste was 11 per cent.

The following table gives the chemical composition of the various

Digitized by Google

grades of steel produced, and their physical properties, as revealed by mechanical tests:

CHEMICAL ANALYSES.

Grade.	Manganese.	Carbon.	Silicon.	Phosphorus.	Sulphur.
Rail steel	0·40 to 0·80	0·30 to 0·45	Trace	0·03 to 0·07	0·01 to 0·03
Hard "	0·30 " 0·50	0·20 " 0·25	"	0·03 " 0·05	Trace
Soft "	0·20 " 0·35	0·10 " 0·15	"	0·02 " 0·03	"
Very soft steel	0·20 " 0·30	0·06 " 0·10	"	0·02 " 0·03	"

MECHANICAL TESTS.

Grade.	Tensile strength. Lbs. per sq. in.	Elongation. Per cent.
Rail steel	71,120 to 85,344	15 to 25
Hard "	56,896 " 71,120	20 " 25
Soft "	49,784 " 56,896	25 " 30
Very soft steel	42,672 " 49,784	More than 30

The average percentage of phosphorus in the raw materials of the charge was 0·50 per cent, thus showing an elimination to the extent of 80 per cent. The most striking fact in the series of analyses is the almost perfect removal of the silicon, so that in this respect the basic open-hearth process does not differ from the basic Bessemer process.

In conclusion, Mr. Tellander gives some details on the burning of the dolomite. The Alexandrowsky works have four cupolas with a sheet-iron shell, 11·48 feet high and 5·73 feet in diameter. At first, these shells were lined with the basic material used for the hearth of the steel furnace, but it was found that this lining would not last. After some experimenting, the best was found to be a lining of chrome ore from the Ural Mountains, containing 8 per cent of silica, 13·5 per cent of oxide of iron, 13 per cent of alumina, 51 per cent of chromic oxide, 1·5 per cent of lime, and 13 per cent of magnesia. The mortar used is a mixture of two parts by volume of the smalls of the ore, and one part by volume of lime. This cupola lining lasts from 3 to 4 months as against 15 days for the dolomite lining. In burning the dolomite, the charges are 560 pounds of dolomite to from 260 to 300 pounds of coke, the yield of a cupola being 6·4 metric tons of burnt dolomite, or 51 per cent of the raw rock charged. The burnt dolomite is sorted into three grades, the first being highly burnt and dense. The third grade, in quantity about 25 per cent of the whole, is porous and light, and is used only for patching without admixture of tar.

THE LAW AS AFFECTING MINING AND METALLURGICAL INTERESTS.

Important Amendment to a Circular.—On October 31st, 1881, the Commissioner of the General Land-Office issued a circular to guide registers and receivers and surveyors-general, entitled "United States Mining Laws and Regulations thereunder." September 22d last, the commissioner amended this circular with special reference to applications for patents to placer claims, and forwarded it to the different land districts; and now the Secretary of the Interior makes an important amendment of the eighth section of the last circular, rendering it necessary, to a clear understanding of the subject matter, to publish the whole as finally amended. This circular is to be considered in connection with paragraphs 53 to 60 of regulations contained in the circular of October, 1881. The circular is as follows:

1. The first care in recognizing an application for patent upon a placer claim must be exercised in determining the exact classification of the lands. To this end, the clearest evidence of which the case is capable should be presented. If the claim be all placer ground, that fact must be stated in the application and corroborated by accompanying proofs. If of mixed placers and lodes, it should be so set out, with a description of all known lodes situated within the boundaries of the claim. A specific declaration, such as is required by Section 2333 Revised Statutes, must be furnished as to each lode intended to be claimed. All other known lodes are, by the silence of the applicant, excluded by law from all claim by him, of whatsoever nature, possessory or otherwise.

2. Section 2395, Revised Statutes (subdivision 7), requires the surveyor to "note in his field-books the true situation of all mines, salt-licks, salt-springs, and mill-seats which come to his knowledge;" also "all water-courses over which the lines he runs may pass." It further requires him to "note the quality of the lands." These descriptive notes are required by subdivision 8 to be incorporated in the plat by the surveyor-general.

3. If these duties have been performed, the surveys will furnish a reasonable guide to the district officers and to claimants in prosecuting their applications. But experience has shown that great neglect has resulted from inattention to the law in this respect, and the regular plats are of very little value in the matter. It will, therefore, be required in the future that deputy surveyors shall, at the expense of the parties, make full examination of all placer claims, and duly note the facts as specified in the law, stating the quality and composition of the soil, the kind and amount of timber and other vegetation, the locus and size of streams, and such other matters as may appear upon the surface of the claims. This examination should include the character and extent of all surface and underground workings, whether placer or lode, for mining purposes.

4. In addition to these data, which the law requires to be shown in all cases, the deputy should report with reference to the proximity of centers of trade or residence; also of well-known systems of lode deposit or of individual lodes. He should also report as to the use or adaptability of the claim for placer mining; whether water has been brought upon it in sufficient quantity to mine the same, or whether it can be procured for that purpose; and finally, what works or expenditures have been made by the claimant or his grantors for the development of the claim, and their situation and location with respect to the same as applied for.

5. This examination should be reported by the deputy under oath to the surveyor-general, and duly corroborated; and a copy of the same should be furnished with the application for patent to the claim, constituting a part thereof, and included in the oath of the applicant.

6. In case of a proposed claim for lands not yet surveyed, the foregoing regulations will govern the application for survey.

7. In controversies hereafter to be determined respecting the mineral value of lands, their value for all purposes, whether agricultural or municipal, or as seats for towns, will be considered, without reference to the decisions heretofore made in particular cases. No decision finally executed, however, will be reconsidered under this modification.

8. No application by an association of persons for patent to a placer claim will be allowed to embrace more than one hundred and sixty acres; and not less than five hundred dollars' worth of work must be shown to have been expended upon or for the benefit of each separate location embraced in such application. If an individual becomes the purchaser and possessor of several separate claims of twenty acres each or less, he may be permitted to include in his application for patent any number of such claims contiguous to each other, not exceeding in the aggregate one hundred and sixty acres; but upon or for the benefit of each original claim or location so embraced, he or his grantors must have expended the sum of five hundred dollars in improvements.

9. Applications awaiting entry, whether published or not, must be made to conform to these regulations, both with respect to amount of ground and examination as to the character of the land. Entries already made will be suspended for examination by the commissioner, and such additional proofs as may be deemed necessary in each case will be demanded.

Rights of Railroad Companies versus *Mineral Claimants.*—The following case, just disposed of in the General Land-Office, determines some new points of general interest: The local officers at Sacramento, Cal., entertained the application of Charles R. Johnson for patent for the Charter Oak placer claim, which covers the east half of southeast quarter of section 25, township 16, north range 10 east. The township plat and survey was filed September 3d, 1874, and the land was returned as mineral. The tract is within the ten-mile limit of the grant to the Central Pacific Railroad Company, the withdrawal for which became effective October 3d, 1864. The railroad company appealed from the action of the local officers in filing and entertaining the application. The case is best stated in the following review, prepared by Archibald Young and adopted by the commissioner:

"The error alleged by the appellant is, that the company was not *specially* notified of the intention of the mineral claimant to apply for patent; and it is claimed that the practice of the local officers in allowing such applications to be filed without such notice is an injustice to the company and a great hardship to its purchasers. It is further alleged that the notices of applications for patents for mineral lands are generally published in papers having only a local circulation, and that they seldom reach the company or its grantors.

"Neither the laws nor the regulations of this office require an applicant for a mineral patent to give special notice of such application to the railroad companies within the limits of whose grant the land happens to lie. By the express terms of the grant to the Central Pacific Company, all mineral lands, except such as contain coal and iron only, are excluded from its operations, and, as the tract in question was returned as mineral, the presumption is, that it is of that character, and therefore excepted from the grant. The mineral claimants, however, before they can make a legal location, must first have discovered mineral on the land, and, in order to obtain a patent, they are required to give sixty days' notice by publication in a newspaper and by posting in the local land-office and on the claim. This is considered ample notice to pre-emption settlers and all other parties having adverse claim; and I see no reason why it should not be considered and treated as sufficient notice to railroad companies, especially after the land has been returned as mineral. If the land is not mineral, the company can, at any time prior to the issuance of patent, have a hearing ordered to determine its character, upon making the proper application and depositing a sufficient sum of money to defray the expenses of the proceedings.

"Your decision" [the letter is addressed to the register and receiver] "is accordingly affirmed."

Patenting by a Part Owner.—A Colorado miner who owned four fifths of a lode claim, and desired to have the same patented, but to which the co-owner refused his consent, asked the General Land-Office how to proceed. He was advised "that there seems to exist no good reason why you may not institute proceedings for patent in the joint names of yourself and co-owner, either with or without his consent. You may be able to enforce contribution from such co-owner for his proper proportion of the expenses of patenting in the courts. You can not receive patent for an undivided interest, and this office has no authority to compel a co-owner to join in an application."

Lode Claims on Agricultural Land.—A "sharp" in Oregon is trying to get possession of a tract of land under the following facts, as he states them: Many years ago—fifteen or twenty—the land was known as placer, and was returned as mineral in 1855, by the surveyor-general. A quartz mine was also discovered; but owing to the high price of labor at the time, its working proved to be unprofitable, and the place was abandoned for mining purposes. Subsequently it was sold as agricultural. Now that labor is cheaper, the "sharp" aforesaid seeks of the General Land-Office a mineral patent for the quartz lode. He receives no encouragement from the commissioner, who will not recommend that proceedings be commenced to annul the patent.

Coal Mines on Indian Reservation.—The Jicarilla Apache Indian Reservation was set apart by executive order, September 21st, 1880. During the summer before this order, different parties developed coal mines there. The original claimants of these mines worked there until September, 1881, and then sold their interest, whatever it was, to the Amagee Coal Company. And the Commissioner of Indian Affairs wishes to know whether the company has such a title as to warrant it to continue business. The Commissioner of the General Land-Office says the company has acquired no vested rights as against the United States, although a preference right was possibly acquired over other individuals, to become operative at such time as the land should become subject to sale; but he does not think Congress contemplated, where persons make the large expenditures necessary to the development of a coal mine, virtually confiscating their property by a revocation of the license in pursuance of which such expenditures were made; and that unless there is some pending public necessity for including these lands in the reservation, he is of the opinion that the order ought to be so modified as to restore these lands to occupation, "not as a matter of absolute legal right to which the company is entitled, but because not to do so is, to some extent, a violation of the good faith in which the occupation and improvement were made."

Rights of Mineral Claimants.—The Commissioner of the General Land-Office, in a recent decision, settles a matter which has heretofore caused considerable inconvenience as well as expense to mineral claimants, many of whom have submitted to the *ipse dixit* of a local officer rather than take the trouble to appeal to the superior official. This cases comes up rom Montana, where an erroneous survey was made of a lode claim,

not marking the claims in conflict; and when a demand was made for a re-survey, the request was refused by United States Surveyor-General John S. Harris, who used the following language in reponse to the General Land-Office: "It is held by this office that the reissuing of a claim returned from the department for amendment, involving, as this case does, the same amount of office work as the original survey, requires a deposit prior to the issue of the order, equal in amount to the original deposit." The applicants were Edward Hickey and John M. Steward, and the claim is known as the Rock Island lode, entered at Helena. True, the amount of money involved was comparatively small; but there was a principle which the applicants deemed it incumbent upon them to settle at once and forever, by an appeal to the commissioner, which was duly made.

In reviewing the case in all its bearings, the commissioner says: "I am of the opinion" [addressing the surveyor-general] "that you have misunderstood . . . as to where and upon whom the fault and responsibility rest for having made and approved the survey contrary to the rules and regulations governing the survey of lode claims."

After quoting the "rules and regulations," the commissioner says: "If, in the present instance, it can be satisfactorily shown that the applicants for the official survey of the Rock Island lode had control thereof; and that, under their direction, the survey was erroneously made, then the holding made by your office will seem fair, as far as this particular case is concerned; otherwise, it will not." And the commissioner concludes as follows; "The appeal of Edward Hickey and John M. Steward from the decision of your office is hereby sustained, and you are hereby directed to have the survey of the Rock Island lode amended, ... without requiring the appellants to make any deposit, or incur any expense whatever, in correcting what has been manifestly an error committed by an employé of your office. You will require the deputy to amend the survey, and if he shall refuse to do so, report the fact to the office." The opinion in this case is exhaustive, and covers eight closely-written pages. It was prepared by Mr. A. L. Pitney, of the Mineral Division, General Land-Office.

How to Prove Title.—The following case is mainly interesting as showing what the General Land-Office considers deficiencies in title: Ernest P. Bell, claimant of the Cataba lode, Leadville, Colorado, District, was called upon through the local officers for additional proof of title. He furnished the affidavit of Julius B. Bissell, who alleges that he is the attorney for the claimant and the other parties appearing by the abstract of title to have an interest in the property. No power of attorney from these parties appears in the case, and therefore his affidavit can not be accepted as evidence in the matter, as, without such authority, the claimant Bell is in no way responsible for his (Bissell's) acts. There is also furnished what purports to be a certificate of trust, referred to in the affidavit of Bissell, which declares that Bell is a mere trustee of the Cataba Mining Company, and by which he covenants to deed the property to the company. It is not shown that this instrument was ever filed for record, or acknowledged by Bell before any officer having authority; and even if it were, it would not be accepted as sufficient ground for issuing the patent to Bell; for the Cataba Mining Company is not shown to have any title whatever to the claim. By statements in the papers, Bell virtually admits that he owns only seven twentieths of the lode. In conclusion, the commissioner says: "There seems to be no object in making application for a patent in the circuitous, uncertain, and unsatisfactory manner adopted by the claimants, as shown in Bissell's affidavit. The proper way to have a patent issued to Bell for their benefit, if such was their desire, would have been to execute a deed of trust to him, and file it for record in the recorder's office, and then to forward the abstract, including such deed, and properly attested. The better way would be to join the parties referred to in my former letter in this case in the application, and have patent issue in the names of all the co-owners." The above is but a brief of the opinion prepared by Duane E. Fox.

COLORADO COAL-FIELD.

The Denver *Republican*, in its annual review, says that the deposits of coal in Colorado are practically exhaustless, and are found in every section of the State.

THE NORTHERN BELT.

North of the divide, whence Denver largely draws its supply of fuel, coal is found in Jefferson, Boulder, and Weld counties, in which region some twenty mines are worked. Among the principal of these are the Marshall, the Fox, the Welch, the Boulder Valley, the Northrop, the Stewart, the Superior, the Mitchell, the Garfield, the Briggs, the Jackson, the Star, and others. The coal from all these mines is a free-burning, semi-bituminous, of fair quality, answering very well for heating and domestic purposes. The product of this region for the year has been about 550,000 tons, worth at the mines about $2.50 per ton. Two thirds of this production were probably consumed in Denver. Some of this coal is now shipped East as far as Omaha, where it has been to some extent displacing in the market the Rock Spring coal, which the Union Pacific mines in Wyoming. Its value is fully as good as that much vaunted coal, and now that the Burlington & Missouri has made it possible to get into the market East, a rapid development of these mines may be looked for. Arbitrary and absolutely prohibitory railroad rates have retarded development; but as a more liberal policy is hoped for from the Burlington & Missouri, the owners of these mines are more cheerful.

THE MIDDLE REGION.

The middle coal region of the State is that lying between Denver and Colorado Springs, which has so far been developed only at Franceville, where the Denver & New Orleans Company is mining. The coal is of an average quality, semi-bituminous, and though it quickly decomposes once out of the mine, it is a good domestic coal. The mine has been worked since July only, with the following result:

	Lbs.	Tons.
July	2,243,425	
August	5,432,100	
September	9,836,440	
October	9,830,236	
November	10,017,700	
December (estimated)	10,017,700	
Total	47,388,601	33,694

Coal croppings are seen at numerous points in this region, but there has been practically no development, and no estimate can be formed as to the value and extent of the belt.

THE SOUTHERN BELT.

The southern region includes Trinidad, El Moro, and that entire region, rich in fine quality of coking coal. At Starkville, five miles from Trinidad, on the Atchison, Topeka & Santa Fé Railroad, 100,000 tons of coal were produced last year. Most of this coal was sent to the South and West. The value of this coal on cars at the mine is about $2 per ton. At the same point, forty coke-ovens are running, and these have produced about 225 tons of coke, worth $4.50, which has been sent wholly into Arizona. They have not been able to fill all their orders for either coal or coke. The mines at Eagle will have shipped about 400,000 tons of coal, worth $2 on cars at the mine at El Moro, and about 12,000 tons of coke, worth at El Moro $4.50 per ton. Chappell & John's mine, south of Trinidad, has turned out 20,000 tons. The output of this region is further set forth in the figures for the Colorado Coal and Iron Company, hereto attached.

THE CAÑON REGION.

The superior qualities of the Cañon coal are too well known to require notice in this hurried review. The belt includes the valley of the Arkansas, and is mainly, if not wholly, confined to Fremont County. The region is one of the oldest in the State, and the development is large, and the exhaustless character of the deposits has been proved. The output of this region for the year has been about 160.000 tons. The value at the mines is from $2 to $2.50 per ton.

THE GUNNISON COAL.

Gunnison County is the most important coal-field in the State, and there has been considerable development. The following figures are official:

SOFT COAL.

	Tons.
Production from mines of the Colorado Coal and Iron Company, at Crested Butte, for the year ended December 31st	40,000
Skinner & Jefferson's banks, Crested Butte	500
Richardson's banks, Mount Carbon	1,500
South Park banks, Mount Carbon	1,000
Sundry local banks	500
Total	43,500

ANTHRACITE COAL.

Anthracite Mesa Coal Company, Crested Butte	1,000
M. Rush Warner & Co., Crested Butte	500
Thompson Brothers	500
Total	2,000

Coke manufactured by the Colorado Coal and Iron Company, Crested Butte, 10,000 tons. No coke is made in the county except by this company.

The soft coal of Crested Butte, as shown above, is chiefly mined by the Colorado Coal and Iron Company, and the amount of territory underlain by this coal can not be more than three thousand acres.

There are five workable seams of coal in this portion, running all the way from three feet to ten feet in thickness. They all partake of the same properties; but some of them being more or less dry, are not so well adapted for coking purposes as others. The Colorado Coal and Iron Company is at present working the six-foot seam, which is a singularly pure coking coal, almost entirely free from sulphur and slate.

The following analysis, made by H. L. Wells, chemist at the steel-works, South Pueblo, will give a clearer idea of its qualities:

Water	·72
Volatile matter	23·44
Fixed carbon	71·91
Ash	3·93
	100·00

This coal should be used entirely for the manufacture of coke. The coke made from it being very free from impurities of all kinds, with a small percentage of ash (at most, eight per cent), lustrous, hard, and with an open cellular structure is capable of bearing an immense burden in furnace; but there is great demand for the coal on account of its great heating powers for engine and locomotive use.

Skinner & Jefferson are working the four-foot seam which, being drier than the six-foot seam, makes a better domestic coal. This coal, together with that mined at Richardson's bank and the South Park bank on Mount Carbon, is fully equal to the best grade of Cañon City coal, sold by the Colorado Coal and Iron Company in Denver.

Gunnison has so far been the market for these domestic coals; but the opening up of the Denver & Rio Grande Utah line promises an extensive market at Delta, Montrose, Grand Junction, and other points for the Crested Butte soft coal, which demand is already being manifested.

The producers on Mount Carbon have been anxiously awaiting the arrival of the Denver & Southern Pacific Railroad in their neighborhood, so as to commence the shipment of coal to Denver; but the road has stopped at Gunnison, within fifteen miles of the coal-fields, and exhibits no immediate intention of pushing on.

The area of soft coal land outside of Crested Butte is very extensive, coal of more or less degree of excellence being found under hundreds of square miles throughout Gunnison County; but so far, no coking coal has been found outside of Crested Butte.

The anthracite coal is found over an extensive territory, but much of it is inaccessible and of an inferior quality. The best coal is found at the head of Anthracite Creek, near Irwin, and on Slate River, about three miles from Crested Butte. An equally good quality is also found on Rock Creek; but the immense seams found down Anthracite Creek toward the North Fork of the Gunnison River hardly come up to the Pennsylvania standard of excellence. The anthracite trade is yet in its infancy. Early in the year, Mr. H. F. Smith shipped a large quantity of it to Denver, Pueblo, Colorado Springs, and other points along the line of the Denver & Rio Grande Railroad; but owing to a want of sufficient preparation, it was not well received by the consumers; but the Anthracite Mesa Coal Company is now erecting a large breaker with all improved machinery and screens, and expects shortly to begin shipments to Denver and the East of all the various merchantable sizes of anthracite coal. When once fairly under way, it will probably be able to furnish 200 or 300 tons per day, and the demand will inevitably increase. This coal is in all respects the equal

Digitized by Google

of the Pennsylvania anthracite, chemical analysis and physical structure failing to show any material difference.

The company owned and managed by M. Rush Warner & Co. is also preparing to ship anthracite coal in merchantable shape; and as it is running from the same seams as the Anthracite Mesa Coal Company, we may expect competition and low prices for this most desirable article of domestic fuel.

The Thompson Brothers, of Irwin, have taken out considerable coal for local trade, the railroad being still eight or nine miles away from their bank; but the coal is undoubtedly the finest looking of any mined in the county; and as they are able to ship by rail, they will undoubtedly come in for their share of the trade. The property, it is understood, has lately been turned into a strong and reliable company, of which Thatcher, Geist, and Maugham, of Pueblo, are large holders as well as the original locators.

La Plata County is also very rich in excellent coal. The largest vein of coal is the Mammoth vein, near Durango, which is fifty-two feet in width. In this county, the seams are numerous and large, and for the most part so situated as to allow of cheap and expeditious mining. The character of the coal is mainly bituminous, and well adapted to coking, though some of the seams yield a steam coal of remarkably good quality. The development of these coal-beds has naturally, up to this time, been small, as the market for coal has been limited to that required for domestic purposes in Durango and vicinity; but such work as has been done has been sufficient to clearly demonstrate the extent, quality, and value of the deposits. The output in 1882 has been as follows:

	Tons.
The Florida mine	1,600
The Peacock mine	1,500
The Fairmont mine	1,300
The Graden mine	1,000
The other mines	500
Total	5,900

To this should be added the output of the railroad mine at Monero, which is in this belt, and which for the year has produced 12,000 tons, making a total of 17,900 tons for the county for the year.

OTHER POINTS.

At Como, in Park County, 75,000 tons of coal have been mined this year; but the coke produced, it has not been possible to ascertain. Walsen & Levy, at Walsenburg, have sent to the market 96,200 tons.

The following statement shows the total amount of coal produced during the year 1882:

	Tons.
The Northern region	550,000
Denver & New Orleans	23,694
Starkville	100,000
Eagle	400,000
Chappell & Johns	20,000
Fremont County	160,000
Crested Butte	43,500
La Plata	17,900
Walsen	96,200
Como	75,000
El Moro	215,449
Estimate	100,000
Total	1,821,743

Coal has been produced in other sections of the State, of which no returns could be secured, but it is believed that 100,000 tons will cover it all.

The coal output has, in other words, been nearly 2,000,000 tons, valued at about $4,000,000 at the mines.

The anthracite output has been nearly 2000 tons, value about $10 000.

The coke production has reached the sum of nearly 100,000 tons, valued at $4.50 at least, a total of at least $450,000.

Value of entire coal output, $4,460,000.

PROFESSOR JEVONS ON STRIKES AND CONSPIRACY.

Concerning the relative good and evil of strikes, Professor W. Stanley Jevons, in his recent work, *The State in Relation to Labor*, admits that on a superficial view the recurrence of strikes might be taken as an evidence of their success, since it is hardly to be supposed that workmen would venture on new strikes unless they were satisfied that advantage had been derived from previous strikes, and he does not doubt that in certain particular instances strikers have succeeded in gaining what they demanded, and even that other workmen of the same trade have profited from a corresponding rise of wages conceded in consequence from their employers. He concedes also that the wages of workmen have been greatly advanced since they acquired the right of striking at discretion. But he thinks it a mistake to argue that strikes are the cause of attainment. He points out that the rapid progress of mechanical invention has greatly increased production; that the capital of employers has grown vastly; that great changes have taken place in the purchasing power of money; and that the general rise of wages admitted to have occurred is by no means confined to trades which are united and addicted to striking, but extends, more or less, to all classes of employés. In special states of trades, particularly where there are violent oscillations of activity and depression, it is not improbable that a power of combination may temporarily secure to the laborer higher wages; but, on the whole, the author concludes that the economist incurs grave responsibility in expressing approval of any strikes.

In relation to the laws against industrial conspiracies, so-called—that is, laws imposing penalties upon persons conspiring to upset or obstruct the ordinary arrangements of trade—Professor Jevons is of opinion that it is impossible to accede to the demands sometimes made by unionists for their repeal. As he very truly says, a great city "might be reduced to starvation and anarchy by a well-devised combination of a few thousands of men," and this danger becomes more and more possible in proportion as the organization of society becomes more complex. He believes that the soundest possible solution of the labor question will be found in a system of industrial partnership under which the weekly wages would be regarded merely as subsistence money, or advances made by the employer to the laborer and his family, to tide over the interval between manufacture and sale, and the balance of the value produced would be paid at the end of the year or half-year in the form of a dividend or bonus consisting of a share of the surplus profits realized over and above the necessary expenses of production. The practicability of this system appears to be no longer open to doubt. In France, especially, it has surely and, of late, rapidly grown in favor; and several large enterprises are conducted there on the principle set forth above. The systems of arbitration and conciliation are regarded by Professor Jevons as affording no permanent settlement of the relations of employers and workmen. In his opinion, they should be considered as only forming stepping-stones to a sounder method of partnerships and participation in profits, such as that referred to above.

PRESENCE OF TELLURIUM IN COPPER.*

By T. Egleston, Ph.D., New York City.

Some months ago, samples of black oxide of copper and of pig-copper from Colorado were sent to me to examine for arsenic and antimony. I examined them both by the blow-pipe and in the wet way, but found none present. A quantity of this material was purchased by a large metallurgical works; but when they attempted to refine it, they pronounced it to be full of arsenic and antimony, so much so, that their furnaces were, as they said, "poisoned," and rendered unfit for refining. I then re-examined the samples, and at the same time some of the material which had "poisoned" the furnaces, and found no traces of arsenic or antimony when the usual amounts for analysis were used; but on taking very large amounts, I found traces merely, in some parts of the sample, but not in all. As it was a matter of interest to ascertain what the white substance that "poisoned" the furnace was, I sent to the works making the black copper, and obtained some of the matte from which the black copper was made. I took careful samples, both of it and the black copper and the refined copper. I then found the impurity to be tellurium, a substance not heretofore known as occurring in copper. I give below one analysis of the matte, two of the black and one of the refined copper:

	Matte.	Black copper.		Refined copper.
Copper	55·02	97·120	98·090	99·705
Gold	0·06	.....	.....	.....
Silver	0·40	0·132	0·128	0·135
Lead	17·87	0·777	0·757	none.
Zinc and nickel	2·22	0·070	0 100	0·024
Iron	4·18	0·130	0·080	0·031
Sulphur	20·02	0·236	†	trace.
Tellurium	0·12	0·093	0·097	0·083
Arsenic	†	0·006	†	0·091
Slag, etc	.....	1·270	0·192	.....
	99·89	99·834	99·444	100·069

The mattes and the black copper are results of the treatment of copper ores with the tellurium ores of Colorado. In the laboratory, no traces of white fumes were shown on charcoal; but when the metal in the furnace was subjected to the process of "dry roasting," as was unintentionally done, very dense white fumes were given off. When refined and cast into cake, it had the ordinary appearance of cake copper. It was then reheated for rolling in the ordinary way, showing no signs of impurity. At the first pass in the rolls, very fine cracks showed themselves, which opened in succeeding passes. At a thickness of about 0·03 meter, the cracks on each side nearly penetrated the cake, and at about 0·008 meter it began to fall to pieces. It was heated and rolled at different temperatures, but always with the same result. When cold, the metal is tough and malleable. Although the cakes in the molds showed no coating, when they were heated repeatedly and allowed to cool in the air they became covered with a white powder, which proved to be the oxide of tellurium. The copper, as it comes from the cake-molds, has every appearance of being good copper.

This is the first time, so far as I know, that the presence of tellurium has been detected in commercial copper. But very little of it is removed in the treatment, as the four analyses show. It is surprising how very small a quantity renders the copper red-short, and consequently worthless for rolling.

COMPARATIVE STEAMING VALUES OF BITUMINOUS COALS.

The following tests of the comparative evaporative values of English, Scotch, and American bituminous coals were all made in connection with the Babcock & Wilcox water-tube boilers, under the same general conditions, and all the figures worked up by the same formula, the steam in all cases being dry, but not superheated. No. 1 was Welsh coal, the test being made at the electric lighting station of the Edison Company, 57 Holburn Viaduct, London; No. 2 was Scotch coal, used at the sugar refinery of McEchran, Adam & Co., Greenock, Scotland; No. 3 was Third Pool, Pittsburg lump, used at the Mill Creek distillery, Cincinnati, Ohio; and No. 4 was Pittsburg slack, burned with forced blast at the Miami Soap and Oil-Works, Cincinnati, Ohio.

	No. 1.	No. 2.	No. 3.	No. 4.
Duration of test, hours	10·5	4	10	8
Average steam pressure, pounds	66·66	36	63·97	51·72
Average temperature of feed, degrees Fahr.	130	156	132	74
Water evaporated, pounds	34,800	14,428	112,663	51,221
Coal fired, pounds	3,360	1,344	12,000	7,365
Per cent of ash	7·50	7	4·82	12·288
Combustible, pounds	3,108	1,250	11,421	6,460
Grate surface, square feet	39·75	25	43·5	33·69
Coal consumed per square foot of grate per hour, pounds	6·261	13·44	27·5	21·861
Water evaporated per pound coal, under actual conditions, pounds	10·357	10·73	9·388	6·728
Water evaporated per pound combustible, actual conditions, pounds	11·196	11·55	9·882	7·875
Water evaporated per pound coal, from and at 212 degrees pounds	11·527	11·52	10·467	7·877
Water evaporated per pound combustible, from and at 212 degrees, pounds	12·460	12·38	10·997	8·981

The difference in the results obtained in tests No. 3 and 4 is just about the proportion that is generally found to exist between lump and slack coal from the same mine; they should be compared with each

* A paper read at the Harrisburg Meeting of the American Institute of Mining Engineers.

† No traces were found with the blow-pipe.

Digitized by Google

other in proportion to the difference in the selling price of the two grades. The extra cost of running the blower in burning slack, if properly used, is more than compensated for by the increased economy which is obtained by supplying more nearly the theoretical amount of air necessary to form complete combustion, so that this expense need not be taken into account in the comparison.

PROGRESS IN SCIENCE AND THE ARTS.

The Faure Accumulator.—Speaking before a meeting of the shareholders of the Faure Electric Accumulator Company, in London, Professor Ayrton, in the course of an address, made the following statement as to the progress made in the construction of the Faure accumulator. The Faure accumulator, as originally made, had three defects: first, that, great as was the advance it constituted on the Planté cell, still its capacity for storing electric power was not so very large; secondly, the rate at which this power could be taken out of it was limited; and lastly, some kind of flannel or felt was employed to keep the red-lead in contact with the lead plates and prevent the plates touching one another. In all these three directions the cell has been immensely improved during the last twelve months, so that whereas we thought it an excellent result to find last December that a cell weighing, with the lead, red-lead, acid, and box, about 130 pounds, contained electric energy equivalent to one horse-power for three quarters of an hour, our recent tests of the Faure-Sellon-Volckmar cells show that in a gross weight of only about 75 pounds, consisting of lead, oxide, acid, and box, there is a store of one horse-power for one hour; further, that whereas, in December last, we regarded a steady discharge without polarization of a third of an ampère per pound gross weight a good result, we now can obtain as much as three quarters of an ampère per pound gross weight. Altogether, then, the electrical value of the accumulator of the end of this year is double that of a good accumulator at the end of last.

THE E. T. Barnum Wire and Iron-Works, of Detroit, Mich., have gradually developed during the sixteen years of their existence, until now a further addition to their facilities has become necessary, and new works are building. They will be quadrangular in form, and will have more than 130,000 square feet of floor surface. They will give employment to fully 600 men when completed.

GRINDING PHOSPHATES WITH THE LUCOP & COOK PULVERIZER.—We are informed that, at the Rumford Chemical Works, a Lucop & Cook pulverizer put 3800 pounds of phosphate per hour through a 30-mesh sieve, 3000 pounds being fine enough to be bolted through a 120-mesh sieve. This, it is said, is three times the product of the mill formerly used by the works.

The Wando Phosphate Company, of Charleston, has similar favorable experience with the same pulverizer. It succeeded in passing 2100 pounds per hour through a 50-mesh sieve, the bulk of the phosphate being fine enough to pass through 100-mesh.

FATAL ACCIDENTS IN 1882.—The Pittsburg *Commercial Gazette* has evidently been keeping account of all the disasters occurring in 1882. The result is given out editorially in a recent issue of that journal, and only requires comparative statistics from former years to possess more interest, if not value. The totals are:

Tornadoes	396	Floods	163
Boiler explosions	198	Mining explosions	132
Fires	128	Struck by lightning	26
Powder explosions	83	Snow slides	81
Falling buildings	72	Dynamite explosions	11
Fireworks explosions	43	Death on the rails	820
Deaths on lake	150		

Fatal calamities by reason of railroad disasters are thus seen to be the most numerous, yet feared by the general public probably considerably less than death by lightning, by flood, or by fire.

ANALYSIS OF THE LOISEAU FUEL.—Some time since, we gave the results of a series of tests made in this city with Loiseau fuel and chestnut anthracite. Completing the record, we now give analyses of the two fuels, since made:

	Loiseau fuel. Per cent.	Chestnut anthracite. Per cent.
Carbon	82·01	73·40
Hydrogen	2·56	3·09
Moisture	2·41	0·44
Ash	10·47	17·95
Nitrogen and oxygen, by difference	2·55	5·12
Theoretical calorific power, British thermal units	13,853·00	12,339·50
Equivalent to evaporation from and at 212 degrees, pounds water	14·33	12·76

Since our *résumé* of the tests, Professor Denton, of the Stevens Institute of Technology, has revised the data, and has reached the following figures for the total or absolute calorific power of one pound of fuel, less external radiation:

	B. T. U.	Average.
Loiseau fuel, natural draught	10,430·38	10,457·29
" " forced "	10,484·21	
Chestnut anthracite, natural draught	9,590·03	9,579·67
" " forced "	9,569·32	

In these figures, Mr. Denton includes an allowance for the evaporation of the moisture in the fuels, thus favoring the Loiseau coal. It is pointed out that probably the presence of this quantity of moisture is its normal condition, and that, as it always will have this amount of work to do, it should not be credited with it. He has similarly taken into account the moisture in the air supplied for combustion. Eliminating both of these, the two fuels compare as follows: after allowing for the excessive loss of heat in the waste gases: Loiseau, 8899·45 heat-units, and anthracite coal, 7829·46 heat-units, or an advantage of 13·66 per cent. Mr. Denton, in concluding his reports, says that "the Loiseau fuel burned with such freedom and intensity and entire absence of clinker, even without a powerful forced draught, as to conclusively show its superiority to chestnut anthracite as regards ease of firing and the rapid generation of heat."

THE PITTSBURG COAL RIVER MEN.—The Pittsburg River coal men are an absolutely unique class. There are, at least, a half-dozen of them whom no combination of misfortunes can discourage, and who are always ready with some plan to surmount a new difficulty. To send a ton of coal from that city to New Orleans, 2000 miles, without the loss of a lump out of the quarter million bushels, requires and develops these traits. Who but a Pittsburg and New Orleans coal man would bore a hole in the bottom of a leaky barge to let the water out into the river again? The thing is simple when you know how. Say there are six inches of water in the barge or boat. An auger-hole is bored through the planks into the river, while the craft is in motion. Through this hole is pushed a short section of 2-inch rubber hose, until its upper end is well below the surface of the water inside and its lower end projects into the river, say a foot. The passage of the boat through the water surrounding the lower end of the hose produces a downward suction therein, drawing the water out and draining the leaky barge completely. And when a loaded barge, moored at a landing, leaks, the Pittsburger does not fret and fume and unload that coal. He gets a long pole, a nail-keg, and some dry sawdust. The second he fastens to the end of the first, after packing the keg tightly with the third. The pole and keg are poked under the barge, and a few smart taps on the outer end of the pole loosen the sawdust, which ascends and meets the leaky bottom above. It is drawn into the leaky crevices, and there it swells and stops the mischief. The same is done with damp leaves when *en route* to New Orleans, and sawdust is not available or the cracks too wide for such filling. In scores of other ways, this fertility of resource is apparent in the class of men in question.

GENERAL MINING NEWS.

ARIZONA.

From the *Star* we take the following figures, showing the product of the mines for 1882:

SILVER AND GOLD OUTPUT OF 1882.

Silver King, silver bullion	$375,000.00
Silver King, silver concentrations	440,000.00
Tip Top, silver	243,081.03
Mack Morris	281,024.00
Pioneer	33,763.00
Arizona Central, gold (estimated)	425,000.00
Silver bullion shipped from Pima per Wells, Fargo & Co.	76,109.80
Gold bullion and dust shipped from Pima per Wells, Fargo & Co	75,208.20
Silver bullion shipped from Yuma per Wells, Fargo & Co	13,369.00
Gold bullion and dust shipped from Yuma per Wells, Fargo & Co.	14,472.00
Ore-shipments via Yuma	54,106.53
Ore-shipm'ts via Casa Grande	22,500.00
Total	$2,054,133.53

Tombstone District.

Contention	$1,680,542.13
Grand Central	1,358,820.35
Stonewall (eight months' run)	240,000.00
Boston mill (custom)	165,000.00
Girard mill and mine (and custom)	177,540.00
Tombstone	1,440,894.06
Head Center (eight months' run)	$125,079.81
Watervale mill (two months' run)	15,000.00
Total of Tombstone	$5,202,876.35

COPPER OUTPUT 1882.

	Pounds.
Copper Queen, Warren Dist	8,045,320
Arizona Copper Company, Longfellow, and Coronado, Clifton Dist.	4,325,000
Old Dominion, Globe Dist	1,940,000
Buffalo, Globe Dist	461,400
Pima Company, Silver Bell Dist	961,500
Columbia, the Bulldozer and other mines, Santa Rita Dist.	498,000
Russel and Peabody, Dragoon Mountain Dist	266,686
Detroit, operating in Clifton Dist. (estimated)	250,000
Long Island, Globe Dist	453,680
Total value of copper	$2,945,284.40

RECAPITULATION.

Total of Tombstone	$5,202,876.35
Total of outside districts	2,054,133.53
Value of crude copper bullion	2,945,284.40
Estimated output not reported	1,500,000.00
Grand total	$11,702,294.28

PIMA COUNTY.

YOUNG AMERICA COPPER MINING COMPANY.—Recent official reports are, that the company has received returns from its recent shipment of ore to New York. The ore yielded 28·3 per cent of copper, for which the company received an offer of 18 cents per pound, only 4 cents per pound less than the price of Baltimore ingot copper. Dr. C. H. Lord, the superintendent, reports that the miners believe they have struck the mother vein in this property, and are very jubilant over it. A large body of ore, averaging 18·37 per cent, has been found, as well as several deposits averaging 30 to 40 per cent. Arrangements have been made for a vigorous development of the several mines belonging to the company.

TOMBSTONE DISTRICT.

TOMBSTONE.—A dispatch just received from the assistant-superintendent says that ore has been struck in cross-cut third level west side; can not tell extent as yet, but very encouraging. Also found several good leads in new ground. Furnace doing as well as possible—in fact, could not run better. The restraining order of this company against the Way Up has been continued in force by the Supreme Court until February 28d.

CALIFORNIA.

MONO COUNTY—BODIE DISTRICT.

The year 1882 has not been so prosperous a one for this district, says the Bodie *Free Press*, as some of its predecessors; still, it has not been a bad one. On an average, about 750 men have been employed in the mills and mines, which number, since the closing of the Noondays and Red Cloud works, in the first part of December, has been reduced to about 500. One hundred and thirty-five stamps out of the 139 have been constantly employed until the closing down referred to, and 95 are at the present time in motion.

The following table shows the total bullion production of the Bodie District in 1882:

Standard Consolidated	$1,258,056.80
Bodie Consolidated	484,890.48
Noonday and North Noonday	231,000.00
Bodie Tunnel	129,216.53
Syndicate	75,458.29
Boston Consolidated	1,331.00
Wagner & Gillespie's tailings mill	$8,300.00
Scattering, placer, bullion, etc.	29,527.14
Total	$2,217,780.24

The following table shows the percentage of gold and silver in 1882:

	Gold.	Silver.		Gold.	Silver.
Standard Consolidated	89·8	10·2	Bodie Tunnel	93·4	6·6
Bodie Consolidated	54·8	45·2	Tailings mill	50·0	50·0

The production for 1881 was $3,172,749.71, showing a decrease of $954,969.47.

PLUMAS COUNTY.

TAYLOR-PLUMAS.—At a meeting of the stockholders held in New York recently, the following gentlemen were elected trustees for the ensuing year: O. D. Russell, M. B. Bransford, H. L. Underwood, J. G. Moody, and John C. Marion. At a subsequent meeting of the trustees, the old officers were re-elected as follows: O. D. Russell, President; M. B. Bransford, Vice-President and Superintendent; J. G. Moody, Secretary and Treasurer.

Digitized by Google

CANADA.

NEW BRUNSWICK.

ALBERT.—At a stockholders' meeting, recently held at St. John's, the following directors were elected for the ensuing year: Henry Gilbert, John Byers, Bradford S. Gilbert, Alexander Duncan, and James S. Gilbert. Henry Gilbert was elected president, and S. Schofield, secretary.

COLORADO.

GUNNISON COUNTY.

MOFFATT SMELTER.—A dispatch to the Denver *Republican* says that the smelter, after several false starts, is now running successfully, and on January 4th turned out its first bar of bullion.

HINSDALE COUNTY.

Most of the figures given below are official, according to the Lake City *Silver World*. Those estimated will run under rather than over the actual amount. With the exception of the Ute & Ulé and Palmetto, the output is entirely from development-work—no stoping. The Palmetto represents but five months' output; and the silver product, $15,000, but about thirty days' run of the mill. The Crooke Works ran nearly the entire year upon second-class ores, and during the first four months and the last month of the year, the run was less than half-time or capacity—much of it, indeed, not one quarter, and in January and December not to exceed one tenth. The Belle of the West output is for the past two months.

PRODUCT OF SILVER.

Crooke's Works	$53,734
Palmetto Works	14,840
Total	$68,574

The production of the Ute & Ulé, Frank Hough, Palmetto, Belle of the East and West, Mountain Chief, Independence, Wyoming, Morning Star, Polar Star, and other mines, was 12,000 tons of a value of $325,000.

LAKE COUNTY.

Late Leadville exchanges contain the following:

AMIE.—About seventy-five tons of ore are shipped daily. The greater portion of the product of the mine is quite high grade in silver and lead, netting from one to two hundred dollars per ton. The shipments also include some iron ore, but no very great amount. The mine is worked on a lease.

CHRYSOLITE.—The incline driven by the management from the Colorado No. 2 shaft has attained quite a length, and is under the old workings about Vulture No. 2 shaft. A rise is to be begun in a few days, to connect the incline with these old workings and demonstrate the existence of two distinct layers of iron and ore in Fryer Hill.

HENRIETT.—The middle shaft has reached the top of the second body of mineral.

MIKE & STARR.—The shaft is sinking to a greater depth, with a view of reaching solid formation before drifting for the ore-body caught higher up last summer. The shaft is now 480 feet deep, and is beginning to show pyrites of the same character as those encountered before the ore-body was reached before.

WILLIAM WALLACE.—Work has been resumed. The pumps are working satisfactorily.

OURAY COUNTY.

BIG SAN JUAN.—The company is pushing development upon its several properties in Silver Basin, and will in a few days begin shipping ore from the Mohawk.

PUEBLO COUNTY.

COLORADO COAL AND IRON COMPANY.—The General Manager, Mr. W. G. Brown, reports the production of iron and steel for 1882 as follows:

IRON ORES.

	Tons.
South Arkansas mines	14,202
Hot Springs mines	29,190
Placer mines	8,378
Silver Cliff mines	854
Grape Creek mines	801
Total	53,425

IRON AND STEEL.

	Tons.	Pounds.
Merchant bar, mine, rail, etc	3,883 tons of	2000
Pig-iron	24,303 tons of	2000
Castings	2,752 tons of	2000
Muck bar, four months only	1,253 tons of	2240
Steel ingots, eight months only	20,919 tons of	2240
Steel blooms, eight months only	18,068 tons of	2240
Steel rails, eight months only	16,139 tons of	2240
Nails, four months only	16,158 kegs, each of	100
Spikes, six months only	5,022 kegs, each of	100

SAGUACHE COUNTY.

HORTENSE.—A recent dispatch says that a piece of tellurium taken from this mine gave assay returns of 2080 ounces in gold and 1139 ounces in silver. The shaft is down but ninety feet, and this tellurium streak is from three to four inches in thickness. This is now the third assay from this mine in the past two weeks, which gave in gold respectively 1017, 1055, and 2080 ounces, and the silver running away up in the hundreds.

PARAGON.—A large body of gray copper ore measuring eighteen inches in thickness was struck in this mine, situated on Round Mountain, which gave assays as high as 924 ounces in silver.

DAKOTA.

CALEDONIA.—The superintendent reports for the week ended December 31st Ore produced, 1050 tons. South header advanced 4 feet; total, 30 feet. North drift advanced 12 feet; total, 42 feet. No change to speak of in quality of ore. Started to sink a winze from the lower sill-floor last Thursday. The mill is crushing 150 tons every day.

FATHER DE SMET.—The superintendent reports for nine days ended January 1st: Ore extracted from first level, 1500 tons; second level, 1000 tons; third level, 500 tons. Ore milled, 3000 tons. South drift, tramway level, advanced 1 foot; 9 feet for the month; stopped. Widening third level header, 18 feet; 55 feet for month. At the end of south drift, tramway level, have struck a ledge 5 or 6 feet wide, which I will stope out 25 feet long to the surface and then work open cut.

GOLDEN SUMMIT.—The company has secured the Brady mill, and is engaged in moving it to the mine, and expects to begin the reduction of ore shortly.

GUSTIN.—The company expects to sink the west side of its properties, to reach the body of ore that is now worked by the Gustin and Minerva companies, which is said to be extensive and high grade.

HOMESTAKE.—The *Chronicle* has a report that this company intends to buy the Grand Junction mine, together with the Crofford ditch.

WASHINGTON CONSOLIDATED.—The Black Hills *Democrat* says that a patent has been taken out on this mine at Galena; and all claims on the ground have been settled. The Sitting Bull smelter, which is located on that company's land, has taken a ten years' lease.

IDAHO.

ATLANTA.—The Wood River *Times* says that the new 75 horse-power hoisting-works, which were recently started up, are running smoothly. They are of a capacity to sink 1200 feet, and are reported to have cost $15,000. A new strike was recently made on the 300-foot level of the Monarch mine, the property of this company, which promises to develop into a small bonanza. The ore is ruby silver. The extent of the body is not yet known. The two ten-stamp mills, the Greenback and Monarch, will be overhauled this winter and put in shape for a good run next summer and fall, when a large force of men will be at work extracting ore.

KETCHUM SMELTER.—The production of this smelter, the property of the Philadelphia Smelting Company, is reported by a correspondent of the Boise City *Statesman* to have been for the three months of its operation 1,575,257 pounds of lead and 165,879 ounces of silver. Of this amount, 510,165 pounds of lead and 47,298 ounces of silver were produced from ores from the company's mines.

MAINE.

DEER ISLE.—It is reported that Mr. Hanson has resigned his position as president, and that Mr. D. H. Bacon, of Portland, has been chosen to fill the vacancy.

STEWART.—The report of the superintendent shows that he has opened a vein on the property to the west of No. 2 shaft, which shows a large body of ore equal to any yet found in the district.

MICHIGAN.

The Marquette *Mining Journal* gives the following table, showing the product of the Lake Superior mines and furnaces in 1882, together with the value of the same in the market; the tables also show the product of each mine during the whole time it has been in operation, as well as the aggregate product and value of the output each and every year since 1853. It will be noticed that a goodly number of mines have been added to the shipping list, while only three or four of those reporting last year are missing. An analysis of the figures given for 1882 shows that of the total output the so-called Marquette range contributed 1,817,595 gross tons, and the so-called Menominee range 1,125,719 tons; of this last amount 276,017 tons came from the two mines in Wisconsin (Florence County) and 93,331 tons from mines located in Marquette County. Apportioned among the several counties, Marquette County would stand credited with a product of 1,886,907 tons; Menominee County, 756,371 tons; Florence (Wis.) County, 276,017 tons; and Baraga County, 24,019 tons.

Total	20,585,757	916,213	21,501,970	$164,325,895

MONTANA.

JEFFERSON COUNTY—CATARACT MINING DISTRICT.

The Butte *Miner* says that the predominating character of the ore in the district is galena, rich in silver. Several mines are expected to be worked next year and reduction-works erected by Eastern capitalists. Ore from the following five claims, the Atlantic, Butterfly, Boulder Chief, Rising Sun, and Pelgan, assayed from 53 up to 1944 ounces. The Boulder Chief, with a shaft only 16 feet in depth, has a 30-foot ledge of galena carrying strong silver. The Atlantic, with a 40-foot tunnel, has a 2½-foot ledge, with 14 inches of pay-streak, which samples 500 ounces. The Butterfly shows a fine prospect on top. The ledge is expected to be tapped by the tunnel at 65 feet, and is now in 32 feet. The Rising Sun is another good prospect. The vein has been tapped in several places along the croppings, and samples 35 ounces on

Digitized by Google

the surface. The Peigan has also been tapped in several places along the vein, the deepest prospect being only ten feet, at which depth a vein was penetrated which samples 92 ounces.

LEWIS & CLARKE COUNTY.

UNITED STATES ASSAY-OFFICE AT HELENA.—The following statement shows the value of gold and silver bullion deposited during the year 1882, as compared with 1881;

	Gold.	Silver.	Total.
1882	$678.925	$91,013	$769,938
1881	570,536	98,714	669,250
Increase			$100,688

The slight falling off in the silver deposits is owing to the increase of shipments directly from contiguous mines to the East, being a saving to the companies in the item of freights. The bulk of the silver bullion produced in the Helena District is transported to market in its crude form, and of course does not appear in the assay-office figures.

NEVADA.

ALEXANDRIA.—This company has purchased a number of claims lying south of and adjoining its property, known as the Sterling series. The work of development upon the consolidated mines of this company will be pushed ahead as fast as possible, with plenty of money to back it. The hoisting-engine lately placed upon the Alexandria incline is in course of removal to the Diligent shaft, now down to a depth of 100 feet, and which will be carried down to a depth even with the level of the Eureka Tunnel, with which connection is to be made by a drift, about 600 feet in length. This give to three mines, the Alexandria, Eldorado Consolidated, and the Eureka Tunnel, a perfect system of ventilation, cheapening and facilitating the work of development in all.

DAY.—Work is pushed ahead vigorously. The 860-foot level has been reached, a station cut out, and a drift started in the direction of the ore-chamber, and the work of sinking to the 960 level is now going on.

TUSCARORA DISTRICT.

BELLE ISLE.—The north drift on the west vein, 300 level, has been extended 24 feet the past week. The formation continues favorable for making rapid progress.

INDEPENDENCE.—The south drift on the 400 level was extended nine feet the past week and is now in 241 feet. The west cross-cut, 300 level, was extended seven feet during the same period. Shaft No. 1 has been completed to the depth of 200 feet.

NAVAJO.—A dispatch states that the developments on the 450 level add a great value to the ore-reserves, and give assurance of important developments in Belle Isle adjoining.

NEW MEXICO.

The Albuquerque *Journal* reports that ground has been broken at Copper City for two new smelters. One is building by the New Mexico & Illinois Mining Manufacturing Company, and the other is the property of a private individual.

GALLINAS MINING AND SMELTING COMPANY.—This company has completed the assessment on the Deadwood, Over the Hill, First Chance, Red Cloud, and Muldoon. With the exception of the latter, ores in paying quantities, chiefly copper and galena, have been found on these claims. Development on a substantial scale will shortly be begun.

UTAH.

CARBONET.—Contract has been let for running a tunnel, which when completed will cut the vein at a depth of 400 feet. In the veins in the upper workings, some fine ore was taken out, but it was mixed too much to pay. The tunnel is expected to cut the vein in the solid formation.

SILVER SPRING.—The manager of this company has put a force of men to work. This property adjoins the Sampson on the east. Work will be pushed vigorously to tap the ore-body.

TINTIC.—The erection of the Mammoth furnaces is pushed with the utmost vigor, and will not stop till the maximum number of twenty-six is reached. The production of matte from the furnaces in operation is constant and large.

WELLS, FARGO & CO.'S STATEMENT OF THE MINERAL PRODUCT OF UTAH FOR 1882.

Base bullion.	Lbs. lead refined.	Lbs. lead unrefined.	Ozs. silver.	Ozs. gold.
Frisco Milling and Smelting Company		3,027,424	214,320	882
Germania Lead-Works	8,213,789	561,777	85,082	169
Hanauer		5,602,324	254,339	1,384
Horn-Silver Mining Company		32,003,775	1,620,357	...
Mingo Furnace Company		10,128,738	316,309	816
Other smelters		966,000	53,566	13
Total	8,213,789	52,290,038	2,543,973	3,264
Deduct base bullion purchased by Germania Lead Company		713,385	44,968	124
Net product base bullion	8,213,789	51,576,653	2,499,005	3,140
Lead, silver and gold in ores shipped		773,197	15,464	193
Matte containing copper (605,880 lbs.)			67,320	1,683
Total (605,880 lbs.)	8,213,789	52,349,850	2,581,789	5,016
Doré Bars.				
Germania Lead-Works			303,532	646
Ontario Silver Mining Company			1,852,664	....
Silver Reef District			621,879	....
Tintic Milling and Mining Company			59,814	447
Other mills and placers			15,766	2,930
Total doré bars			2,853,655	4,023
Recapitulation.				
605,880 pounds copper, at 12½ cents per pound				$75,735
8,213,798 pounds refined lead, at 5 cents per pound				410,690
52,349,850 pounds unrefined lead, at $52 per ton				1,361,096
5,435,444 ounces silver, at $1.12½ per ounce				6,114,874
9039 ounces gold, at $20 per ounce				180,780
Total export value				$8,143,175
Value of product of 1881				7,353,658
Showing an increase this year of				$789,517

Computing the gold and silver at its mint valuation and other metals at their value at the seaboard, it would increase the value of the product to $10,312,902.

COMPARATIVE BULLION STATEMENT.

Comparative statement showing the quantity of the silver and gold contained in base bullion produced in Utah:

	Total ounces of silver produced.	Total ounces of gold produced.	Ounces of silver in base bullion.	Ounces of gold in base bullion.
1877	4,359,703	17,325	2,102,098	11,035
1878	4,357,328	15,040	2,108,339	10,165
1879	3,835,047	15,932	1,797,589	5,693
1880	3,783,566	8,020	1,403,819	2,878
1881	5,400,191	7,958	2,643,899	2,622
1882	5,435,444	9,039	2,581,789	5,016
Total	27,171,279	73,314	12,637,533	37,409

MINERAL PATENTS GRANTED BY THE UNITED STATES LAND-OFFICE.

Fifty-seven patents, as named below, will be promulgated by the General Land-Office during the week ended January 6th, showing a part of the work done in the Mineral Division, of which Mr. D. K. Sickels is chief, during the last half of December, which, it must be remembered, includes the holiday season. Under the circumstances, the showing is a very creditable one.

Coal claims of Frederick H. Saylor. Of Fayette H. Reed. Of Julius Galland. Of Charles W. Burrage.

FINANCIAL.

Gold and Silver Stocks.

NEW YORK, Friday Evening, Jan. 12.

The mining market has been more active this week than for months past, and the dealings have been more of a widespread and better character. This result is partly due to the Pipe-Line certificates, which, no doubt, have brought considerable new business to the New York Mining Exchange. Prices generally have been strong, and there is a better feeling for the future of the market. The Comstock shares come in for a small share of this buoyant feeling, but the depression in these stocks is strongly felt here. The Leadville stocks have been strong under a small business. The greatest strength shown by any of the stocks has been in the Tuscaroras. Reports from the mines are very favorable, and, consequently, the stocks have been in good demand at very strong prices. There are two or three low-priced stocks which have gained considerable strength this week, notably Elko Consolidated, Hortense, and Red Elephant. The market closed strong. Below will be found a summary. The sales of mining shares during the week at all the Exchanges aggregate 585,555, as against 419,070 last week.

The Comstock shares have been quiet at very irregular prices. California, with a large business, was strong, selling from 19@26@24c. Consolidated Virginia had quite an active business at very irregular prices; it sold from 48@56@48c., with transactions of 10,465 shares. Sierra Nevada was very quiet at $2.38@$3.60@$3.25. Union Consolidated sold to the extent of 235 shares at $3.25@$2.90. Mexican was quiet and a little weak at $3.20@$3. Ophir sold at $3, and Best & Belcher at $4. Sutro Tunnel had

quite an active business at steady prices; it sold from 20@24@23c., the transactions being 14,450 shares.

The Leadville stocks were quiet and steady. Amie has been very active at strong prices, selling from 22@18@19c. Chrysolite has been rather quiet at steady prices, selling from $1.30@$1.45. Hibernia, new stock, sold at 17c.; the old stock sold at 4@8c. Iron Silver was quiet and steady at $2.45@$2.40. Leadville was quiet and steady, selling at 65c. Little Chief had a fair business at irregular prices; it sold from 39@42@40c. Little Pittsburg was quiet and steady, selling at 65@62@64c. Climax had a business of 800 shares, and sold from 10@8c. Big Pittsburg records a moderate business at strong prices, selling from 15@23@22c.

The Bodie stocks were quiet at about steady prices. Bodie was very quiet, selling at $2@$1.90. Standard with a small business, was steady at $6@$6.50. Bulwer sold at $1@95c., with a business of 600 shares. Bechtel sold at 20@25c.; Goodshaw, at 6@7c.; and Tioga, at 5c.

The Tuscarora stocks had a fair business at strong prices. Grand Prize was quiet and very irregular, selling from 32@50@33c. Tuscarora was quite active and very strong, selling from 10@20@15c., with a business of 13,900 shares. Navajo had a moderate business, but was very strong; it sold from $8.75@$9.50@$9.25. Belle Isle was also very strong, under a fair business, selling from 75c.@$1.60@$1.20. North Belle Isle was active and strong, selling from 45@80@75c. Independence was quiet and weak; it sold from 80@65@66c.

In the miscellaneous list, the Green Mountain stocks were active at strong prices. Gold Stripe was very active, selling from 6@8c. Green Mountain was strong at 40@46c. Rising Sun was strong at 6@11c.; and Cherokee sold at 7@10c. Great Eastern had a fair business at steady prices, selling from 2@4c. Hall-Anderson was quiet and strong, selling from $1.60@$1.75. Horn-Silver, under a moderate business, has been strong, selling from $6.25@$7@$6.50. Hukill has been quiet, but has developed considerable strength; it sold from 14@29@27c. Robinson Consolidated has been quite active at irregular prices; it sold from $1.20@$1.30@$1.25. Sierra Grande has also been quite active, and at one time was very weak, but has regained some of its strength; it sold from $2@$3.10; closing at the latter figure to-day.

Alta-Montana suffered a decline to-day to 22c. It has had a moderate business during the week at 26@24@27c. Barcelona continues to be very active on the American Board at steady prices; it sold at 21@25c. Bradshaw has been moderatively active at steady prices; it sold from 36@39@38c. Central Arizona developed some strength to-day, selling as high as 55c. It sold during the week at 37c. Decatur has been very active at steady prices, selling at 10@9c. Elko Consolidated records a very active business at very strong prices; it sold from 9@24@19. Hortense under a fair business, has been strong, selling from 14@20@17c. Oriental & Miller has been active and steady at 12@13c. Rappahannock has been active and strong, selling from 9@13@11c. Red Elephant has had a very active business, and has developed considerable strength; it sold from 5@11@10c. Silver Cliff has been quiet and irregular at 38@41@39c. South Pacific records a large business at steady prices, selling from 10@9c. The State Line stocks have had a fair business at steady prices. Nos. 1 and 4 sold from 2@4c., and Nos. 2 and 3 from 7@8c. Taylor-Plumas has been very active at steady prices, selling from 19@22c.

PIPE LINE CERTIFICATES.

The business in the Pipe Line Certificates at the New York Mining Exchange has been very large this week, and is constantly growing. The Board is now connected with the Oil City Exchange by special wire, and quotations are received directly from there and in advance of those sent out on the tape. In addition to this, the system of clearing adopted by the Board affords special advantages to those wishing to trade in oil. Below will be found the daily quotations and sales for the past week. The highest quotation for the week was 93½c. and the lowest 84⅛c.

	Opening.	Highest.	Lowest.	Closing.	Sales.
Jan. 6....	86¾	89¾	86	88¼	79,000
" 8....	87¾	89½	84⅛	87¾	256,000
" 9 ..	89	90⅝	88¾	89¼	175,000
" 10....	89¼	93½	86	90	250,700

Silver Queen Mining Company, No. 52 Broadway, Room 57. Annual meeting of Stockholders, January 23d, at two P.M.

REVIEW OF THE SAN FRANCISCO MARKET.

The San Francisco market continues dull. The market for the Comstocks is flat, and there is no news of importance from the mines. The Tuscarora stocks have been the attraction in the market at very strong prices, Navajo taking the lead. Telegraphic dispatches from this mine state that developments on the 450 level add $1,000,000 value to the ore-reserves, and give assurance of important developments in Belle Isle adjoining. The Mining Boards, at their annual meeting, re-elected the old officers. It is said that in consequence of the decline in the mining stock business, the Pacific Exchange has decided to dispose of its property on Montgomery street. Scorpion has levied an assessment of ten cents per share.

The following statement shows the financial condition of the companies named on January 1st:

	Cr.	Dr.
Consolidated Virginia	$104,000.00	
Chollar	29,278.06	
Gould & Curry	17,642.40	
Hale & Norcross	19,479.19

Copper and Silver Stocks.

Reported by C. H. Smith, 15 Congress street, Boston, Stock Broker and Member of the Boston Mining and Stock Exchanges.

BOSTON, Jan. 11.

The market for mining stocks the past week has not shown that degree of activity which we hoped would result from the opening of the new year; still there are signs of encouragement that more activity and better prices for the really good mines is not far in the future. The Lake Superior copper stocks are held very firmly, and higher prices are confidently predicted for those who make regular returns to their stockholders. The speculative list is almost wholly neglected, the public not being in the mood for fliers as yet; before the year closes, however, this may be changed, as has been the case in years past, when almost every body was ready to make a quick turn in copper stocks, which may be called a Boston notion. Among the coppers, Calumet & Hecla is firm and in good demand at $252@$253; the usual quarterly dividend of $5 has been declined. Franklin is strong, and although a lot of 500 shares was on the market, it was quickly absorbed at $15½, and later 300 shares were taken at $15¾, with none offered now at less than $16. Pewabic advanced from $10@$10¾, but receded again to $10, which was the bidding price to-day. Quincy has ruled steady at $63@$63½, with sales at $64, buyer 60 days. Osceola sold as before at $33; Atlantic at $17; Huron at $2; and National at $1⅞.

In silver stocks, Bonanza was very dull at $2¼@$2⅜. Catalpa declined to 75c. Crescent sold at 30c. Harshaw at 50c. San Pedro declined to 35c.; and Sullivan to $⅞. Silver Islet advanced from $5¼@$7½ on sale of 100 shares only. Napa Quicksilver sold at $3⅛.

At the Boston Mining Exchange, there has been a fair amount of business transacted, and prices in some instances show an advance over ruling quotations of last week. Empire advanced from 30@34c. Massachusetts & New Mexico, from 18@20c. Deer Isle from 10@20c., but later fell off

again to 13c St. James Manganese advanced to $1.15, but we should not advise buying it at any such price. Twin Lead declined to 23c. Pipe line certificates have been dealt in somewhat at New York prices.

3 P.M.—At the afternoon Boards, but little was doing, dullness being the prevailing characteristic. Calumet & Hecla sold at $252; Quincy, at $63½; Catalpa, 75c.; San Pedro, 40c.; Napa, $3¼. Closing prices: Allouez, $2½@$3; Atlantic, $15@$17; Antimony, $14 bid; Bonanza, $2⅛; Franklin, $15¼@$15¾; Huron, $1⅞@$2; National, $1½@$2; Osceola, $32@$33; Pewabic, $10@$10¼; Quincy, $63@$63½; Silver Islet, $5@$6⅛; Sullivan, $¾@$1; Napa, $3⅛@$3¼.

IRON MARKET REVIEW.

NEW YORK, Friday Evening, Jan. 12.

The following figures for the imports of iron and steel into the port of New York for the years 1881 and 1882 will be perused with interest:

Imports.	1881.		1882.	
Pig-iron	184,689	tons.	282,498	tons.
Spiegeleisen	87,926	"	65,950	"
Old rails	34,468	"	39,516	"
Iron rails	27,629	"	9,392	"
Scrap iron	21,429	"	38,918	"
Scrap steel	28,087	"	15,917	"
Iron ore	218,673	"	148,332	"
Swedish iron	....		23,970	"
Iron wire rods	....		11,020	"
Steel " "	....		79,653	"
Hoop-iron	....		3,392	"
Sheet-iron	....		6,843	"
Russia sheet	1,249	tons.	1,392	"
Iron beams and channels	....		5,519	"
Iron bars and bundles	....		5,464	"
Iron cotton ties	....		51,710	"
Steel tires and forgings	....		3,053	"
Steel bars, etc	....		8,097	"
Steel rails	55,029	tons.	59,757	"

American Pig.—The market continues unsettled and weak so far as less well-known brands are concerned. The makers of standard brands still maintain a firm position, due principally to the fact that they have small stocks only. There is evidence that stocks are accumulating a little on the hands of producers, and weaker concerns are, therefore, found to press sales somewhat by offering at concessions. We have no business of any magnitude to report, and quote as follows, with the market in favor of buyers' interest: We quote at tide-water, standard to choice brands, $24.50@$26 for No. 1 Foundry; $22.50@23 for No. 2; and $20.50@$21 for Gray Forge. Bessemer pig is quiet and dull at $22@$22.25, the latter figures being the lowest mentioned by sellers. Spiegeleisen is dull and quiet, with 10@12 per cent. at $27.50@$28, and 20 per cent at $33@$34.

Scotch Pig.—The situation has not changed, except that the market is a trifle weaker. Arrivals are not heavy, and partially go into store. The foreign market is showing a small decline, and freights are still cabled low, 5s. from Glasgow. During the week, sales have aggregated about 1000 tons at private terms. Desirable buyers could probably obtain concessions from the following quotations: Coltness, $25.50@$26; Summerlee, $23.50; Glengarnock, $22.75@$23; and Eglinton, $21@$21.50. At the Wall Street Exchange, the cables to-day are: Carnbroe, 55s. 6d.; Gartsherrie, 63s. 6d.; Summerlee, 62s. 6d.; Coltness, 67s.; Langloan, 67s.; Glengarnock, 55s.; and Eglinton, 50s. 6d. Warrants are 48s. 2d., a decline of 10d.

Steel Rails.—Some of the mills are not taking orders for earlier than July delivery. There have been sales of small lots at $40 at mill, which is firmly adhered to, and which we quote. England is lower, £4 17s. 6d.@£5 2s. 6d.

Old Rails.—The market is dull and weaker. We hear that American Ts are offered at $23. Nothing has been done in Double Heads.

Scrap.—We hear of no transactions; $27@$28 is asked ex yard.

Philadelphia. Jan. 12.

The only unsettling influence in the Pennsylvania iron trade, and which holds in check a rising demand for iron, is the pending reduction in the tariff duties on iron and steel. Consumers are keeping stocks low, intending to buy largely when bottom is reached; but this very necessity will tend to react on prices, and the probability is discounted by a few careful sellers and buyers. The general situation is good. Large quantities of iron will be wanted. The railroad companies are still holding back, and will not come into market while matters are so unsettled. Railroad work is vigorously prosecuted in nearly all parts of the country, and surveys are running for a thousand miles or more of road. The present lull is more from the exercise of prudence than through lack of demand.

Pig-Iron is barely holding its own. The standard brands are firm, while the inferior makes are going for the best prices to be had. Foundry, in fifty-ton lots, has sold at $24.75@$25@$25.50; No. 2, $23. Gray Forge iron sold at $20.50. Inquiry is less active. Both sides are waiting for developments.

Bessemer Pig.—Very little has been done. Buyers offer under rates. Quotations are: $22@$22.50, tide-water. Negotiations are hanging fire. Foreign Bessemer is weak. Offers for future shipments, large lots, are under consideration.

Muck Bars.—Prices have weakened $1 per ton, and business has been done at $38; offers are in hand at $37.

Blooms.—Charcoal Blooms are weak. Actual selling prices are below quoted rates—$65@$67; Anthracite, $55@$56. New business is scarce.

Merchant Bar.—Small lots are selling at and above 2·40c. rates at store. Mill prices gravitate between 2·30@2·40c., common iron a little less. Consumers want iron, but are holding off, and possibly may wait too long. Should all who are waiting conclude to present their requirements at once, in February or March, as circumstances might seem to require, there would be an improvement in spite of the apparent weakness. Mills have small stocks on hand, and consumers are running from hand to mouth.

Nails.—Factories have quoted this week $3.30@$3.40, in response to inquiries. Should the combination stick together, firmer prices will be had in the spring.

Shapes.—To-day's quotations are: Angles, 2·5c.; Tees, 3½c.; Beams and Channels, 4@4·2c.; but desirable orders can be had under these quotations, though manufacturers are not short of work. Plates are quoted 2½@2·6c., all mill figures.

Plate and Tank.—Very little fresh business has come along, and buyers are living in hopes that they can place large orders at lower than current rates. Tank, 2·50@2·60c.; Shell, 3·50c.; Flange, 4·50c.

Steel.—Steel for tools, machine-shops, etc., is in moderate request. Prices have weakened during the past thirty days, and orders have been accepted at 10 per cent off card rates.

Steel Rails.—Several inquiries are in hand, and a moderate amount of business has been done in large and small lots at $39@$41 quoted.

Old Rails.—Sales of small lots have been made at $26; offers are made for shipment at $25 tide.

Scrap.—$26@$28 covers the few transactions that have been heard of.

METALS.

NEW YORK, Friday Evening, Jan. 12.

Copper.—During the week, it transpired that the lake companies had contracted to deliver between 10 and 11 millions of pounds of copper, to manufacturers chiefly, at 18c. We have had this news confirmed by the best of authority. The market is firmer for Lake, and a number of small parcels have changed hands at 18c. each, with some holders at the close ask-18⅛c. We record also sales of several hundred thousand pounds of Baltimore at private terms. Baltimore is now held at 17@17⅛c. London cables at the close £66 15s.@£67 for Chili Bars, a slight increase, and £72@£72 5s., for Best Selected, unchanged.

Tin.—The market has been fairly active, with the prices tolerably well maintained at the closing figures of last week, 21¼@21⅝c. asked for spot Straits, and 21¼c. freely paid. London, which went as high as £94 15s. during the week, had reacted £90 5s. at the close. The imports of tin into New York were 10,640 tons in 1882, against 9758 in 1881.

Lead.—The market has been more active here, and we note sales of 400 tons Refined at 4·75c., and 200 tons Pueblo refused at 4·70c., with additional transactions closed in the West. The bulk of these sales, both East and West, appears to be for future delivery, consumers, it seems, being desirous to secure a part of their supplies in any emergency. We quote: Common, 4·70c.; and Refined, 4·75c. London cables £13 15s.@£14 for English Common.

White lead manufacturers from all parts of the country have held a three days' meeting in this city, with a view to agreeing to some arrangement to place prices on a remunerative basis. The attendance was full and the feeling in favor of an agreement which will probably be entered upon, should the absentees be induced to give it their support. It does not seem that this is to be combined with any effort to restrict production, and it may possibly, therefore, lead to a general crowding of the beds and a temporary increase of the demand from that quarter.

It is understood that the stock of 7000 or 8000 tons of the Richmond Company is held at 4·90c., and that the largest holder in Chicago insists on 4·70c.

Preliminary estimates of the production of lead in the United States, compiled from the returns obtained from all the important desilverizing establishments in the country, and after a careful estimate of Missouri and Illinois, enable us to s ate that the output was at least 136,000 net tons during the year. A few outstanding returns may possibly increase this figure to 139,000 tons. The smaller figure is a minimum.

From St. Louis, Messrs. John Wahl & Co. wire us to-day as follows:

Our market has shown remarkable activity since our last advices. Sales for the week sum up over 400 tons of Refined at 4·30c., and 300 tons of Hard Lead at 4·25c.

Spelter.—There is nothing new, and the market remains dull and lifeless. We quote 4·50@4·65c. for Common. England cables £16 5s.@£16 10s. for Ordinary. It may be of interest to note that the imports into the port of New York during 1882 were 11,176 tons, against 2636 tons in 1881.

Antimony.—The market is weak, and it is stated that Cookson's is now selling at less than the cost of importation. We quote Cookson's 11¼@11⅝c., and Hallett's, which is scarce, at 10⅝c.

Quicksilver.—Spot market quiet at 35½c.; some holders ask 36⅜c., preferring to ship upon owners' account rather than to sell at this low rate.—*San Francisco Commercial Herald.*

BULLION MARKET.

NEW YORK, Friday Evening, Jan. 12.

But for an advance here in sterling exchange, the past week, silver would show a considerable decline since our last issue. The London rate to-day is about as low as it has marked on the recent decline.

DATE.	London	N. Y.	DATE.	London	N. Y.
	Pence.	Cents.		Pence.	Cents.
Jan. 6 ...	50 7-16	109¼	Jan. 10.....	50⅜	109⅛
Jan. 8....	50⅜	109⅛	Jan. 11.....	50¼	109
Jan. 9. ..	50⅜	109⅛	Jan. 12.....	50⅛	108⅞

Foreign Bank Statement.—The governors of the Bank of England, at their weekly meeting, made no change in the bank's minimum rate for discount, and it remains at 3 per cent. During the week, the bank gained £264,000 bullion, and the proportion of its reserve to its liabilities made an extraordinary gain—from 29⅞ to 37 11-16 per cent, against 34⅜ per cent at this date last year. To-day, the bank gained £77,000 bullion on balance. The weekly statement of the Bank of France shows losses of 7,425,000 francs gold and 320,000 francs silver.

Bullion Receipts at New York.—The bullion received from the mines at the various offices in this city during the week ended January 12th, as compiled from various sources, amounted to $374,877, as against $496,579.80 reported for the previous week. The receipts from January 1st, 1883, to date, are $871,456.87.

United States Mint.—The coinage executed at the mints of the United States during the year 1882 amounted to 88,805,831 pieces, of the value of $94,820,120.

BULLION PRODUCTION FOR 1882.

We give below a statement showing the latest bullion shipments. These are officially obtained from the companies, where that is possible; and where official statements can not be procured, we take the latest shipments published in those papers nearest to the mines reported. The table gives the amount shipped for the week up to the date given, as well as the aggregate shipments to such date from the first of January, 1882.

The shipments of silver bullion are valued at $1.29·29 per ounce troy; gold at the standard $20.67 per ounce troy. The actual value of the silver in the following table is therefore subject to a discount, depending on the market price of silver. If the price of silver be counted at $1.12 an ounce, which has for some months been about its average value, the following figures, where they relate to silver bullion, should be diminished by about 13⅓ per cent to arrive at actual value.

COAL TRADE REVIEW.

NEW YORK, Friday Evening, Jan. 12.

Anthracite.

Buyers of anthracite coal enter the market only to cover pressing wants, and the market therefore continues to rule dull. The week has been one of expectancy. While the production has been light in consequence of bad weather, which has affected the working of the collieries much more than is generally believed, it is nevertheless true that it appears to be greater than the wants of the market. It is understood quite generally that a conference will be held to-morrow, to decide whether it will be necessary to resort to the policy of restriction, and if so, to what extent. The feeling in the trade seems to be in favor of it. Prices are not better nor are they worse than they have been. The majority of the companies are not pressed for orders, and maintain an attitude of indifference.

The production of anthracite for the week ended January 6th was 430,784 tons, as compared with 453,882 tons the previous week, and 371,298 tons for the corresponding week of 1882. The total product from January 1st to January 6th was 430,784 tons, as against 371,298 tons for the like period of last year, showing an increase this year of 59,436 tons.

Bituminous.

A larger supply of cars to Clearfield shippers, who have ceased buying Cumberland coal, and considerably easier freights from Baltimore, have swelled the quantity of available coal in the hands of some shippers, and with an unchanged demand have produced some weakness. On the other hand, vessels are so scarce at Philadelphia that the shipments from that point have been considerably lessened, so that the supply here of certain of the best grades of Cumberland is small.

We quote alongside Clearfield at $4.60@$4.75, and Cumberland, $4.65@$4.80.

STATISTICS OF COAL PRODUCTION.

Comparative statement of the production of anthracite coal for the week ended January 6th and year from January 1st:

TONS OF 2240 LBS.	1883.		1882.	
	Week.	Year.	Week.	Year.
Wyoming Region.				
D. & H. Canal Co..	57,731	....	49,331	.....

ANOTHER one of the great blasts for which the limestone quarries of the Glendon Iron Company are famous was fired on the 11th. A total charge of 29,000 tons of Judson powder, distributed in six chambers, was fired by Mr. FRANK FIRMSTONE, the quantity of rock displaced being estimated at considerably above 100,000 tons.

THE preliminary work connected with the forthcoming National Exposition of Railway Appliances seems to be progressing favorably. Mr. FRENCH, Acting Secretary of the Treasury, has issued a circular permitting the bonding of the exhibition building and providing for the necessary regulations to allow the entry of foreign goods. From what we can learn, the prospects of the exhibition are very encouraging.

IT seems likely now that the Senate Finance Committee will, by an amendment, alter some of the provisions of its bill relating to iron and steel. They have heard Mr. H. N. OLIVER, who has impressed them with the necessity of discriminating a little more than they have done between the various grades of that very elastic metal, "steel." It is the intention to draw the line somewhere between the ordinary Bessemer ingots at one end of the scale and open-hearth steel made from the best Swedish charcoal-iron at the other end. The pig-iron men have also been active, and have succeeded in convincing the Finance Committee that a reduction of the duty to $6 per ton means utter ruin to large numbers of blast-furnaces, and it is probable that 72 cents will be added to prevent that calamity.

THE annual meeting of the American Society of Civil Engineers was held in this city this week, there being a full attendance. Professionally, the principal interest centered in the discussion of Mr. W. P. SHINN'S remarkable paper on the Increased Efficiency of Railroads for the Transportation of Freight, formal contributions to the subject being made by Messrs. JOHN B. JERVIS and CHARLES PAINE, the newly-elected president, while a number of prominent railroad engineers made short addresses. It is understood that the discussion will again be taken up, and that efforts will be made to bring out the views of a still greater number of specialists. The second day of the meeting was devoted to a visit to a number of points of interest in this city, and the meeting ended with a reception at the rooms of the society.

THE Western sheet-iron roofing manufacturers have addressed a protest to Congress against the unjust discrimination of duties upon sheet-iron in favor of tin plate, the papers bearing the signatures of such firms as SCOTT & Co., W. G. HYNDMAN & Co., the PORTER IRON ROOFING COMPANY, the EUREKA IRON ROOFING COMPANY, all of Cincinnati; O. S. KEELEY & Co., of Indianapolis; and a number of leading manufacturers. They call attention to the fact that the present duty on tin plates, 1·1 cents per pound, is only 20 per cent *ad valorem*, and that, if it were advanced, as proposed, to 2·1 cents per pound, it would be only 40 per cent *ad valorem*. Any decrease in the duty would lead to increased importations of tin plates, and would make further inroads into the market of the home sheet-iron roofing industry, which has been gradually developed, particularly in the West, under heavy disadvantages.

ANNUAL REVIEW OF THE METAL MARKETS FOR 1882.

The year 1882 has on the whole been one devoid of excitement for the metal trade. In all the prominent metals in which Americans are interested as large producers, prices have generally ruled in buyers' favor, and a steady decline in values has taken place, as is proved by a glance at the accompanying summary of prices, quoted, whenever possible, on the basis of actual transactions in large lines. It may be said that this decline is almost wholly due to increased supplies, the growth in production, as we shall show in detail farther on, having been remarkable. Consumers were fairly active, and more than maintained the good record of the previous year. But as the exceptional prosperity of 1880 and 1881 had led to important additions to manufacturing capacity, and the rate of progress of those years was not kept up, there was probably more complaint of dullness than the volume of business really warranted. A manufacturer who turned over a product of 5000 tons of lead a year before 1879 may be ready run to do 9000 tons, and complains of dullness when his business does not foot up to figures which a few years ago would have taxed his capacity.

Except in tin and, at one period, in lead, the speculative element has been almost entirely absent during the year.

The tariff agitation has done considerable havoc to business for the time being. We have so fully expressed our opinions on that subject from week to week that we need add nothing now. Suffice it to say, that at present the prospects are discouraging. Business men throughout the country freely express their willingness to accept reasonable reductions, provided the injurious agitation of the question is brought to a close as speedily as possible. We regret to say that now an early settlement does not seem probable, and many months may pass by before the producing and manufacturing interests of the country know just where they stand. This is very unfortunate, because it will hamper any free movement for a long time, so that the prospects of reasonable activity in business are not good.

The magnitude of the consumption of the leading metals in this country, and of the interests involved, may be approximately presented by the following figures:

Metal.	Consumption.	Average price.	Total value.
Copper	45,000 tons	18c.	$16,200,000
Lead	140,000 "	4½c.	12,600,000
Tin	11,000 "	22c.	4,800,000
Spelter	42,000 "	5c.	4,200,000
Quicksilver	50,000 bottles	36·5c.	1,300,000
			$39,100,000

Antimony and nickel will swell this to a minimum of forty millions of dollars.

Copper.—Last year, we recorded the heavy increase in the production of copper in the West, submitting figures based on careful estimates of the production by gentlemen closely connected with the trade. The many evidences of a very notable increase during the present year induced us to make special efforts to gather statistics of the production in 1882. We take this opportunity to thank the gentlemen in many parts of the country who have cordially assisted us with their aid and advice, and we believe that the result of our work will be a surprise to them as it was to us. We could not, nor did we, attempt to present absolutely accurate data. Many of the mines had not received December returns, others reported only "mineral" or "black copper," others were obtained through reports of refiners, which were hard to be estimated from occasional or scattered figures printed in local newspapers. Information was directly derived only in a few cases. As the figures submitted by refiners represent only actual sales of ingot copper, while those of many mining companies include estimated yield of impure coppers in transit, our data

Digitized by Google

are approximations only. As they stand, however, they are as closely accurate as it is possible to make them at so early a date. We have been particularly careful to avoid duplications, which, for instance, easily occur, because the same copper produced in Montana or Utah may reappear as blister copper or matte in the figures of Colorado works and in the statements of Eastern refiners. Whenever possible, we have referred the amounts to the original source. Another difficulty besetting the statistician in collecting figures for the production of copper is, that a part of the amount, mattes, etc., is converted into blue vitriol, and does not appear upon the market as ingot metal.

We have grouped the returns by States, many of the data submitted being confidential:

PRODUCTION OF COPPER IN 1882.

Michigan.

	1882.	1881.
Calumet & Hecla	32,000,000	31,360,731
Quincy	6,500,000	5,506,848
Osceola	4,175,000	4,179,976
Franklin	3,334,000	2,677,932
Atlantic	2,620,000	2,528,009
Allouez	1,675,000	1,421,433
Pewabic	1,650,000	1,876,244
Central	1,350,000	1,418,465
Conglomerate	766,500	386,091
Grand Portage	675,000	528,866
Copper Falls	601,570	669,121
Hancock	540,575	571,897
Huron	392,000	254,515
Ridge	129,410	235,606
National	20,000	.....
	56,449,055	53,615,784
Other mines assumed equal both years	958,728	958,728
Total	57,407,783	54,574,512

The product of the Calumet & Hecla was 19,946·71 tons of mineral in 1882, against 19,542·03 in 1881. We have assumed that the yield of ingot copper would be the same, that is, 77 per cent, which is lower than it was the fiscal year in 1880, when it was 77·86 per cent. We feel justified, therefore, in putting down the Lake mines at 57½ millions of ingot copper. We have therefore:

Michigan	57,500,000
Arizona	15,560,000
Montana	10,000,000
California	1,000,000
Colorado and Utah	1,000,000
Vermont	1,265,000
New Mexico	870,000
Imported pyrites	1,000,000
Nevada	400,000
Missouri	295,000
Eastern and Southern States	750,000
Miscellaneous, desilverizers, etc.	500,000
Total	90,140,000

In the above figures, Arizona includes the Copper Queen, the Longfellow, Old Dominion, Pima, Columbia, Russell, Buffalo, Neptune, Long Island, and Detroit. The Montana production is an estimate from refiners' returns, as most of the copper goes through their hands, to which estimated exports have been added. In California, the principal copper producer is the San Francisco, at Spenceville. Colorado includes the product of the Mammoth in Utah, but does not include the figures of the Colorado & Montana Smelting Company and the Bell Company, both of Butte City, Montana, whose shipments are included in those of the Boston & Colorado works at Argo, Colo. Vermont includes returns of the Ely and Elizabeth mines, the former sending the product to Ansonia, Connecticut. The copper from imported pyrites is obtained chiefly from Canadian ore, and the bulk is probably re-exported in the form of matte. The Nevada product is almost entirely a poor grade of mineral copper, which we believe has not yet been refined. Missouri appears for the first time as a producer of refined copper, the quantity given being almost exclusively that of the company working at Genevieve. The estimates given for Eastern and Southern States include Maine, New Hampshire, Pennsylvania, Maryland, Georgia, Tennessee, and Alabama, It may be assumed from these figures, which have been largely checked by refiners' returns, that the total product of the country was not less than 90 millions of copper.

Of this quantity, 2,400,000 pounds of Lake, 2,000,000 pounds of Montana matte copper, 1,000,000 of pyrites mattes and 500,000 pounds of miscellaneous coppers, as cement, etc., were exported, or roughly, six millions of copper, leaving the approximate consumption at about 84 millions of pounds of ingot copper. This, it will be conceded, is unprecedented, and is eloquent proof of the great expansion in the demand. The principal increase has been in the requirements of the electric lighting companies for wire and in the use of brass for ornamental and machinery purposes. We have a report from one of the great electric lighting companies, stating that its consumption during the last year had been 6,000,000 pounds, and was likely to be larger this year.

As for the prospects of production during the present year, it is necessary to note that, besides the large mines in the Lake district, which in general show an increase due to reduction of cost by improvements in mining, the use of rock-drills, etc., and greater facilities in handling larger masses of rock in the stamp-mills, there are coming up new promising concerns. Among these is the Conglomerate, whose product this year was entirely from prospecting; the Peninsula, Wolverine, and others, all getting ready for work on a large scale. In Arizona, the larger mines, like the Copper Queen, Longfellow, and Old Dominion, are now producing at a considerably greater rate than their average during the year, and all of them will probably increase their record for 1883 considerably. A number of the others are now, and probably will be, hampered by lack of metallurgical talent, or the absence of sufficient capital. With coke ranging from $60 to $70 per ton, and high labor and freight, none but very high-grade ores will pay, and they only in well-arranged and carefully conducted plants, backed by ample capital. We shall probably hear during the year of the beginning of operations of a number of works now building, and of resumption of others now idle; but we do not expect that, after all, the aggregate of the smaller works will be much heavier than it was this year, say at the utmost five or six millions. This is largely the case too with New Mexico concerns. Utah and Colorado will probably do better, and a very considerable increase may be expected from Montana. Taking the whole, we look forward to a material addition to our copper product during the year 1883.

During the year, the Lake companies have continued to pursue the policy of marketing their copper in large blocks, dealing directly with consumers. As the quantities taken by dealers or speculators were small, outside transactions were limited, and the quotations of Lake copper were therefore frequently nominal. We have, therefore, added to our list a column showing the variations in the price of Baltimore, as furnishing a better indication of the weekly fluctuations of the market. Here the transactions are frequently made on private terms, and our quotations probably, on an average, represent holders' views. Considerable outside Western copper does not reach the open market, going directly from the hands of a large firm, manufacturing refiners and dealers, into their own mills and to their own trade. It will be understood, therefore, that it is a difficult matter to follow closely the variations in the metal.

The year opened with a quiet market, showing occasional signs of weakness, as manufacturers were well supplied, and there was little inquiry. Speculators were induced to take hold at lower prices, but unfavorable advices from abroad had a depressing influence. February opened with buyers in an expectant attitude, but firmly declining to pay current figures, which gradually gave way, until, at the close of the month, there were somewhat more liberal purchases at 19@19¼ cents for Lake. Stocks began to get to a low ebb; but the unbroken front presented by consumers caused a further decline, so that April opened at 18½ cents, and a week later the market stood at 18¼ cents. In the middle of April, the companies gave way, selling twenty millions of pounds of Lake at 18 cents. Meanwhile, offerings of outside brands became more liberal, and a considerable quantity was cleared away at rising prices. June, July, and August passed quietly, with values well sustained, but a limited business, until, in the beginning of September, the Lake companies sold between 10 and 11 millions of copper at the reported price of 18 cents, followed by sales of round lots of Baltimore at 17½ cents, and, toward the close of the month, of a million of Arizona copper at 17⅜ cents, and lots of other kinds at low figures. The market was somewhat relieved of the pressure of these brands of copper by exports of mattes, but did not recover sufficiently to hold prices, which gradually but steadily declined untill the close of the year.

The following statistics by Messrs. James & Shakspeare, of London, show the position of the metal at the close of the year in England and France:

		Jan. 1 to Dec. 31. 1882.	1881.	1880.
Imports.	Chili	42,306	40,589	45,499
	Other foreign	35,571	35,888	33,865
Tons		77,877	76,477	79,364
Deliveries.	Chili	43,502	50,890	43,328
	Other foreign	37,991	34,836	31,839
Tons		81,493	85,726	75,167
		Dec. 31, 1881.		Dec. 31, 1882.
Stocks.	England	35,306		32,623
	France	3,437		2,504
Total stocks		38,743		35,127
Afloat		11,120		11,460
Tons		49,863		46,587

Tin.—This metal has become the favorite foot-ball of speculative cliques on both sides of the Atlantic. With the principal mines of supply at a distance, where it is difficult to watch the development of production, which is extremely variable, from the nature of the deposits, and is subject to droughts, etc., it is natural that rapid variations in values should take place. Besides this, past experience in the tricks resorted to to "fix" statistics has rendered the latter unreliable. The history of the metal is therefore little more than a record of the achievements of bulls and bears. The bulls had it their own way in the beginning of the year, but were somewhat frightened in January by the French panic. In February, they again obtained the ascendency, but lost their hold during the close of March, when London went down to £88, our own market following. London recovered and fluctuated for a while without affecting prices here much. The market was quiet and dull during May and June; but the Egyptian troubles and the temporary closing of the Suez Canal again rushed prices upward; but toward the end of the month, a more favorable turn of affairs in Egypt caused a reaction in London, to which our market partly responded. The metal had meanwhile got into firm hands here, and maintained its position fairly well; but the apathy of consumers caused a steady decline during October, November, and December. Since the beginning of the year, the 10 per cent differential duty discriminating against tin not imported directly from beyond the Cape of Good Hope has been abolished, and now New York will probably, more closely than ever, follow the movements of the London market.

Lead.—The most important feature affecting the business during the year 1882 has been the great increase in the production. We have made special efforts this year to obtain data upon which to base an estimate of the output, and we are pleased to state that we have been furnished with figures in the most liberal manner by all the leading desilverizing works in the country. We are not at liberty to give the items in detail; but we may state that returns from the Richmond works at Eureka, Nevada; the Germania works, Salt Lake City, Utah; the Pueblo, Colorado; the Omaha, Neb.; the Kansas City, St. Louis; the Horn-Silver, Chicago, the Pittsburg, and Balbach & Sons', Newark, N. J., works aggregate 99,700 net tons of refined lead. In the absence of returns, we estimate the Selby works at San Francisco, the Delaware works, Philadelphia, and the Manhattan works in this city, together, at minimum of 6300 tons, which would make the total of desilverized lead 106,000 tons. To this must be added the product of Missouri and Kansas, which is so much scattered that we have not been able to obtain direct returns in sufficient number to warrant an estimate. We place, however, on very good authority—that of Messrs. John Wahl & Co., of St. Louis—the output at 631,721 pigs, at 80 pounds, or 25,268 tons. Assuming the entire product of Missouri, Kansas, and Illinois at 30,000 tons, we reach a total of 136,000 tons. To this it is necessary to add 2000 tons, being the product of such works as the Castle Dome Company, of California, which cupels rich silver-lead, and the make of small quantities in Virginia and elsewhere. We believe, therefore, that we are as close to the actual production as preliminary estimates at s

Digitized by Google

early a date can make it, when we say that the total make of lead is 138,000 net tons. This will probably closely represent the amount which was marketed. Assuming that the stocks are now slightly greater than they were a year ago, it must be remembered that the Richmond Company, of Eureka, brought upon the market several thousand tons of lead more than it produced, thus diminishing its stock, which is now between 7000 and 8000 tons of lead. That such an enormous quantity of metal should have passed out of the hands of producers into that of consumers, without seriously disturbing the price, is one of the most encouraging signs for the future. There can be no doubt that consumption was very heavy. The lead business is so closely dependent upon the prosperity of the building trades that any unusual activity in the latter aids the former. Statistics, published at the close of last year have shown that 1882 has fairly kept up the extraordinary record of 1881 in this city, Brooklyn, and Philadelphia. The demand in the East has been fully up to that of the preceding year. In the West, the increase has been very noteworthy, particularly so far as the manufacture of white-lead is concerned; but it is probable that a part of this increase is due to a transfer of business from Eastern to Western corroders. It is a noteworthy fact that the greatest increase in the manufacture of lead is taking place nearer the sources of supply, a very natural result of the circumstance that the greatest expansion of the population is going on nearer to them.

We have not attempted, however interesting such an inquiry would be, to trace the source of the lead now in course of production. We know from local statistics, gathered, evidently, with much care, and therefore trustworthy, the output of such districts as the Leadville and the Utah region. But there are, scattered in so many mining camps in Colorado, Montana, Utah, Nevada, New Mexico, and Idaho, so many small smelters, working by fits and starts, and frequently changing owners, that it would be impossible to gather the facts, except after many months' tedious correspondence. Suffice it to say, that Colorado, Utah, and Nevada lead in the Rocky Mountains. Leadville, with the smelters of which it is the main source of supply, both in the district and at a distance from it, has kept up its remarkable record, and, from all we can learn now, is likely to do as well this year. It has made tributary to it many smaller camps, which are turning out growing quantities of ore. The smelting business proper is not in a very satisfactory condition; but the sharp competition among the works aids development and fosters production.

In Utah, the Horn-Silver stands pre-eminent, with a record of 16,101 tons of refined lead, and the question whether the present rate can be kept up is an important factor in the market. From all that we can learn, the prospects are still favorable for the coming year.

In the Eureka District, the Richmond has been falling behind materially; but it is likely that the output of the Eureka and Albion mines will fully make up for the deficiency and carry the product to higher figures, even if the developments in the Richmond should be unsatisfactory during the year.

The most important increase in the production during the coming year will come from Idaho. It is now proved beyond a doubt that there are a number of mines capable of a large production in the Wood River and other districts, however overrated some individual properties may be. The ores are mostly galenas, which tell heavily when smelting operations have once been started and better transportation facilities are afforded.

Montana, from the accounts which reach us concerning the principal lead-silver mines, will make a fair record, and New Mexico is also likely to come to the front as a producer.

Throughout the year, quite a number of smelting plants have been erected in various sections of the Rocky Mountains; but it is within our knowledge that some of them have languished from some fatal defect of location or management, while others are not likely ever to figure prominently in the returns. Still, the capacity has been largely increased, and the numerous additions to the railroad mileage of many sections has rendered the receipt of raw materials and the shipment of product easier. We do not therefore see any prospect of a decline in the production this year.

Nearly all of the Western desilverizing works, from Pueblo to Pittsburg, have done full work and have been crowded. Their number has been increased by two during the year, one of which, the works at Aurora, Ill., is now beginning operations. The second, built by the Chicago Smelting and Refining Company, at Chicago, was reported to be a model plant, with many improvements, notably as regards the reduction in the consumption of fuel by the use of gas firing. Unfortunately, these works were destroyed by fire this week. It may be of interest to state here, as showing the very large business done by desilverizers, that returns received from five works, producing in the aggregate 49,300 tons of refined lead, turned out $9,022,000 of silver and $694,000 of gold, not counting the silver and gold produced from jewelry sweeps or by parting doré bars delivered directly. It seems probable, therefore, that the eleven works operating during the year have turned out nearly twenty millions of gold and silver, besides producing 111,500 tons of lead, valued at an average price of 4·50 cents per pound, or ten millions of dollars. The total value of the product of the desilverizing works in the country is therefore above thirty millions of dollars, exclusive of outside parting and sweep-smelting business.

In January, the market opened with growing signs of weakness, in spite of light spot stocks, the pressure coming chiefly from the West, and transactions were limited until, in the beginning of February, 2000 tons of Richmond lead were sold in one block, at 5 cents, for delivery in February, March, and April, followed by heavier business at better figures. The market weakened, however, during the following weeks, and, by the middle of March, had gone below 5 cents, chiefly, it seems, in consequence of rumors that foreign lead could be laid down here at current quotations. A week later, it was learned that the Richmond Company, of Nevada, had succeeded in making arrangements for shipping lead via New Orleans; and the uncertainty as to the extent of this movement brought the market to a stand-still, by creating the impression among buyers that heavy reductions would be granted. The Richmond Company, during the first week in April, again sold 3000 tons at 4·85 cents, which was promptly followed by sales of 600 tons at 5@5·05 cents. The market dragged along during the month of May, a steady decline alone inducing buyers to take hold from time to time. With a sale of 3000 tons more of Richmond lead hanging

HIGHEST AND LOWEST PRICES FOR EACH SIX MONTHS.

	Jan. to June. H.	Jan. to June. L.	July to Dec. H.	July to Dec. L.
Copper, Baltimore	20·25	17·50	17·75	17·25
Copper, Lake	20·50	18.00	18·25	17·87
Tin, Straits	25·25	20·25	25·75	21·00
Pig-Lead, common domestic	5·20	4·55	5·12½	4·50
Spelter	5·87	5·33	5·40	4·62
Antimony, Cookson's	15 25	13·50	13·50	11·62

over the market, prices receded to 4·55 cents in the beginning of June. It reacted slightly, owing to a better feeling in the West, and developed further strength during the month. In the first week of July, the Richmond Company disposed of 5000 tons at 4·92½ cents, chiefly taken on speculative account, the understanding being that the company would not sell any more lead during the year. Simultaneously, about 2000 tons of other brands of lead were taken at about the same figure, consumers supplying themselves for any future emergency. The available stock was, therefore, practically concentrated in the hands of one party, who promptly advanced jobbing lots to 5·10@5·15 cents. The market dragged along during July and August, showing symptoms of weakness at the close. The feeling was a little better during September, the party holding the bulk of the spot supply taking up any stray lots. Buyers in October began more and more to display a determination to take nothing beyond immediate and pressing wants, and by the beginning of November, free offerings of outside lead, particularly refined, carried the price down to 4·80 cents. In the third week in November, the market fairly gave way under sales of 2000 tons, declining to 4⅝ cents, and a week later had reached 4½ cents. In December, the metal slowly rallied, partly under the influence of favorable reports from Washington, the year closing with a very quiet market and quotations at 4·75 cents for Common, and the same nominally for Refined.

We give below the average price for common domestic lead for a series of years:

	1878.	1879.	1880.	1881.	1882.
January	4⅛	4¼	6	5	5⅛
February	3⅝	4⅝	6	4⅞	5¼
March	3¾	4	5½	4⅞	5
April	3¾	3	5⅝	4⅞	5
May	3½	3	4¾	4⅝	4⅝
June	3⅛	3¾	4⅝	4⅜	4⅞
July	3⅛	4	4⅞	5	5
August	3⅜	4⅛	4¾	5	5
September	3⅜	4	4⅞	5¼	5⅛
October	3½	5¼	4⅝	5⅜	5
November	3⅜	5½	5¼	5	4¼
December	4	5¾	5⅜	5⅛	4⅜

Spelter.—The year under review has been a particularly severe one to the zinc industries of this country. Low prices abroad and the comparatively high price in this country, with a large prospective demand, caused foreign makers to ship heavily to this market, a movement which was intensified by speculative importations and by a desire on the part of for-

Digitized by Google

eign makers to hold lower prices by selling their surplus here even at unremunerative figures. Imports which for years had not been more on an average than 2500 tons rushed up to a monthly rate of 1000 tons, and at the end of the first nine months had reached 10,660 tons, so that they will not fall short of 11,500 tons for the year. Meanwhile, the center of production in our own country was moving Westward, and great activity was displayed in building in Southwest Missouri and Kansas. The importance of this district may be gathered from the following estimates of capacity sent to us by one of the makers of the district:

	Tons.
Southwest Lead and Zinc Company, Rich Hill, Mo	2,000
Joplin Zinc Company, Joplin, Mo	2,000
R. Lanyon & Co., Pittsburg, Kansas	3,500
S. H. Lanyon & Brother, Pittsburg, Kansas	1,750
W. & J. Lanyon, " "	900
Granby M. and S. Company," "	1,750
J. H. C. Gross, Weir City, Kansas	3,500
Total Southwest Missouri and Kansas	15,400

We estimate the output this year at 9000 tons, and the rest of the West at 17,000 tons, of which a very large proportion is converted into sheet. The East and South are placed by good authorities at nearly 4000 tons, so that a total of 30,000 net tons is reached. These figures will, we believe, fully explain the steady downward course during the year, and the fact that prices have receded even after foreign metal was practically excluded is ample proof that there are stocks still pressing on the market. It is not believed that prices for the metal, which is now in the extraordinary position of being as cheap as lead, can go lower, because the prices of ore are at their bottom figure. The royalty demanded and received by owners of the fee, and the increased depth of workings enhancing the cost, render any reductions impossible. Already a considerable proportion of the capacity is idle. The consumption is largely dependent upon a continuance of the demand for galvanizing and for sheet. The present low prices, of course, will stimulate the demand; but the producing interests will maintain a very conservative position so long as there is any uncertainty as to tariff legislation. Any reduction in the duty would promptly deliver the Eastern markets over to foreign producers, and our home works, limited to a narrow field, would be decimated until the production had adapted itself to the requirements of the smaller outlet.

CORRESPONDENCE.

Suggestions to Young Assayers.

EDITOR ENGINEERING AND MINING JOURNAL:

SIR: The first step in the business life of many of the graduates of our schools of metallurgy is an appointment as assayer to some smelting or ore-sampling works. It is the natural stepping-stone to higher positions in the future, and should be eagerly sought for by any young man who, after having completed his scientific studies, desires thoroughly to fit himself for the position of superintendent or manager, as it enables him to acquire an intimate knowledge of the business, and gives him an opportunity to see carried out in practice the various processes which he has studied in the lecture-room or laboratory. But the incapacity of many—I fear even I must say most—of the graduates of our best metallurgical schools to fill the position of assayer to the satisfaction of their employer, is a matter of astonishment and disappointment to myself in common with many brother superintendents. It is not that they are lacking in theoretical knowledge; nearly all are thoroughly drilled in all that can be learned from books pertaining to their especial branch; but it is in the faculty rapidly and systematically to turn off a large amount of accurate work, and to realize the immense importance of the results of their labors, that they are wanting. But unless they are told what their future work is likely to be, and have had shown them the particular branches in which it is necessary to perfect themselves, they can hardly be held responsible for some shortcomings in this particular. For many reasons, it would be well if every professor of metallurgy or instructor in chemistry could have served a term as assayer, and subsequently as superintendent, of some active metallurgical establishment, where he could fully realize the difficulties and annoyances that are sure to beset the novice, and learn what branches of his science should receive an extra share of study and practice, and what could be somewhat slighted without serious disadvantage.

The object of this article is to point out, with all due respect to both instructors and students, and from a superintendent's stand-point, the branches which ought to receive more attention, my opinion being formed from my own experience in employing, and seeing employed, some dozen or fifteen young men, all graduates of good mining schools, either American or foreign. I assume, of course, that the student can make an accurate gold and silver assay, as this process nearly always receives much attention, and is so striking and accurate that it is universally practiced with much pleasure and satisfaction. But I have nearly always found that the student is far too slow in his work, having been accustomed in many college laboratories to work with a small muffle, have an assistant to regulate the firing, and being in the habit of making only a few scorifications at any one time. It would save the young assayer much mortification and hard work in his first introduction in practical life, if he had been trained to test and regulate his own balance, do his own firing, and, working with a muffle holding say from twenty to thirty scorifiers, to weigh out, scorify, and cupel some sixty assays before dinner, reserving the afternoon to weigh his buttons, do his parting, and fill out his certificates. I dare say this may be the practice in some of our schools. I am only writing for those where it is customary to only require two or three scorifications from the student as a morning's work, and where the supervision is made easy for the professor, by having a skilled assistant to attend to the balances, firing, etc.

Another assay, which was not taught during my school years (at Freiberg), and which is one of the most useful and accurate that we have, is the crucible assay with litharge and soda, for gold and silver ores containing little sulphur and base metals—"dry ores." It takes the place of several scorification assays, as so large a quantity can be used at one time; and for surface quartz or mill tailings, containing small quantities of gold, is almost the only practicable method quickly and cheaply to arrive at reliable results. Few balances that may be found in the laboratories of ordinary smelting-works are delicate enough to give accurate results in gold assaying, and the student should be fully capable of determining this point, and should at once relieve himself of responsibility by reporting this fact to the superintendent.

He should also be able to granulate his own assay lead, and manufacture his own cupels. Possessing this knowledge, he can easily break in his assistant to the work, as well as to the management of the furnace.

Regarding lead assaying, I have little to say. The method itself is simple enough, but it requires much practice to obtain uniform results.

Copper, on the contrary, is a much more difficult metal to deal with. Without going into a discussion of the merits of the numerous methods in use, I will merely say that perfectly satisfactory results may be obtained by the two following methods:

1. Decolorization of the ammoniacal solution by a standard solution of cyanide of potassium.

2. Precipitation on platinum by the battery.

The first method has fallen somewhat into disrepute by careless working, and by employing it under improper conditions. In the absence of zinc, or large amounts of arsenic, antimony, nickel, or cobalt, and by observing proper precautions—titrating in the cold, and using measured amounts of acid and ammonia—the cyanide assay is quite accurate enough for ordinary working assays; that is, determination of the copper in slags, mattes, etc., for the guidance of the metallurgist, and may be made still more satisfactory by decanting the filtrate from the heavy red precipitate, when there is much iron present, and washing two or three times with hot water.

For quick work especially, such as determining the amount of sulphate and oxide of copper during matte or ore-calcination, this method is simply indispensable, and yet in almost every instance I have been obliged to teach each new chemist in my employ how to carry it out, and have been regarded at first as a most unreasonable task-master, when I have brought in a dozen samples from the furnaces in the morning, and told my new assistant that I expected results by the middle of the afternoon.

This assay should be practiced by all would-be assayers until they arrive at great accuracy and speed in its execution. The second method by the battery is always taught at colleges, I suppose, and should be used in duplicate in assaying commercial samples, or wherever great accuracy is desired without so much regard to speed.

The quantitative determination of sulphur is constantly required at smelting-works, and yet I have found few students who could do it accurately in an hour or two. There is only one method, so far as I know, that need ever be employed in metallurgical works. Dissolve the finely-powdered material in fuming nitric acid at a very low heat, until all sulphur is oxidized; evaporate, dissolve in hydrochloric acid, dilute, and titrate at a boiling temperature with a standard solution of chloride of barium. The fact that so few of my assistants have been familiar with this quick and excellent method, is my excuse for stating it here, however familiar it may be to some of my readers.

If, to the above list, I add the ability to make an accurate and speedy determination of silica and lime, and to determine the specific gravity of bodies both heavier and lighter than water, I shall have enumerated the principal qualifications essential to such an assayer as would suit my purposes, at least.

I am well aware that I am saying nothing new or original; but I am also aware that there is a lamentable deficiency on the part of students in this direction, and I have already stated that, during some twelve years or more of active metallurgical work, I have not found a single recent graduate, myself included, who could perform all the operations just indicated in a manner satisfactory to his superintendent.

I think I need hardly explain that I have not intended the above remarks as a description of the way in which the methods mentioned should be carried out, but merely as a catalogue of the processes in which the student should perfect himself before applying for the position of assayer. With this apology for the space that I have taken, I remain, yours very truly,

E. D. PETERS, JR.,
Assistant Manager Orford Nickel and Copper Co., former Territorial Assayer of Colorado, etc., etc.

NEW YORK, Jan. 15, 1883.

Green Mountain Matters.

EDITOR ENGINEERING AND MINING JOURNAL:

SIR: In your issue of November 11th, 1882, you referred to a "confidential" circular and other matters concerning the Green Mountain Gold Mining Company, of California. A report by Mr. Patten, of Comstock fame, is alluded to. It may not be amiss to state, for the benefit of the stockholders, some of the circumstances attending the origin of this report, as I feel sure that many of them regard your reference to Patten, as the maker of it, as an error, meaning to refer to Professor Blake's report. Prof. William P. Blake had been the consulting engineer employed by the company from its origin, and furnished his last report on the condition of the mine under date of November 3d, 1882, a copy of which I inclose you. This report was printed and mailed to the stockholders. It does not take a very gloomy view of the company's prospects; on the contrary, it may be considered fairly encouraging; but it does clearly show that his recommendations had not been acted upon, and in language moderate yet unmistakable places the responsibility on the management. His report, as a consequence, did not suit them, as is evidenced by the fact that the services of Mr. Patten were called in to make the report to which you referred. The necessity for this second report, in the face of Professor Blake's usual report and contemporaneous therewith, is not very apparent to the average outside stockholder, and suspicion has been aroused in the minds of those who have called at the office of the company, and have become aware of its contents.

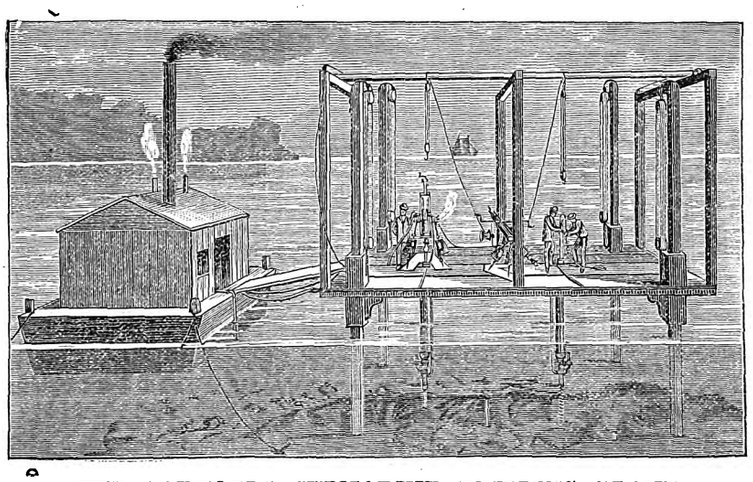
Now, as to the condition of the mine, and what has brought it about, a few circumstances are worthy of notice. According to reports of the management during April, May, June, and July, the mine and mill produced net profits. July was fully up to the average, producing about $7000 net. Mr. Vernan, vice-president of the company, arrived at the mine on or about the 29th of July. August showed a deficit of $3500. September showed a deficit, as did also October, November, and the first

Digitized by Google

half of December. About the middle of December, Mr. Vernan left the mine, and singularly enough, the latter half of December showed a net profit of about $2350.

These are what the management call facts. I make no comments, but simply quote from a letter of late date received from a perfectly reliable gentleman, who resides in the vicinity of the mine and is conversant with every part of the property, having peculiar facilities for acquiring his information: "Soon after Mr. Vernan came here, ore ceased to be taken from the lower levels of the mine, where the best was always found. The men were moved to old workings near the summit of the mountain, where the ore was always poor, and this is what is now being milled and has been for months past. There is a ledge of as good rock as any ever milled there, that is at least twelve feet wide, and an immense amount of it in sight. Said one of the miner's to-day, 'I wish I had two dollars for every ton in sight; I would be a millionaire.' There is not a man employed about or who knows the mine who would not make oath that every one of the ninety-two stamps can to-morrow be fully supplied with good paying ore, and kept supplied for an indefinite time. Some of the statements contained in the circulars (confidential) you sent me are grossly false." These are facts from another source.

I also call your attention to the editorial and the mining notice in the Greenville *Bulletin* of January 3d, 1883, which I hope you will reprint for the benefit of innocent stockholders, quite a number of whom are women, as the stock-book shows, who possibly are dependent on the income derived from this investment.



At the annual meeting to be held next week, the stockholders will do well to inquire into these matters. Very respectfully,

L. B. 51, W. F. H.

CARLISLE, PA., Jan. 16.

RECENT IMPROVEMENTS IN SUBMARINE DRILLING.

Submarine rock excavation has been a costly and laborious work, particularly so when the submerged reefs were covered with strata of sand, gravel, or silt. With the object of relieving the drill of the friction occasioned by the pressure of the superposed loose material, and to remove the *débris* and cuttings from the bottom of the holes as rapidly as possible, Mr. William L. Saunders, an engineer who has had considerable experience in this class of work, designed and patented an apparatus embracing some novel and valuable features. Mr. Saunders surrounds his drill with a tube, the lower section of which is provided with a tapering extension, to which a tube is connected pointing upward and having an internal diameter slightly greater than that of the hole to be drilled. A small pipe is carried down to near the bottom of the hole, parallel with the steel drilling-rod, while a second larger pipe enters the extension already spoken of, ending in a nozzle within it, also pointing upward. This part of the apparatus, Mr. Saunders calls the ejector. Its function is to provide for the discharge of the *débris* from the hole. This is attained by blowing steam or forcing water through the pipe and the nozzle spoken of. The small pipe which is parallel with the drill-rod and which enters the hole with it, serves the purpose of conveying the *débris* out of the hole and bringing them within the range of the injector.

THE SAUNDERS SUBMARINE DRILLING PLANT.

When a hole is to be drilled into rock covered by alluvial layers, the casing is lowered and water is forced through the small pipe. The casing sinks in by its own weight until it reaches bed-rock. The drill-rod is then introduced and drilling proceeds in the ordinary way, except that Mr. Saunders has so modified the plan that the drill-rod can be extended without drawing it from the hole. The constant scouring of the hole naturally considerably aids progress, and we shall farther on quote some figures from actual practice, to show what has been done. Another advantage is obtained by the use of the casing in charging the holes. As it is ordinarily done, a driver plugs up every hole after it is drilled, in order to keep it free from sand, etc. This is rarely thoroughly done, nor is the hole well cleared before charging. The result is, that the depth of effective hole is considerably impaired. Mr. Saunders introduces his charge through the tube immediately after the tube has been thoroughly secured, and by simple arrangements the person in charge can readily note whether the charge is really at the bottom of the hole. The services of a driver are thus dispensed with in most cases.

Mr. Saunders has, in addition to this, simplified the plant by providing a drill stage, the principal features of which are shown in the accompanying engraving which also shows two of his ejectors. By a small wrench, the stage, after being floated into place, is hoisted above the water, so that it is not affected by changes of tide. A six-inch pipe rolling along the top of the gallows-frames affords facilities for handling the drills, which are of the well-known Ingersoll pattern, and which are provided with a special bed-plate. The boiler and pump are placed on a separate scow. As most of the holes are drilled at an angle, it is generally only necessary to raise the ejector a short distance above the surface of the rock to let it swing entirely out of the range of the shot. We are informed by Mr. Saunders that the Ingersoll Rock Drill Company of this city is the manufacturer of this plant, and that it undertakes submarine excavation work.

We have before us a very interesting report of the operations on Black Tom Reef, New York Harbor, from the beginning of work, May 2d, 1881, to August 21st, 1882. In 283 net working days 17,658 lineal feet of hole were drilled, 16,567 feet being effective drilling. Out of 1736 holes and 1629 charged, 1542 were blasted. The average depth of the holes was 10·17 feet, and the distance between them four feet. The area drilled over was 32,100 square feet, and 5136 cubic feet of rock were removed with three drills, using 20,461½ pounds of dynamite, 200·19 tons of coal, 394·48 pounds of steel, 77·25 pounds of connecting wire, and 7 rolls of rubber tape for covering connections. The total cost of plant was about $15,500.

The largest diameter of bit was 3·75 inches, and the smallest 2·5 inches, the average loss of gauge per lineal foot of hole drilled being 0·03 inch. The cost of labor, repairs, and supplies is very low, the total being far below the figures usually accepted for such work. Holes have been drilled, charged, and blasted with the Saunders injector through six feet of gravel overlying the rock.

SULPHUR DEPOSITS IN UTAH AND NEVADA.*

By Israel C. Russell.

Sulphur deposits of sufficient extent to attract attention from their economic importance have been visited by the writer at three localities in the Great Basin. These are located at Cove Creek, Millard County, Utah; near Humboldt House, Humboldt County, Nevada; and at Rabbit-Hole, on the eastern edge of the Black Rock desert, in Northwestern Nevada.

SULPHUR DEPOSITS AT COVE CREEK.

Of these deposits, the most interesting to the geologist are those occurring at Cove Creek, in Southern Utah. This locality is on the eastern border of the Great Basin and at the western edge of the region of the high plateaus recently described by Captain Dutton. Eastward is a high range of trachytic mountains, that sweep around to the northwest and southeast, forming a crescent-shaped alcove in the western face of the range, the points of which are about ten miles apart. Between the horns of this crescent, and three or four miles southwest of the Ranch Fort, at Cove Creek, is a conical mountain of basalt, having the ruins of a cinder cone at the summit; for convenience, we shall call this old volcano the Cove Creek crater. From the perfection of its outlines, this crater seems to be of a very recent date, but is clothed with a scattered growth of cedars. Judging from its general appearance and the amount of weathering it has suffered, it is probably older than the post-Bonneville craters near Fillmore, Utah. The Cove Creek crater is now in the condition of a nearly extinct fumerole, as hot air and gases are said to escape from cracks and fissures near the summit of the mountain. The area between the base of the crater and the mountains to the eastward of Cove Creek is occupied by subaërial gravels, except along the immediate base of the eastern range, where volcanic tufas appear at an umber of localities. Along the line where the alluvium slopes upward to meet the tufas and volcanic rocks, is where most of the sulphur mines have been opened.

Prospecting for sulphur was begun at Cove Creek, about ten years since, by Mr. C. A. Semler, and has been carried forward by him with much energy ever since. At the present time, fifteen mines have been located, a few of which have been developed to a slight extent, and a large number of prospects opened. The mines, however, have not yet been worked sufficiently to make the sulphur from this locality an article of commerce. From the hasty examination that I was enabled to make, I find that the deposits at Cove Creek arrange themselves in three convenient groups, the divisions depending, however, more on the nature of the cavities that have received the sulphur than on any difference in the manner in which it has been introduced. In one instance, the sulphur occupies a nearly extinct solfatara; again we find it impregnating and cementing beds of volcanic tufa; at other times, the sides of fissures are sheathed with a brilliant drusy lining of sulphur crystals. In all of these instances, it is evident that the sulphur has been derived from deeply-seated sources, having been expelled in a gaseous form and condensed and crystallized in the cavities and fissures in the cooler rocks above.

In the mine named the Cleveland by Mr. Semler, situated about two miles southward of the fort at Cove Creek, the sulphur occurs in quantity, filling the crater of a solfatara. The bottom of the little valley in which the Cleveland is situated, is nearly circular, with a diameter of about 1200 feet, and is totally destitute of vegetation. Over the level surface of the strange little desert, the sulphur outcrops in many places, forming ledges of sulphur; and a number of prospects show an abundance of quite pure material. A shaft was sunk in the center of this deposit, to the depth of twenty-five feet, all in pure sulphur, as I was informed by Mr. Semler. The material taken from this shaft has been returned to it, in order to guard against the burning of the mine, and the broken fragments are now cemented into a solid mass by the sulphur that has been deposited in the interstices between the broken masses. The deposition of sulphur is still in progress, the prospecting-holes becoming lined in a few days with most beautiful plumb-like crystals of pure sulphur. The temperature in all the openings in this sulphur-bed is high. At the surface of one of the prospecting-holes which had been refilled with broken fragments, the thermometer read 104° Fahr.; and through all the openings vapor and heated gases are constantly escaping. In cold weather, the clouds of vapor forming above this mine may be

* A paper read before the New York Academy of Sciences.

Digitized by Google

observed from a distance of a mile or two. The drops of moisture that condense on any cold object held for a moment in the excavations are intensely acid, and from their taste seem to contain a large proportion of sulphuric acid. No chemical examinations of these acid drops or of the gases that are constantly escaping from the openings could be made. It is noticeable, however, that no odor of sulphureted hydrogen can be detected about the mines; but from a few simple tests, and from the presence of dead animals in a large number of the openings, it seems evident that carbonic acid is exhaled in large quantities. The sulphur at this locality covers a circular area of about 1000 feet in diameter, and from the prospects that have been reported, can not be less than twenty-five feet thick. This is not pure sulphur, however, but certainly carries a large percentage of earthy matter. The conclusion arrived at, from a hurried inspection of this interesting locality, is, that the sulphur fills a nearly extinct solfatara, into which it has been conducted from below, seemingly by direct sublimation, or, what is perhaps more probable, by the decomposition of sulphurous gases, and the deposition of the liberated sulphur. A careful examination of the fumes that are exhaled from these openings would certainly be of much value in determining the chemical history of sulphur deposits.

Of the second class of mines—those in which the sulphur impregnates beds of volcanic tufa—we have examples in the Mariposa and the Prince Albert, situated at the base of the mountains, two miles east of the fort at Cove Creek. At these localities, the tufa is stratified, and contains scattered pebbles of quartzite and limestone, and is impregnated over a large area with sulphur, which fills all the interstices of the rock. Judging by the eye alone, much of the tufa contains from ten to forty per cent of sulphur, while in localities the rock is far richer than this. Overplacing the tufa are alluvial cones of gravel, that are in some places cemented by sulphur in the same manner as the strata of tufa beneath, thus showing that the beds now carrying the sulphur have acted simply as condensers for the sulphur, which in every case has been derived from a deeper source.

The third class of sulphur deposits—those in which the sulphur forms a lining of crystals on the sides of fissures—are illustrated by the Philadelphia and Mammoth mines. At the first of these, situated one mile north of Cove Creek, the sulphur occurs in drusy crystals covering the sides of small intersecting fissures in trachyte. The rock has here been much broken along a line of faulting, which may be traced southward to the top of the Cove Creek crater. The Mammoth mine is of a similar character, but found in dark carboniferous limestone. This mine is located on the top of the divide between Cove Creek and Dog Valley to the northward. While standing on this pass, the line of faulting on which the Mammoth mine is situated may easily be traced southward to the valley of Cove Creek; and across the valley, it is again seen as a bold fault-scarp, with a throw to the westward, ascending the side of the volcanic crater that we have already mentioned several times. The fault crosses this cone just to the east of the summit, and has given the eastern slope of the mountain a steeper inclination than is shown by the western side. Northward from the Mammoth mine, the same line of faulting is continued for many miles, and shows a recent scarp all along the eastern border of Dog Valley. The fault-scarp that ascends the side of the volcanic cone, and also the recent scarp in Dog Valley, are the results of slight and very recent movements along an ancient line of profound displacement. The volcanic mountain southwest of Cove Creek has been built over this old line of fracture. The sulphur in the Mammoth mine has been deposited in the fissures made by the faulting of the strata, and in the seams and openings between the layers of limestone. The rock on the borders of these fissures, beneath the thin lining of sulphur, has been altered to a brown earthy mass, to the depth of about half an inch. The mines, like the Philadelphia and the Mammoth, that have been opened on lines of fracture in solid rock, show but little sulphur, and on the whole can not be considered as giving promise of any large deposit below the surface. In these mines also, the temperature is high, but not so great as at the Cleveland.

The beds of volcanic tufa in which the sulphur has been deposited probably rest on harder rock that has been fissured, thus allowing the sulphur-bearing vapors to escape upward, as in the case of the Philadelphia mine; but no section showing the tufa-beds above such fissures has been exposed. As these beds of tufa occur for many miles along the base of the mountains, we may hope that the conditions for charging them with sulphur have been many times repeated. Next to the Cleveland mine, we should certainly look to the beds of tufa, along the base of the mountains eastward of Cove Creek, for the principal supply of sulphur for economic purposes from this region. Owing to the exhalation of noxious gases in nearly all the prospects that have been opened, we find in the bottoms of the excavations large numbers of dead insects, together with the remains of mice, bats, rabbits, etc., that have been smothered by the escaping gases. In many of the openings, a choking sensation is felt, and the amount of gas, which seems to be largely carbonic acid, is so great that a person can remain in them but a few seconds. Even in shallow prospects, the workmen have to fan each other, in order to remain in the openings long enough to do their work. These mines can only be opened from the surface, and even by this method they can not be worked to any considerable depth, owing to the high temperature of some of the prospects and the constant escape of noxious gases.

Associated with the deposits of sulphur are beds of gypsum, and also irregular deposits of "alum." Just what the nature of this "alum" may be has not been determined by analysis. These beds usually overlie the sulphur deposits, the alum being sometimes two feet thick, and the gypsum as much as eight feet. Hot springs occur in the same field, which, together with the feeble fumerole at the top of the old crater, bear evidence of the expiring volcanic energy of the region.

SULPHUR DEPOSITS AT HUMBOLDT HOUSE, NEVADA.

The sulphur at this locality has been reported as occurring in nearly vertical fissures that are associated with recent basaltic buttes. Careful search was made by the writer, however, for fissures answering these conditions, while examining the surface geology of the Humboldt Valley, without successful results. The only sulphur deposits that could be found in the vicinity, and the only ones known to the people living at Humboldt House, occur in the craters of extinct hot springs. These craters are situated about half a mile southward of Humboldt House, on the open sage-brush desert, and rise to the hight of from twenty to fifty feet, as nearly as could be estimated. Nearly all of the cones are weathered and broken down, and all are extinct, the water now rising to the surface for miles around. The outer surface of the cones is composed of calcareous tufa and siliceous sinter, forming irregular imbricated sheets that slope away at a low angle from the orifice at the top. The interiors of these structures are filled with crystalline gypsum, that in at least two instances is impregnated with sulphur. One of the cones has been opened by a cut from the side in such a manner as to expose a good section of the material filling the interior, and a few tons of the sulphur and gypsum removed. The percentage of sulphur is small, and the economic importance of the deposit, as shown by the excavation already made, will not warrant the further expenditure of capital. The cone that has been opened is surrounded on all sides by a large deposit of calcareous and siliceous material, thus forming a low dome or crater, with a base many times as great in diameter as the hight of the deposit. These cones correspond in all their essential features with the structures that surround hot springs that are still active in various parts of the Great Basin, thus leaving no question as to their origin. They are situated within the basin of Lake Lahontan, and must have been formed and become extinct since the old lake evaporated away.

Sulphur is reported as occurring in the chemically formed deposits that surround Steamboat Springs, situated midway between Carson and Reno, Nevada. The conditions at these springs must be very similar to those that existed near Humboldt House, at the time the cones containing the sulphur were formed. Sulphur is also said to occur in the Sweetwater Mountains, situated on the boundary between California and Nevada, in latitude 38° 30′. The extent and geological relations of these deposits are unknown.

THE RABBIT-HOLE SULPHUR MINES.

These mines are located in Northwestern Nevada, on the eastern border of the Black Rock Desert, and derive their name from the Rabbit-Hole Springs, a few miles to the southward. The hills bordering the Black Rock Desert on the east are mainly of rhyolite, with a narrow band of volcanic tufa along the immediate edge of the desert. These beds of tufa are stratified and evidently water-lain, and are identical with tufa deposits that occur over an immense area in Oregon and Nevada. At the sulphur mines, the tufas contain angular fragments of volcanic rock and have been cemented by opal and other siliceous infiltrations since their deposition, so that they now form brittle siliceous rocks with pebbles and fragments of older rocks scattered through the mass. In many places, these porous tufas and breccias are richly charged with sulphur, which fills all the interstices of the rock and sometimes lines large cavities with layers of crystals five or six feet in thickness. In the Rabbit-Hole District, sulphur has been found in paying quantities for a distance of several miles along the border of the desert; but the distribution is irregular and uncertain, and is always superficial, so far as can be judged by the present openings. As in the Cove Creek mines, the sulphur at Rabbit-Hole has been derived from a deeply-seated source, and deposited from a vaporous condition in the cooler and higher rocks in which it is now found. Judging from the siliceous material that cements the tufas, it is evident that the porous rocks, in which the sulphur is now found, were penetrated by heated waters bearing silica in solution, previous to the deposition of the sulphur. These mines occur in a narrow north and south belt, along a line of ancient faulting which is one of the great structural features of the region. The association of faults with sulphur-bearing strata of tufa is here essentially the same as at the Cove Creek mines. At the Rabbit-Hole mines, however, no very recent movement of the ancient fault could be determined. This absence of a recent fault-scarp, together with the fact that the mines are now cold and do not give off exhalations of gas or vapor, shows that the solfataric action at this locality has long been extinct.

At all the localities visited, the sulphur has been derived from sources far beneath the surface, from which it has been expelled by heat and escaped upward through fissures that were formed along lines of faulting, and has been condensed on the sides of fissures and in the interspaces of the cooler rocks near the surface. Whether the deposition of sulphur took place by direct sublimation or by the decomposition of sulphureted hydrogen, has not been determined. The date at which the sulphur was introduced into the rocks where we now find it is in all cases very recent, and at the Cove Creek mines the action is still in progress.

Work at the Rabbit-Hole mines is now carried forward by a day-shift of seventeen men, the production of sulphur being about six tons per day. The value of the sulphur produced is about forty-five dollars per ton in San Francisco. The sulphur, after being mined and assorted, is placed in upright cast-iron retorts, having a general resemblance to the common form of blast-furnace, with a capacity of about two and a half tons. When the retorts are charged, the opening at the top through which the sulphur-bearing rock is introduced is closed, and superheated steam admitted at the side. The steam pressure is at first about seventy pounds to the square inch; but as the sulphur begins to melt, the pressure is allowed to subside to sixty or perhaps fifty pounds. When the sulphur melts, it passes through a grate and is collected in a kettle beneath the retort, from which it is allowed to flow, in a very liquid brown stream, into a receiving-pan with a capacity of about twelve thousand pounds, where impurities that were previously held in suspension are allowed to settle to the bottom. From the receiving-pan, the sulphur is run into molds shaped like the frustum of a cone, each of which has a capacity of from two hundred to two hundred and fifty pounds. When allowed to stand a few days after cooling, these cylindrical masses break into irregular lumps, in which condition the sulphur is delivered to the refinery at San Francisco.

MINING ACCIDENTS IN THE UNITED STATES.—An analysis of the mining accidents which occurred during 1881 in ten of the Western United States, shows, according to the London *Mining Journal*, that they were thus distributed: California, 116; Nevada, 62; Arizona, 12; Colorado, 7; Montana, 6; Idaho, 4; Dakota, 3; Oregon, 2; Utah, 2; Washington Territory, 1=225. These accidents resulted in the death (d.) of 176 persons; the serious injury (s.) of 68 others; and the slight injury (i.) of 75 persons. The distribution was: California, d. 72; s. 31; i. 32=135;

Digitized by Google

Nevada, d. 35; s. 28; i. 23=86; Arizona, d. 16; s. 7; i. 5=28; Colorado, d. 9; i. 4=18; Oregon, d. 5; i. 1=6; Montana, d. 8; s. 2=10; Dakota, d. 9; i. 8=17; Utah, d. 13; i. 1=14; Idaho, d. 8; i. 1=9; and Washington Territory, d. 1; giving the totals as above. These figures are given, and the various kinds of accidents have been placed in twenty-six classes by a gentleman in the office of Mr. del Mar, of San Francisco, and the compiler is certainly entitled to great credit for the elaborate way in which he has performed his somewhat laborious task. The cause of accident and the effect are thus distributed: Explosions and blasts, d. 28; s. 18; i. 23=69; falls (except 14 below), d. 30; s. 11; i. 12=53; cave in mine, d. 33; s. 13; i. 11=57; prostration by heat, and suffocation by heat, smoke, etc., d. 13; fire, d. 6; s. 2; i. 3=11; asphyxiated, d. 3; scalded by hot water, d. 1; s. 1; i. 1=3; poisonous water and air, d. 4; caught in or struck by machinery, d. 8; s. 5; i. 12=25; struck by cage or bucket. d. 1; s. 7=8; fall of cage or bucket (14), d. 1; struck by falling rock, tools, logs, etc., or pieces of quartz while working (4 classes), d. 12; s. 4; i. 6 =22; crushed by rolling boulders, between cars and side of shaft, or by rolling logs (4 classes), d. 7; s. 4; i. 1=12; run over by car d. 1; s. 1=2; washed through flume, d. 4; i. 2=6; land and snow-slides, d. 20; i. 3 =23, and reason of accident unknown, d. 4; s. 2; i. 1=7; total, d. 176; s. 68; i. 75; as stated above. It will be seen that caves in the mine produce the worst results, then falls, next explosions, and after these land and snow-slides. The author observes that, although the number of accidents chronicled here may seem very large, yet he does not think that more than one half of those which occurred in California and Nevada ever reach other than local papers, and that not more than two thirds reach even the local papers. As to the other States and territories which are referred to, it is only when any very exceptionally dangerous or curious accident has occurred that it is ever heard of so far away as San Francisco. This year, the papers have paid more attention to the item of mining accidents, but there is still great room for improvement.

GENERAL MINING NEWS.

ALASKA.

A dispatch states that a prospecting party, which started for the upper waters of the Yukon River some months ago, has discovered, 1500 miles up the Yukon, at the confluence of the Tananah River, rich and extensive gravel deposits, averaging $1.50 to the pan. The country is difficult of access, the Yukon being closed by ice until about June, while the trip overland from Sitka is as bad as a Siberian journey.

ARIZONA.

GILA COUNTY.

EXCURSION.—The company's mill on the east fork of the Verde River has stopped working. The reason is not given, but the stoppage is doubtless due to the difficulty of saving the gold.

CALIFORNIA.

MONO COUNTY—BODIE DISTRICT.

BODIE CONSOLIDATED.—During the week ended January 9th, 202 car-loads of ore were hoisted, 17 of which were from the 740-foot level of the shaft, and the remaining 185 loads from the workings below the 640-foot level. There were 113·9 tons of ore sent to the mill, and 127·733 tons were crushed. The average assay value of the pulp was $49.44 per ton, that of the sacked ore being $156.28, and the tailings averaged $6.24 per ton in value. The stopes on the rich vein show no important change, and the average value of the ore from the general stopes is somewhat higher for the past week. The north drift at the 800-foot level of the shaft was driven 10 feet, and is 233 feet in length.

STANDARD CONSOLIDATED.—During the past week, there were extracted and shipped to the mills 1419 tons of ore. The south drift from the east cross-cut, 700-foot level, is in 335 feet; progress, 13 feet, showing the vein to be 3 feet wide. The north drift from the west cross-cut has been driven 20 feet; total length, 264 feet, in a favorable formation. South drift No. 1, 500-foot level, is in 337 feet; progress, 17 feet. The vein at this point is 12 feet wide. The uprise from this drift has reached a hight of 218 feet. The vein is 10 feet wide. The north uprise has been advanced 12 feet; total length, 221 feet, where the vein shows an average width of 8 feet. South drift No. 1, 385-foot level, is in 429 feet; progress, 20 feet. The vein at this point is 14 feet wide. The winze in south drift No. 2 has reached a depth of 175 feet. The vein is 6 feet wide. The stopes show no change.

PLUMAS COUNTY—GREENVILLE DISTRICT.

The *Bulletin*, in speaking of the mines, says that there is not much to report. At the Cherokee, there have been several sales under attachments for labor and supplies furnished. The future of this mine and of the Gold Stripe is still uncertain; reports have been current several times of some one coming from New York, fully authorized by the directors to settle up the affairs of the mines with a view to resume operations, but no such person has yet appeared.

GREEN MOUNTAIN.—Both mills are running steadily, and the prospects at the mines are reported to be favorable.

MONITOR.—In the main tunnel, the character of the ore has improved lately; the ground is also considerably better for working.

PLUMAS CONSOLIDATED.—The work of opening up the mine continues.

TAYLOR-PLUMAS.—The mill is nearly completed. The ground in the lower tunnel of the mine is constantly improving.

SAN BERNARDINO COUNTY—PROVIDENCE MINING DISTRICT.

BONANZA KING.—The water troubles of this company at Providence have been settled by the purchase of the Water Jacket spring, and the company's ten-stamp mill (dry crusher) began steady work on January 1st.

ORIENTAL.—Work has been begun on a ten-stamp mill for this company at Calico.

COLORADO.

CLEAR CREEK COUNTY.

DIAMOND TUNNEL.—The rise on No. 8 has opened up a fine 12-inch vein of solid mineral, showing some gray copper. A drift has been started from the top of the rise. No. 5 is also showing good mineral in both the tunnel level and V level. 100 feet above.

SUMMIT TUNNEL AND MINING COMPANY.—The second annual meeting was held at the office of the company, in Idaho Springs, January 10th, 1883. The following directors were elected: George W. Chipman of Boston; Mons Anderson and B. B. Healy of Lacrosse, Wis.; A. M. Noxon, H. H. Newton, Peter Theobald, and C. L. Moe, of Idaho Springs, Colorado. The officers elected were: A. M. Noxon, President; B. B. Healy, Vice-President; C. L. Moe, Treasurer; George E. McClelland, Secretary; A. M. Noxon, Managing Director. It was voted to establish a branch office of the company at Lacrosse, Wisconsin.

GILPIN COUNTY.

HATTIE ANNIE.—At a recent meeting of this company, held in Central City, the following directors were elected for the ensuing year: Edward Ferris, Paul Beckwith, E. T. Ensign, S. N. Nye, A. Allen, R. C. Bristol, and Warren Libby. Out of this board of directors the following officers were chosen: Edward Ferris, President; S. N. Nye, Vice President; E. T. Ensign, Secretary; and Alfred Allen, Treasurer.

PALMS.—This company has let a contract for the driving of a cross-cut south from the working-shaft of the Galena mine, on Central City Hill, 30 feet. This cross-cut, it is thought, will strike a new vein, which was discovered in grading off for an office building for the company, south and adjoining the main building over the mine. Another contract has also been let for driving a drift east from the working-shaft on the Bugher mine. The latter lies north of the Galena, and is considered a parallel vein.

LAKE COUNTY.

Late Leadville exchanges contain the following:

AMIE.—The lessees of this mine are crowding on all the miners they can advantageously work in the new and rich ore-stopes opened by them. Two and a half months yet remain in which to extract ore under the present contract.

BIG CHIEF.—Work will be resumed in a week or ten days. As soon as the Clontarf and Brookland get to work pumping water, this mine will be enabled to work advantageously its large ore-bodies on the lower levels.

BUCKEYE.—Active preparations are in progress for the resumption of work on this lode, on the north side of Fryer Hill. A new shaft-house of commodious dimensions has been erected, and machinery is getting into position.

CHRYSOLITE.—The concentrating mill of this company has been closed down. A large mill will probably be erected early in the spring. The mill just closed down was only an experimental establishment, and too small to admit of running at a profit.

HIBERNIA.—These mines were sold January 12th, by the sheriff of Lake County, and were knocked down to the judgment creditor, Mr. Hiram S. Holly, of Denver. The property is purchased by Mr. Holly subject to the sheriff's certificate of purchase made last March, and which had never been redeemed by the old company. This sale places the Hibernia properties in the possession of Mr. Holly, without redemption or further recourse for other creditors or the new Hibernia Silver Mining Company, which was organized some months ago, to redeem the property of the Hibernia Consolidated Company.

IRON HILL CONSOLIDATED.—The new hoisting machinery is in running order, and shipments of ore will begin shortly. The extraction of ore has already begun. A contract for sinking a new shaft has also been let.

LONG & DERRY.—Work is pushed on a drift running into the hill from the foot of No. 5 shaft, which shows a fine breast of ore, running two hundred ounces to the ton. The most of the development-work done on these properties by the former owners was restricted to pits and open cuts near the surface. The rich deposits of ore in the limestone near the surface are, however, indicative of large bonanzas, at greater depth. Mr. Langhorne is at present engaged in sinking a new shaft, designated as No. 12 shaft, which has attained a depth of 140 feet. It is located near the western limits of the consolidation, and apparently has struck in the line of the break. So far, boulders of lime, iron, and galena have been encountered in this shaft, with increasing prospects as depth is attained.

MORNING STAR.—A hoisting-engine in the Waterloo incline, to facilitate the sinking of an underground shaft or winze, has been put up.

OURAY COUNTY.

The placer mines down the river at the mouth of the Dallas are busily engaged in making preparations for an active season's work. Operations will begin as early as the season will admit.

SUMMIT COUNTY.

The output of this county, from the sources named, appears to have been as follows for the year 1882:

Robinson ore	$315,000
Kokomo ore	470,400
Kokomo bullion	237,952
Northeast end county, silver ore and bullion	459,550
Northeast end county, gold	50,800
Red Cliff ore	312,139
Red Cliff bullion	45,450
Gold Park bullion	70,000
Taylor Hill bullion	50,000
Total for Summit County	$2,011,291

DAKOTA.

FATHER DE SMET.—The superintendent reports, under date of January 4th, as follows: Herewith express company's receipt for bar No. 150, containing 1589.85 ounces gold, the result of run of mill for last half of December. As any drafts for December expenses will be about as they were last month, we shall make a very fine showing for the month, with a prospect of a continuance for a number of months at least. The mine is producing good ore at all points. The mill is doing first-rate work. Water, wood, and ore in abundance. We close the year without owing a dollar to any party for labor, supplies, etc., except current bills for the month of December, which are light.

IDAHO.

SAWTOOTH DISTRICT.

A correspondent of the Salt Lake *Tribune* reports on some of the mines of this district as follows:

NELLIE.—Of this group of mines, the Nellie is the best developed. In the lower tunnel, 300 feet from the apex of the ledge, the vein is five feet in width, and carries a great deal of ruby and wire silver. The owners of the Nellie group intend to build a ten-stamp mill next season.

SILVER KING.—This mine is situated on Beaver Creek, near the Pilgrim mine. The ledge is twelve feet or over in width, and has been stripped sixty feet and worked to a depth of twenty-eight feet. The quartz is said to be the richest for the size of the vein yet found in the Sawtooth District, and is so soft that no powder is needed to break it. The first class ore assays over $4000; second class, from $750 to $800; third class, from $90 to $120.

SOLACE.—The original Solace vein is over four feet in width, nearly half of which is extremely high grade. In running a tunnel to strike the main ledge last winter, a new vein, about 100 feet north of the Solace, was struck at a depth of 120 feet, with one or two feet of ore containing from $450 to $800 in silver. This company owns a number of ledges in Smiley Basin, and when they are sufficiently developed, a ten-stamp mill is to be erected.

VIENNA.—This is a consolidation of the Vienna and Mountain King mining companies, incorporated last winter at La Crosse, Wis. This summer, the company shipped from Chicago the machinery for a 20-stamp silver mill, built by Fraser & Chalmers. The building is completed and the machinery in place, and crushing will begin early in the spring. The snows and rains of September and October prevented the arrival of sufficient supplies of salt, quicksilver, etc., otherwise the mill could have started up by the 1st of January. The Mountain King mine is from twelve to twenty feet in width, and averages about $100 per ton. The vein is opened for a distance of 500 feet, and is over 200 feet from the surface at the deepest point in the main tunnel. The ore is ruby, sulphurets, and antimonial silver, carrying with the silver from half an ounce to an ounce of gold per ton. The Vienna mine is worked to a depth of 300 feet, and the different stopes and levels show abundantly of good ore. The vein is from two to five feet in width, and has been traced a distance of 1500 feet, showing the same character of ore the whole of that distance. The quartz is generally good, the first-class sampling all the way from $250 to $3000 per ton, and the whole of the vein averages well. The Alturas, Justice, Oregon, and other mines of the company (about one dozen, in all) contain fine ore and much of it.

Digitized by Google

MICHIGAN.

The Houghton *Mining Gazette*, in a review of the mines of Lake Superior Mining District, says that the business career of the prominent copper mines of the district for the past twelve months has been exceedingly satisfactory, and that the outlook for 1883 promises to be even more gratifying in material results when the record of the year is brought to a close.

CALUMET & HECLA.—During the past year, this company purchased the very valuable property, carrying the dip of its conglomerate belt at a point on the south end of the mine, known as the Frue-Loring tracts. This addition to the already apparently inexhaustible metalliferous territory within the limits of the boundaries of the corporation's possessions indicates the capabilities of the Calumet & Hecla as furnisher of copper, if put to the test. During the past year, a vast amount of work has been done in connection with the hoisting machinery, etc., on the mine, and the stamp-mills at Torch Lake. At the latter place, pumping machinery, elaborate and durable in character, has been erected with a capacity for supplying every twenty-four hours the enormous quantity of 40,000,000 gallons of water, an amount ample to meet all demands in the future in connection with the operation of dressing mineral. Other important improvements in the direction of economy and efficiency in union with the mine works and stamp-mills will be completed during the coming year.

QUINCY.—During the past year, many necessary improvements and additions were made to the surface plant of the mine. The production for 1882 was 3471 tons, the largest ever afforded by the mines.

OSCEOLA.—The transfer during the year of hoisting machinery, etc., from the old or Conglomerate mine to the new mine on the Osceola lode, interfered to some extent with the production of the industry. The surface department, including dressing-mill, is in excellent shape, and will require but few expenditures outside of necessary repairs, for some time to come. The underground part of the works is abreast with the other portion of the mine.

FRANKLIN.—The mine starts out on its new business year well equipped, both underground and on the surface.

TAMARACK.—The vertical shaft on this mine is down several hundred feet, and has already cut one copper deposit of promise, and within the next four months it is expected the Allouez conglomerate will be encountered. The permanent hoisting, pumping, and general surface working plant of the Tamarack is now in place.

NEVADA.

ARGENTA.—At the annual meeting, held at San Francisco January 8th, the following directors were elected: J. L. Browne, President; Thomas Cole, Vice-President; George Congdon, W. H. King, E. M. Hall. E. M. Hall was elected Secretary, John E. Dixon, Superintendent Bank of California, Treasurer. The secretary reported receipts from assessments, $75,000; other sources, $1582.58; total receipts, $76,582.58. The disbursements amounted to $76,288.57, leaving a cash balance on hand of $294.01. The superintendent says that, in order to develop the Argenta mine at the least expense, it is necessary to work the 600, 700, and lower levels through the Grand Prize shaft, which can be done by paying half the cost of running it; and as there are good indications of a body of ore below the 600 level, the Argenta will take advantage of this proposition. The Argenta hoisting-works are valued at $18.600.

NEW MEXICO.

The Albuquerque *Journal* says that a miner's union has been organized in the Black Range. Members of it are requested to sign the following pledge: "That we, the miners of the Black Range, pledge ourselves to work underground for a no less compensation than four dollars per day." Miners of the Apache, Cuchillo Negro, and Limestone districts are invited to join.

BRADLEY & DORSEY GROUP.—The superintendent reports that a large body of free-milling ore, carrying horn-silver in good quantities, has been struck.

MOUNTAINEER.—A half-interest of this entirely undeveloped mine was recently sold at Albuquerque for $1000.

NORDHAUSEN.—Assessment-work has been commenced on this claim, and, at a foot or two from the surface, chunks of lead and antimony-bearing silver began to appear, imbedded in the quartz and soft gouge matter which occupied the whole width of the shaft. Most of the mineral has the form of hard carbonates. Assays have not yet been made.

UTAH.

SAMPSON.—The manager of this property, Mr. Van Praag, sunk a shaft to the depth of 200 feet, when a four-foot vein was struck. Ore is scattered through this vein, there being several small streaks, aggregating about six inches of rich ore. At a point 600 feet east of this shaft, an incline was run in and steam hoisting-works placed over the mouth of the incline. In this incline, the vein was cut a few days ago, and drifting has been done to the amount of about twenty-five feet.

WYOMING.

The new mill at Cummins City is all ready to fire up—all the machinery in place, and the building complete. It will run ten stamps, and will be put to work.

Messrs. Burnham & Hudson are making preparations for increasing the power of their five-stamp mill to twenty stamps.

TIE SIDING.—Mr. Le Roy Grant has sold his half-interest in this copper mine to a Welsh company, which proposes to develop it. It has already commenced work at the shaft.

ANNUAL FINANCIAL STATEMENTS.

Annual statements of the financial condition of different mining companies incorporated in this State are now published according to law, and we glean from them the following figures, which may prove valuable and interesting reading. The statements are generally so framed that the amounts given as indebtedness are estimated to be the maximum. They do not profess to be, in most cases, an accurate summary of outstanding debts:

	Indebtedness.	Reporting Officer.
Arizona Queen Gold Mining Company...	$6,703.00....	Robert B. Gilman, President.
Auraria Gold Mining Company.....	6,386.84....	J. H. George, Secretary.
Bye-and-Bye Gold Mining Company.....	5,000.00....	Peter Bodine, Secretary.
Central Arizona Mining Company	50,000.00....	J. M. Seymour, President.
Consolidated Bobtail Gold Mining Company	11,000.00....	John Stanton, Secretary.
Crooke Mining and Smelting Company....	500,000.00....	Lewis Crooke, Secretary.
El Oro Mining Company.....	400,000.00....	Benjamin F. Guyton, Sec'y.
Hall-Anderson Gold Mining Company.....	2,277.58....	H. R. Kretschmar, Secretary.
Mineral Point Tunnel Company.....	100,000.00....	E. Salomon, Secretary.
New York & San Jorje Hydraulic Gold Mining Company.....	63,843.00....	A. F. Pruyn, President.
North Star Mining and Smelting Company.	5,000.00....	Lewis Crooke, Secretary.
Pierce Gold Mining Company.....	15,000.00....	Benjamin F. Guyton, Sec'y.
Southern Eureka Mining Company.....	10,000.00....	Peter Bodine, Secretary.
South Horn-Silver Mining Company.....	5,000.00....	Henry Bradstreet, Secretary.
South Pacific Mining Company.....	15,000.00....	James F. Oliver, President.
Utah Consolidated Silver and Gold Mining Company.....	275.00....	M. P. O'Hern, President.
Willshire Hydraulic Gold Mining Company.	6,000.00....	M. J. Waters, Secretary.

FINANCIAL.

Gold and Silver Stocks.

NEW YORK, Friday Evening, Jan. 19.

The better feeling at the Mining Exchanges recorded last week has continued and a very active business has been done at good prices. There is nothing of special interest to report, as the market is fully covered by the summary below. The Comstock shares have been weak and quiet, while the Leadville stocks record an active business at strong prices. The Tuscaroras continue strong, but have been rather quiet. There are several low-priced stocks which have been very active and quite strong. The sales of mining shares at all the Exchanges aggregate 606,100 shares, against 585,555 last week.

The Comstock shares have been very quiet at about steady prices. California was quiet and steady, selling from 24@20@21c. Consolidated Virginia records a very moderate business at irregular prices; it sold from 45@53@46c. Union Consolidated sold at $2.75 and Mexican at $2.50. Ophir was dealt in to the extent of 235 shares at $2.90@$2 35. Consolidated Imperial was quiet and steady at 3@2c. Hale & Norcross sold at $1. Savage sold from 70@75c. with a business of 200 shares. Yellow Jacket was very quiet at $1⅛. Best & Belcher sold at $3¾. Sutro Tunnel had an active business and was steady, selling from 21@25@23c.

The Leadville stocks were moderately active and were strong. Amie records an active business at strong prices, selling from 18@24@19c. Chrysolite was also strong, under moderate transactions, selling from $1.35@$1.55@$1.50. Hibernia was quiet and strong at 2@9@6c. Iron Silver records a moderate business at strong prices; it sold from $2.45@$2.55. Leadville was very quiet, and was held firmly at 65@70@68c. Little Chief records a very active business at strong prices; it sold from 39@45c. Little Pittsburg had a moderate business, and was also strong, selling from 63@77@72c. Big Pittsburg has declined from its recent strong prices, and has sold this week from 29@19c. with a very active business. Climax had a fair business at steady prices, selling at 8@10c.

The Bodie stocks were very quiet at steady prices. Bodie Consolidated sold from $1.88@$2.25. Standard records but two small transactions at $6½. Bulwer has been quiet and a little weak, selling from 93@90c. Goodshaw sold from 6@8c.

The Tuscarora stocks had a moderate business at strong prices, Grand Prize sold from 28@50c., with a moderate business. Tuscarora was quiet and strong, selling from 14@28c. Belle Isle records a fair business at strong prices; it sold from 90c@$1.10@95c. Navajo was strong at $9⅝@$9½@$8¾@$9. Independence was very quiet at strong prices, selling from 65@70c. North Belle Isle records a business of 1000 shares at 60@72c.

In the miscellaneous list, Alice has had a fair business at strong prices; it sold from $2.05@$2.45@$2.40. Eureka Consolidated has been strong, selling from $10.75@$11.25. Findley has had a fair business at irregular prices, selling from 9@6@8c. The Green Mountain stocks have been very quiet at weak prices. Gold Stripe sold at 9@7c.; Green Mountain, at 50@49c.; Rising Sun, at 10@7c.; and Cherokee, at 11@6c. Hall-Anderson has been a little weak, under a moderate business, and sold from $1.85@$1.70. Horn-Silver records a moderate business at strong prices; it sold from $6¼@$7½. Hukill has been very active but somewhat weak; it sold from 27@16c. Robinson Consolidated records a very active business at irregular prices, selling at $1.30@$1.20@$1.25. Sierra Grande continues to be very active, but has been very irregular; it sold from $3@$2.40@$2.45.

Albion has been quiet and weak, selling from $1.75@$1.25. Alta-Montana has suffered a decline this week, under a small business, and has sold from 22@18c. Barcelona has been active and steady at 23@24c. Bradshaw has been quiet and steady, selling from 39@37c. Decatur continues to do a very large business at steady prices, selling from 8@9c. Fannie Barret has had a moderate business on the American Board at strong prices, selling from $2.10@$2.25@$2.20. Oriental & Miller has been very active at irregular prices; it sold from 12@20@15c. Silver Cliff has been quiet and irregular, selling from 36@41@39c. South Pacific has been active and steady at 8@9c. The State Line stocks record a fair business at steady prices; Nos. 1 and 4 sold from 4@3c., and Nos. 2 and 3 at 7@8c. Taylor-Plumas has been very active on the American Board at about steady prices; it sold from 22@18@20c.

PIPE LINE CERTIFICATES.

Below will be found the daily quotations and sales for the past week at the New York Mining Stock Exchange. The highest quotation for the week was 92⅛c., and the lowest 88½c. The market has been very quiet:

	Highest.	Lowest.	Sales.

" 19.....	89½	88½	79,000
Total sales.....			559,600

The property of the old Silver Nugget Company has been sold to the Consolidated Silver Nugget Mill and Mining Company, which starts entirely free from debt and with ample working capital. It also controls, by lease at $500 per month, a mill. Stockholders in the old company have the privilege of turning into the new company's office (Room 62, Drexel Building) their stock, and by the payment of 25 cents per share secure stock in the new company.

DIVIDENDS.

The Contention Consolidated Mining Company, of Arizona, has declared its regular monthly dividend (No. 12) of 25 cents per share, payable January 29th, at the office of the Farmers' Loan and Trust Company, on all stock registered in New York. Transfer-books close on January 18th.

The Father de Smet Consolidated Gold Mining Company, of Dakota, has declared a dividend (No. 25) of 20 cents per share, payable at the office of Laidlaw & Co., No. 14 Wall street, on January 31st. Transfer-books will close on January 20th.

The Horn-Silver Mining Company, of Utah, has declared a quarterly dividend (No. 8) of $300,000, being three per cent on the capital stock, payable February 15th. Transfer-books close on February 7th, and reopen February 16th.

The Kentuck Mining Company, of Nevada, has declared a dividend of ten cents per share.

The Northern Belle Mining Company, of Nevada, has declared a dividend of fifty cents per share.

The Paradise Valley Mining Company has declared a dividend of five cents per share, payable at San Francisco.

REVIEW OF THE SAN FRANCISCO MARKET.

The San Francisco market has been more active this week than usual. The Comstock shares have had a good share of the business, but at lower prices. News from the mines states that there is a marked decrease of water in the North End mines, and that the 2700-foot level is nearly dry. The Tuscarora stocks continue strong under a small business. It is stated that the shaft at Navajo is sinking below the 450-foot level, and that the drifts at the lower level show good quality of ore. Telegraphic dispatches state that considerable excitement in the mining market has been caused by the disappearance of D. B. Chisholm, Secretary of the Albion and several other mining companies, and it is said that large operations in Albion and an over-issue of stock have been the cause of his flight. Under these reports, Albion was quite active at weak prices.

Copper and Silver Stocks.

Reported by C. H. Smith, 15 Congress street, Boston, Stock Broker and Member of the Boston Mining and Stock Exchanges.

BOSTON, Jan. 18.

The market for copper stocks the past week has been fairly active at generally lower prices, especially in Quincy, which has declined from $63@$59 on sales of small lots. We hear no special reason assigned for the decline, unless it be found in the fact that as yet no dividend has been declared, as expected, and a slight falling off in the product for the past year. Calumet & Hecla sold ex-dividend at $245, a decline of $1 from last week's sales. There is, however, but little stock offered, and ready purchasers are at hand for the lots as they come on the market. Franklin also declined from $15¾@$15. Pewabic sold as before at $10. Osceola has been more active, but lower and declined from $33@$31½. Huron sold at $2, but later declined to $1¾. National sold also at $1¾, against $1⅞ last week. Brunswick Antimony declined from $15@$14⅜.

In silver stocks, Catalpa and Crescent have been most active. The former, on the good showing from the mine, advanced from 75c.@$1.10, with sales of several thousand shares; and the latter, in sympathy with its companion, also advanced from 30@42½c.; both stocks, however, later declined, the former to $1 and the latter to 40c. Bonanza was steady at $2⅜, but dull. Silver Islet declined from $7⅛@$7. Sullivan advanced to $1⅛ on sale of 500 shares in one lot, but later declined to $1. San Pedro advanced from 35@42½c.

At the Mining Exchange, Empire steady at 30c.; Deer Isle, 12@14c. Massachusetts & New Mexico advanced to 24c., and in good demand. Quite a business has been transacted in Pipe Line certificates, at 90@92½c.; Twin Lead at 25@28c. The Water Meter stocks are steady at about 50@60c. for New England, and 60@65c. for Standard.

3 P.M.—The market this afternoon was active, with sales of Bonanza at $2 7-16@$2¼; Calumet & Hecla, at $245½, Catalpa, 95c. Pewabic sold at $9, which was also bid for it at close; Quincy at $61, closing $60½ bid. Huron sold at $1 13-16. Osceola offered at $32. Atlantic, $16 bid, $17 asked. Allouez, $2½@$3. Franklin, $15½ asked. Silver Islet, $5½@$7. Pedro sold at 42½@40c., and offered at the latter price. Napa Quicksilver, $3¼ sales and bid. Brunswick Antimony, $14 bid.

BULLION MARKET.

NEW YORK, Friday Evening, Jan. 19.

The market has been more steady the past week than since the recent decline began, and may be considered firm at the rates of the accompanying table.

DATE.	London Pence.	N. Y. Cents.	DATE.	London Pence.	N. Y. Cents.
Jan. 13	50⅛	109	Jan. 17	50⅛	109⅛
Jan. 15	50⅛	*	Jan. 18	50⅛	109¼
Jan. 16	50⅛	109	Jan. 19	†	109⅜

* 108⅞@109. † 50 3-16

If the government should limit the coinage of the

Digitized by Google

standard dollar, as proposed by the Coinage Committee of the House, there would be, doubtless, a decline of five or ten cents an ounce in silver.

BULLION PRODUCTION FOR 1882.

We give below a statement showing the latest bullion shipments. These are officially obtained from the companies, where that is possible; and where official statements can not be procured, we take the latest shipments published in those papers nearest to the mines reported. The table gives the amount shipped for the week up to the date given, as well as the aggregate shipments to such date from the first of January, 1882.

The shipments of silver bullion are valued at $1.29·29 per ounce troy; gold at the standard $20.67 per ounce troy. The actual value of the silver in the following table is therefore subject to a discount, depending on the market price of silver. If the price of silver be counted at $1.12 an ounce, which has for some months been about its average value, the following figures, where they relate to silver bullion, should be diminished by about 13½ per cent, to arrive at actual value.

Foreign Bank Statement.—The governors of the Bank of England, at their weekly meeting, made no change in the bank's minimum rate for discount, and it remains at 5 per cent. During the week, the bank gained £637,000 bullion, and the proportion of its reserve to its liabilities was raised from 37 11-16 to 40⅝ per cent against 37 11-16 per cent at this date last year. The weekly statement of the Bank of France shows a gain of 2,000,000 francs gold and a loss of 112,500 francs silver. The Imperial Bank of Germany reduced its rate for discount from 5 to 4 per cent, and during the week gained 19,660,000 marks in specie.

Bullion Receipts at New York.—The bullion received from the mines at the various offices in this city during the week ended January 19th, as compiled from various sources, amounted to $251,836.94, as against $374,877 reported for the previous week. The receipts from January 1st, 1883, to date, are $1,123,293.81.

IRON MARKET REVIEW.

NEW YORK, Friday Evening, Jan. 19.

American Pig.—The feeling of uncertainty continues, and the market is consequently dull and featureless. We quote at tidewater as follows, with the market in buyers' favor: Standard to choice Foundry No. 1, $24.50@$26; No. 2, $22.50@$23; and $20.50@$21, for Gray Forge. At the close of last week, 10,000 tons of Bessemer pig, foreign, were sold at private terms; since then, holders are firmer, asking $22.75@$23, which does not meet buyers' views. England cables 55s. Spiegeleisen is quiet at $33@$34, for 20 per cent; $30 for 15 per cent; and $27.50@$28 for 10@12 per cent.

Scotch Pig.—The market is exceedingly dull, and we have very little new business to report. Nominally, quotations are a little lower, but it is probable that better conditions could be obtained by good buyers for good lots. We quote Coltness, $25@$25.50; Summerlee, $23@$23.50; Glengarnock, $22.50@$23; and Eglinton, $21@$21.50. At the Wall Street Exchange, the cables are to-day a trifle lower: Carnbroe, 55s 3d.; Gartsherrie, 63s. 6d.; Summerlee, 62s.; Coltness and Langloan, 66s. 6d.; Glengarnock, 55s.; and Eglinton, 50s. 3d. Warrants are 48s. 4d.

Steel Rails.—Beyond a few sales of small lots, aggregating about 15,000 tons, for spring and summer delivery, nothing has been done. Makers are firm, and have no difficulty in getting $40 at mill.

Old Rails.—There is little interest, and very limited business. We quote Ts $23.50@$24.

Scrap.—Transactions are on a small scale, and prices are low. We quote: $24.50@$25 ex ship, for No. 1.

Philadelphia. Jan. 19.

Interest is still centered at Washington, though not a few manufacturers have discounted probable legislation, satisfactorily to themselves, at least. Business is quiet, and both makers and buyers are awaiting with much concern the action of Congress. Every thing has been done that can be to secure the Tariff Commission rates, and either these or nothing will be had. The iron interests are in earnest and mean business. The active members here and elsewhere think the iron interests will save themselves either in the House bill or by delay.

Pig-Iron.—The business of the week has been of a retail character in most cases. A few good-sized contracts have been entered into for special and standard brands of iron, which will not fluctuate much in any event. Quotations given to-day by large producers are $25@$26.50 for ordinary to best Foundry, $23@$23.50 for No. 2 iron, and $20@$21.50 for Gray Forge. Bessemer is somewhat unsettled by special ocean freight rates and by fluctuations at foreign furnaces. Buyers are in the way of providing for future requirements, and terms have been made which will lead to business.

Charcoal Blooms are in fair demand at $65@$67 and anthracite at $55@$56. Muck bars have been neglected, though sales have been made between $38@$39. The tendency is to lower prices, and offers have been made under $38, which will be taken, though the iron is not the best.

Merchant Iron has been selling very quietly at $2.25@$2.40, according to make and date of delivery. Neither makers nor buyers care to do business far ahead, as one side looks for lower prices and the other side better figures. Consumers would before this have bought freely but for tariff agitation. They have very little iron on hand. Makers believe business will improve as soon as the uncertainties are removed. If capacity were run to utmost limits, demand would soon be overtaken, and hence a conservative sentiment prevails. Country mills manage to keep busy, and stores are doing a fair retail trade. Prices are firmly held for the best makes of refined.

Nails are a little firmer for car-load lots, and factories are generally running full. An active spring trade is anticipated, and makers will prepare for it with a large assortment. Business for the week has been done at $3.30@$3.40.

Sheet-Iron is under better inquiry, and thin sheets are selling in small orders for early delivery. Quotations have departed from card rates for large lots, but buyers think the chances in their favor for easier prices from this out.

Shapes.—Structural shapes are in moderate request. Prices are weak and fluctuating. Large orders would be taken considerably under card rates. Buyers are waiting rather for bottom prices than for lower prices.

Tank Iron sold this week at $2.50@$2.60. A few inquiries have come to hand for spring requirements. Competition is active, and the market is in buyers' favor.

Steel Rails.—Birmingham mills have done a fair week's business in large and small orders at $39@$42. Considerable business is to be had. There is less competition than in December, and makers are trying to tone up prices.

Old Rails.—Transactions have been made for spring delivery at $25@$28.50. Ocean freights are favorable, and negotiations are in hand for several lots, which will be placed as soon as one or two uncertainties are removed.

Scrap.—Sales from yard in small lots were made at

Digitized by Google

$26 for medium to $27@$28 for No. 1. Cast, $19. Crop Ends, dull.

METALS.

NEW YORK, Friday Evening, Jan. 19.

Copper.—The market during the week has relapsed into quietness. We hear of no transactions of magnitude either in Lake or in other coppers, which are slightly lower, 17⅞c. being asked for Baltimore, and 17c. bid with hesitation. Lake is quoted 18⅛@18¼c. nominally. London cables to-day £72@£72 5s. for Best Selected and £67@£67 5s. for Chili Bars.

Lead.—Here, this metal was stagnant, nothing but ordinary amount of jobbing sales being recorded. Our Western dispatch will be found of more interest. Common lead is now nominally quoted 4·65@4·70c., and Refined 4·75c.

Messrs. John Wahl & Co., of St. Louis, wire us as follows to-day:

The market is very steady at some advances on last week's quotations, with a good demand. Sales for the week sum up over 300 tons of Refined at 4·35c., and 100 tons Hard lead at 4·30c.

Tin.—We hear of no transactions of magnitude, and the market is quiet, with a weakening tendency. We quote spot Straits nominally 21¼@21⅜c. London cables to-day £93 12s.

Spelter.—The market is exceedingly dull and quiet, with no features worthy of special mention. We quote Domestic 4⅝@4¾c., with Foreign entirely nominal. London cables £16 5s.@£16 10s.

Antimony.—With free arrivals and a light demand, the weakness continues, particularly as regards Cookson's, which we quote 11¼c., while Hallett's is 10·30c.

Quicksilver.—The spot price declined to 34½c. on receipt of the London quotation of £5 10s. per bottle.—*San Francisco Commercial Herald.*

COAL TRADE REVIEW.

NEW YORK, Friday Evening, Jan. 19.

Anthracite.

The announcement made on Monday that the companies had decided to restrict, stopping work three days in the week, for an indefinite period, has apparently put an end to the low prices at which buyers were able to get coal in some quarters. There has been considerable "shopping" since, and a little more buying; but the business is still limited, because purchasers seem unwilling to take coal except at the cut figures of the past week. Local stocks in yard are running lower, and there is a little more inquiry for the covering of immediate wants. It will take some weeks probably before the accumulations in the hands of the companies are removed and the reduced output begins to tell.

The production of anthracite for the week ended January 13th was 570,084 tons, as compared with 490,734 tons the previous week, and 584,014 tons for the corresponding week of 1882. The total product from January 1st to January 13th was 990,793 tons, as against 956,094 tons for the like period of last year, showing an increase this year of 34,699 tons.

Mr. John H. Jones has just published the following statement of anthracite coal tonnage for the year:

	For year 1882.	For year 1881.	Difference.
Phila. & Read. RR.	7,000,113	6,940,283	*59,829
Lehigh Valley RR.	5,933,739	5,721,869	*211,870
Central RR. of N. J.	4,211,052	4,085,423	*125,628
Del., Lack. & W. RR.	4,638,717	4,388,968	*249,748
Del. & Hud. Canal Co.	3,203,168	3,211,496	†8,328
Pennsylvania RR.	2,332,973	2,211,363	*121,610
Pennsylvania Coal Co.	1,469,820	1,475,380	†5,559
N. Y., L. E. & W. RR.	330,516	465,230	†134,719
Total	29,120,096	28,500,016	*620,079

* Increase. † Decrease.

The stock of coal on hand at tide-water shipping points, December 31st, 1882, was 562,116 tons; on November 30th, 535,891 tons; increase, 26,225 tons. The amount on hand December 31st, 1881, was 497,024 tons. Of the total production of 1882, 13,971,371 tons, or 47·98 per cent, was from the Wyoming Region; 5,689,437 tons, or 19·54 per cent, from Lehigh Region; and 9,459,288 tons, or 32·48 per cent, from Schuylkill Region. Competitive tonnage, including all coal which, for final consumption or in transit, reaches any point on Hudson River or the Bay of New York, or which passes out of the Capes of the Delaware:

1881..... 12,169,030 tons.
1882..... 12,018,764 "

Bituminous.

Business is fair for the season, and there are indications that the lots pressing for sale a week ago are disappearing. We quote unchanged, alongside, Clearfield, $4.60@$4.75, and Cumberland, $4.65@$4.85, according to quality.

Our attention has been called to a growing abuse, which consumers should take good care to avoid. A number of dealers have been flooding the country with carefully-worded circulars, in which they style themselves "miners and shippers" of George's Creek Cumberland coal. These parties do not mine a pound of that coal, and there is good reason to believe that they fraudulently assume a title to which they have no right, in order to be able to market inferior coals, as some consumers have already discovered to their loss. This game is not only hurtful to consumers, but is also injurious to the good reputation of Cumberland coal. Buyers may at once detect these parties by finding them unrepresented in the following list, which comprises all the miners of Cumberland coal. All others so styling themselves are frauds:

Borden Mining Co., Consolidation Coal Co., Blaen Avon Coal Co., Hampshire & Baltimore Co., George's Creek Coal and Iron Co., New Central Coal Co., Atlantic & G. C. Co., Piedmont Coal and Iron Co., Swanton Mining Co., Potomac Coal Co., Maryland Union C. Co., American Coal Co., Maryland Coal Co.

STATISTICS OF COAL PRODUCTION.

Comparative statement of the production of anthracite coal for the week ended January 13th, and year from January 1st:

Horsford's Acid Phosphate
For Wakefulness.

DR. WM. P. CLOTHIER, Buffalo, N. Y., says: "I prescribed it for a Catholic priest, who was a hard student, for wakefulness, extreme nervousness, etc., and he reports it has been of great benefit to him."

PATENTS.

SECURED and **SOLD** in all countries. Partners procured, Joint Stock Companies organized. 52 page "Inventor's Handbook" free, giving patent laws of all countries and full information how to procure, sell, develope or secure capital on patents. **E. L. RICHARDS & CO. 814 B'way, N.Y.**

ANNUAL REPORT OF THE "ARIZONA QUEEN GOLD MINING CO."

The capital stock of the company is $1,000,000. No part of which has been paid in cash, but all of it was issued in payment for the property necessary for the business of the company.

Amount of existing debts does not exceed $6703.

Dated New York January 15th, 1883.

ROBERT B. GILMAN, President and Trustee.
EDWARD M. CLARK, Trustee.
ERNEST MERINGTON, Trustee.

City and County of New York, ss.:

Robert B. Gilman, being duly sworn, says that he is the President of the Company, and that the above report of the trustees is true to the best of his knowledge and belief.

Sworn to before me on this 15th day of January, A.D. 1883. W. S. WOLF, Notary Public. N. Y. County.

DIVIDENDS.

NEW YORK, Jan. 12, 1883.

THE CONTENTION CONSOLIDATED MINING COMPANY this day declared its regular monthly Dividend, No. 12, of

TWENTY-FIVE CENTS PER SHARE,

payable January 28th, 1883, at the office of the Farmers' Loan and Trust Company, No. 26 Exchange Place, on all stock registered in New York. Transfer-books close on January 18th.

W. HART SMITH, Vice-President.

HORN-SILVER MINING COMPANY.
Office, 44 Wall Street,
NEW YORK, Jan. 15, 1883.

DIVIDEND No. 8.

A quarterly dividend of $300,000 has been this day declared, being three per cent on the capital stock, payable to stockholders of record on the 15th day of February next, at the office of the company.

Transfer-books will be closed on February 7th, and reopened February 16th. W. S. HOYT, Secretary.

SAN FRANCISCO, Jan. 15, 1883.

THE FATHER DE SMET CONSOLIDATED GOLD MINING COMPANY has declared Dividend No. 25, of Twenty Cents per share, payable at the office of Laidlaw & Co., 14 Wall Street, New York, on the 31st inst. Transfer-books will close 20th inst.

H. DEAS, Secretary.

MR. RICHARD P. ROTHWELL has returned from Europe. All personal communications should be addressed to this office.

THROUGH an oversight, we did the Judson Powder Company a serious injustice in stating that 29,000 *tons* of its powder had displaced 100,000 tons of rock in the great blast at the Glendon Iron Company's limestone quarries. It should have been 29,000 *pounds* of powder to 130,000 tons of rock. We must plead guilty to the error, and can only account for its passing undetected by the uneasiness which a fire in immediate proximity to our printing-rooms naturally created.

THROUGH a misunderstanding of the return in regard to the production of refined copper of the Quincy mine, Lake Superior, we have credited it with a greater yield than it has really made. We understood the figures sent us, 5,665,796 pounds, to be the yield for eleven months ending November 30th, and having at hand the amount of mineral produced in December, estimated the return of ingot copper on the same basis, thus reaching 6,500,000. In reality, as Mr. W. R. TODD, treasurer of the company, promptly informs us, this was for twelve months ending November 30th. He has kindly furnished us now with the actual product of the year 1882, since received, making it 5,682,663 pounds. This reduces the output of Lake copper, as given by our estimate last week, by 817,337 pounds, making it 56,590,446 pounds.

BOTH the Senate and the House of Representatives have at last reached the tariff bills, and the former has already got far enough to consider some of the most important parts of the metal schedule. The Senate resisted all efforts to place the duty on iron ore higher than 50 cents, which must have much grieved Senator MAHONE, who, by some curious process of reasoning, arrived at the conclusion that the "equitable, proportionate duty on iron ore would be at least $1.89 per ton," and for safety's sake, we presume, asked for $2 per ton. In reference to pyrites, a resolution was passed making the duty on all ores containing less than 3½ per cent of copper 50 cents, with an additional rate of 2½ cents per pound on the copper in all ores running higher than 3½ per cent—a provision which would make the copper in the bulk of the foreign pyrites used for sulphuric acid manufacture free.

The Senate has apparently very much hurt the feelings of the pig-iron men by adhering to the $6 per ton duty. Bessemer and open-hearth steel, ingots, blooms, and slabs have undergone a classification and partially also a reduction, a strong discrimination being made between the higher and the lower grades. For steel not exceeding in value two cents per pound, the duty is placed at 0·5 cent per pound ; for grades ranging in value between two and five cents per pound, one cent per pound. Steel rails weighing more than 25 pounds to the yard are to be made 0·7 per pound, or $15.68 per ton.

It remains to be seen what the result of the deliberations of the House of Representatives will be. Should it practically adhere to the report of its own committee, then it seems probable that a conference committee may be appointed to effect a compromise.

A POPULARLY SCIENTIFIC VIEW OF GOLD.

The *Popular Science Monthly* for February contains, together with the usual large and varied list of interesting and valuable articles in all branches of inquiry, a paper by F. VON BRIESEN, translated from the *Fortschritt der Zeit*, on "The Decrease of Gold," which we can not allow to pass without criticism. Both the high standard of accuracy to which this magazine aspires, and the high degree of excellence to which it has attained, render a lapse into crude and loose statements on its part peculiarly unfortunate. The general public is accustomed to accept what it finds in these pages as representing the present stage of scientific knowledge. We have usually found this confidence to be justified, and are consequently all the more surprised at the appearance under such auspices of the audaciously ignorant and absurd article to which we now refer.

Perhaps we can not demand of the editors of the *Popular Science Monthly* that they should be able to detect the blunders of authors in all lines of science. Yet in selecting materials for translation, they might assure themselves beforehand of the authority they thus appropriate. And, at all events, they are responsible for the accuracy and the English style of the translation. Now, the article in question was bad enough in the original : it has been ingeniously made worse by translation. The German amateur who concocted it can not be blamed for such statements as these : that platinum is only found "in excess" in the Ural Mountains ; that gold was "in excess" in ancient times ; or for the awkward and ungrammatical style appearing in every paragraph.

But these faults are cast into the shade by the astounding absurdities of the substance of the article. Beginning with the statement that gold and silver are the so-called precious metals, because they are rare, and that gold is rare because of its specific gravity, which has retained it mainly near the center of the earth, our author proceeds to inquire, "Whence the gold and platinum to be found on the surface of the earth?" We quote literally his reply :

"These two heavy metals are only found in places where volcanic rocks have penetrated through earlier formations, and the granite has split up. Platinum, only found in excess in the Ural Mountains, is obtained from rocks that have come up from below ; gold is found only in quartz veins. These veins have been formed in the following manner : As a natural consequence of the contraction of the earth's crust, internal revolutions, and volcanic eruptions, crevices opened, which were partly filled by hot springs, partly by eruptions with quartz. Rich deposits are often found in these crevices, called by the American miners 'pockets' or 'bonanzas ;' but besides these bonanzas, crevices contain no gold, and only the hope of encountering them leads to their being worked."

Of course, every body who knows any thing about the subject knows very well that platinum is nowhere "in excess ;" that it is nowhere obtained from rocks, but everywhere from alluvium ; that no connection can be traced between volcanoes and the occurrence of either gold or platinum ; that eruptions of quartz are not known ; and that the majority of quartz-veins worked for gold contain it disseminated through the quartz, and not merely in pockets.

But although we have just been told that gold occurs only in quartz veins, we are now informed that

"The places in which gold is found may be divided into the following three classes—auriferous ore, auriferous veins, and auriferous alluvium. The first group contains ore, rich in magnesium, interspersed with gold. It is frequently found in the Ural Mountains. As a transition to the second class may be regarded the auriferous minerals, in rock of volcanic origin, as it occurs on the west coast of South America and in many parts of Brazil. The granite of the Erzgebirge in Bohemia, which contains tin, is a similar formation. Interesting as this class is, it is of little practical value to the gold miner."

We should say it was of value to nobody but the practical joker. The "ore, rich in magnesium, interspersed with gold," which is frequently found in the Urals, must be a humorous name for the occurrence of gold-bearing quartz (in the Urals and in a hundred other regions) in magnesian slates. And the auriferous minerals in volcanic rock, occur-

Digitized by Google

ring in South America and Brazil, and resembling stanniferous granite, is doubtless a humorous name for nothing at all. The gold of Peru, Venezuela, and Brazil is found either in alluvium or with quartz inclosed in crystalline schists, and resembles the tin-deposits of the Erzgebirge in one point only—that neither formation is volcanic.

So much for the class of "auriferous ores." Under the next head, "auriferous veins," we are told that

"In the older volcanic veins, the gold is not mixed with silver, and bonanzas are never found in them. In many of these veins, also, granite veins are encountered, and, although remote from volcanic regions, it is presumed that the gold was carried up by the granite. The celebrated 'Mother Lode' of California is a sample of this kind."

Farther on, we learn that

"The entire ridge of the Sierra Nevada consists of granite; but on the western slope, limestone is mixed with it. Where these two rocks come together, a belt from eight to nine miles wide, and running from north to south, is found, which contains all the gold leads of the district."

Of all the theories concerning the "Mother Lode" that human ingenuity has produced, this is the first that has classified that formation of quartz in slates as a contact vein between granite and limestone, into which the gold was carried up by the granite. But the account of the Comstock lode is not less original:

"The largest of these bonanzas is the Gold Hill mine, which lies 700 feet deep, and several companies have commenced to work this rich vein. The most important, the Virginia Consolidated, has sunk a shaft 1600 feet deep, and driven a tunnel of 20,000 feet in length through the side of the mountain, projected by Engineer Sutro, so as to work the lead from underneath. But it is, perhaps, too late, because results have not kept pace with expectations; besides this, the heat below the shaft is so great that work is almost impossible."

It is bad enough that Germans should have such stuff as this put upon them as history; but it is too much to ask the American public to accept second-hand idiocy of that kind. This penny-a-liner knows neither the facts nor the literature of his subject. His pretense to consider it "in its scientific bearing" is the only thing which can exceed for impudence his pretense to give its statistics. He has not even known where to go with his scissors. To serve up such hash as "popular science" would be a disgrace to any magazine; the discovery of such a blunder must be doubly mortifying to the editors of this excellent periodical; and we trust the sharp lesson will not be lost upon them.

REVIEW OF THE IRON MARKETS IN 1882.

The year 1882 has been an eventful one to the iron trade in many departments, but was far from being as prosperous as the year preceding it. The demand for finished iron and steel was not as heavy, and in all branches the course of the markets was downward, although, as a glance at our tables of weekly range of prices will show, the decline was very marked in a few cases only. In crude and finished iron, the long strike in the West stayed the downward tendency for a while; but it is a significant fact that, excepting nails, the long suspension did not produce any scarcity or have a lasting effect in holding up values. It may well be questioned whether we could stand to-day where we are had it not been for the rash attempt of the men to secure an increase in wages in the face of circumstances so unfavorable to their wishes. The course of the markets since their defeat clearly indicates that, even after an enforced curtailment in the production in the most important section in the country for nearly four months, the output of finished iron is slightly in excess of current requirements, and makers' stocks, that had probably run pretty low, are again rapidly replenishing.

The only figures which we possess to fall back upon in illustrating a rise or decline in the demand for iron and steel are the fairly accurate returns published by special journals concerning the mileage of new railroads built during the year. Even this can only furnish a vague idea, because the demand for the equipment, permanent way, and rolling stock for new roads is only a part of the quantity for which the railroads of the country call upon the iron and steel works. Like new construction, renewals fluctuate from year to year, and periods of activity in the former do not by any means coincide with those of a large demand for the latter purpose. It is even possible that relation between the quantities of metal required for new roads and for renewal of old track and equipment will change very materially during the next few years. The tendency of late is to load cars more and more heavily, and to substitute iron for wood more and more in car construction. The result will be, that tracks formerly strong enough to carry their loads will be rapidly battered to pieces, iron rails will require replacement by steel at a rapidly growing rate, wooden bridges will have to give way to iron or steel, and for the time being greater quantities of metal will go into cars.

It will be understood, therefore, that while, apparently, the railroads may be falling off as consumers, if their importance as such is judged by the reports of construction of new roads, they may be really taking largely increased quantities of metal. Such reports furnish valuable hints; but their significance should not be overrated, nor should any conclusions be drawn from them without due appreciation of the fact that they may be very materially modified by special circumstances. During the year 1882, 10,000 miles of new main track were laid, against 9358 miles in 1881, and of the present total of 114,000 miles, probably one half only is steel. While, therefore, the rate of building was as great in 1882 as in 1881, the supplies purchased were probably less, much of the demand having been anticipated. During the present year, there will in all likelihood be a falling off, though it will not be very serious, judging from the large number of projects now carrying out by strong parties.

The great event in the iron trade during the year was the long struggle between the Western rolling-mill owners and their men. After a number of conferences in May, the former refused to accede to the demand of the latter for an increase in the scale of from $5.50 to $6 for puddling on the basis of the 2·5 cent card rate. During June, a few small mills went in at the advance; but the great body of the Wheeling, Pittsburg, and Ohio mills formed a strong alliance, and remained firm during June, July, and August. In the beginning of September, the puddlers, under pressure of the men in the rolling and finishing departments, offered to accept $5.75 as a compromise; and when that was promptly rejected, they found themselves practically deserted by their fellow-workmen, and one by one the mills started up during the last weeks of September.

While the labor questions were thus agitating the iron trade, another great problem loomed up, which has since constantly occupied the minds of those engaged in the trade, and which, according to all appearances, will not reach a settlement for some time to come. The question of a revision of the tariff has found the iron and steel trades firmly united, all evidences of dissensions in the ranks having been promptly dealt with. We have not agreed with the policy pursued, and have frankly said so.

The imports of iron and steel continued very heavy during the year 1882. Official figures have been brought up only for the first ten months of the year, and are as follows:

IMPORTS FOR TEN MONTHS.

	1882.	1881.
Pig-iron, net tons	520,163	463,213
Castings, " "	1,953	396
Bar-iron, " "	68,755	32,591
Band, hoop, and scroll, net tons	5,146	736
Iron rails, " "	40,686	122,246
Sheet-iron, " "	11,098	5,350
Old scrap, " "	131,425	111,774
Anchors, cables, etc., " "	1,319	1,288
Steel rails, " "	163,178	204,437
Steel ingots, bars, sheets, and wire	$11,267,821	$7,983,893

The following returns of the British Board of Trade of the exports of iron and steel from Great Britain to this country during the year 1882 has just been received. They show some remarkable fluctuations, and are particularly valuable because they give figures on steel. It must be remembered, however, that "unwrought steel" includes both ingots and wire rods. The former have declined, while the latter have probably increased heavily. Though a decrease in the quantities is given above, the value has grown enormously, as our own import lists show:

BRITISH EXPORTS TO THE UNITED STATES.

	1880.	1881.	1882.
Pig-iron, gross tons	614,005	394,934	487,697
Old iron for re-manufacture, gross tons	197,653	99,859	94,710
Steel, unwrought, " "	44,066	135,268	131,177
Tin plates, " "	164,167	179,843	214,552
Hoops and sheets, " "	45,237	36,162	37,220
Bar, angle, bolt, and rod, " "	51,413	18,858	22,255
Railroad iron, including steel and iron rails	221,131	292,617	198,278

American Pig.—Mr. James M. Swank, Secretary of the American Iron and Steel Association, estimates the production in 1882 at less than 1881, but as yet we have no data to form a definite opinion concerning the output. It is likely that the decrease will be found to be heaviest in those sections directly affected by the strike, while in other districts, notably those of the South, a marked increase will be found to have taken place.

The year opened actively in Eastern markets, large contracts in Foundry grades being closed during January and a disposition was manifested to carry prices upward. For Forge, quite a Western demand sprang up, which continued far into February, after the booking in Foundry had caused a relapse to quietude in those grades. March was quiet, there being occasional sales at steady figures, until a strike of the molders in the Troy foundries occasioned more uneasiness and led to a weakening of the market. April opened dull, with buyers assuming an expectant attitude and the makers of standard brands showing no disposition to make concessions. During this and the following month, consumers strictly followed the policy of buying from hand to mouth, encouraged by the fact that occasionally lots of less well-known brands were forced on the market. During May, there was considerable activity in foreign Bessemer iron, and large transactions were closed at declining prices with free offerings for future delivery. In June, the market for Foundry seemed to be getting into better shape, and large lots were taken, makers inclining to hold for better prices. Toward the end of the month, however, there were indications of accumulations on the Schuylkill. July opened quiet but firm, makers of choice and standard brands showing no anxiety to sell, while leading consumers held that the strength of the market was abnormal. During the month, a growing scarcity was developed in the better brands, and in many cases buyers had to fall back on brands lower in grade, thus improving the market for the latter. Gray Forge stiffened a little temporarily, and Bessemer pig recorded large transactions at lower figures. In August, No. 2 became more abundant, and there were round sales of mill irons. Makers continued firm, and the demand was encouraging. In September, consumers of inferior brands and forge irons showed a tendency to hold off; and in October, evidences of an over-supply in the West caused the market to weaken, and a downward tendency developed. Meanwhile, the scarcity of the best brands of foundry irons continued, and producers had no difficulty in marketing any available supplies at full figures. A greater disposition among makers in November to take orders led to greater activity temporarily; but the continued cry on the part of consumers for further concessions checked business, and, for a time, little was done. At the close of the month, and during December, greater weakness was displayed, and, although the deliveries on old contracts were heavy, future engagements were light. Buyers and makers maintained an expectant attitude, and inferior brands, at the close of the year, were pressing on the market.

Foreign Pig.—The trade statistics, just at hand from England, are encouraging, particularly so far as the situation in Scotland is concerned. The following figures of the official statistics of Scotch pig-iron will show this:

Stocks, end 1881	940,000		end. 1880		739,000
Production, 1882	1,126,000		1881	1,176,000	
	2,066,000				1,915,000
Consumption, 1882:				1881.	
Foundries	288,000			180,000	
Mill and steel works	297,000			217,000	
Foreign exports	432,175			356,115	
Coastwise "	184,021			103,414	
Rail "	28,804	1,230,000		28,471	975,000
Stocks, end 1882		836,000	Stocks, 1881		940,000
Decrease during 1882		104,000	Increase, 1881		201,000

It will be noted that, while the production was a little less than in 1881,

the local consumption was considerably increased and that the foreign shipments were in a less degree heavier. We have not as yet any reports as to the distribution of the foreign shipments. From the Cumberland District, which supplies the bulk of foreign Bessemer pig coming to this country, we have the following figures :

Production 1882	1,606.500 tons
Stocks	175,650 "
Shipments :	
Coastwise	457,966
Foreign	311,036 769,002 "

From the great Cleveland District, we obtain directly only small quantities of pig, the shipments from Middlesborough in 1882 having been 8650 tons against 6150 tons in 1881. The Cleveland market, however, very greatly affects the Glasgow markets, the shipments from Middlesborough to Scotland being heavy, 253,258 tons in 1882 against 323,748 in 1881. The following are the returns of the Cleveland Iron-Masters' Association :

	Production in— 1882.	1881.
Ordinary Cleveland	1,772,239	1,998,824
Hematite	916,411	671,515
Total	2,688,650	2,670,339
Stocks, December 31st	266,179	378,170
Foreign shipments	506,636	430,261
Coastwise "	931,273	931,411

It will be seen that the make for Bessemer steel purposes has more than counterbalanced the falling-off in the production due to a long-continued policy of restriction. Notwithstanding this generally favorable aspect of the statistics, the market is not in a good condition, and this is attributed to "the system of over-selling to such an enormous extent as to overlap the combined legitimate and speculative requirements, thus deluging the market with fictitious quantities, and upsetting all calculations based upon supply and demand."

Under the stimulus of advancing freights and higher quotations in Glasgow, the market for Scotch pig opened firm and a fair business was done, reducing stocks to a low ebb. Freight, which proved to be a leading factor in the trade during the year, and which repeatedly turned in a surprising and unexpected way, rose as high as 22 shillings. In February, a decline took place abroad, but the continuance of high rates here prevented a corresponding decline in our market, having only the effect of rendering the trade very quiet during February. Under the pressure of odd lots seeking a market, a weakening tendency developed in March, which, with declining freights in April, brought about lower quotations in that month. These induced more liberal buying in May, and with higher rates a firmer trade developed toward the end of the month. There were less frequent offerings of pig by outside parties, and toward the middle of June a better inquiry caused the market to gain strength. Holders, encouraged by favorable advices from Glasgow and stiff freights, were firm during the greater part of July ; but toward the end of the month, there were gathering signs of weakness. These, coupled with a falling off in the demand, declining freights, and a receding market abroad, encouraged free offerings for future delivery at lower figures. The month closed with freights down to 7s. 6d. and a generally dull market, which, however, gained some strength in the beginning of September. In the middle of that month, there was a flurry in freights, which rose from 7s. 6d. to 10s. to 12s., and caused a stiffening on the part of holders. Buyers, however, held off in October, considering spot prices too high, and, notwithstanding higher quotations abroad and stiffening freight rates and the acknowledged fact of a limited spot supply, persistently pursued the policy of buying from hand to mouth. This state of affairs continued during the first half of November, when a tendency to greater ease was produced through forced sales of odd lots. December opened with a break in freights to 8 shillings, which was followed by a steady decline till the close of the year. Consumers, anticipating a decline, kept out of the market, buying only in a small way to cover immediate wants, while importers sent a part of the arrivals into store.

During the latter half of the year, the scarcity of the better grades of American foundry irons probably led to a much more extensive demand for Scotch pig than would have otherwise been developed. The volume of business was, therefore, fairly satisfactory, though the unexpected turns of the market were on the whole discouraging to any speculative movements.

Steel Rails.—The greatest share of attention, even far beyond the narrower circles of the interests directly concerned, has been devoted to steel rails. The condition of this industry has given rise to much sensational talk, and, as we have had occasion to point out from time to time, there has been a good deal of exaggeration as to its status. Ingenious theories have been developed, attributing curious motives to the leading parties in the trade, when the simple laws of supply and demand were quite sufficient to account for the heavy decline that has taken place. The market has not alone been forced to take the enormous output of our own mills, estimated by Mr. Swank at 1,500,000 gross tons, and the heavy quantities imported, but it has repeatedly been forced to absorb considerable quantities thrown on it by parties who had bought at former periods, and whose means were not sufficient to carry out the plans they had made. Buyers with great success held off until the anxiety of makers, who, for the first time for years found themselves without engagements for months in advance, led them into a wild scramble for business. It can not be denied that the position of consumers was very much strengthened by the long agitation over the tariff question, the Bessemer mills having tacitly accepted a heavy reduction in the duty. No one cared to contract far ahead for future delivery, so long as it was not certain whether a reduction in the duty of $10 per ton seemed very probable. The reduction has now been fully discounted, and steel rails stand low enough to prevent any importations, even if the duty is reduced, and rails should fall to £4 5s. in England, a figure which they have never reached until now. Our mills are quite able to take care of the demand, and, with prevailing prices, have fully conquered for themselves the entire market which formerly was held by iron rails, and by imported iron and steel rails. For some years to come, the demand is not likely to overwhelm them in the sudden manner which characterized the "boom period," and the scaling down of contract wages in proportion to the increased rapidity of work at our modern mills places them in a better position to-day to repel inroads than they were in a year ago.

The market for rails opened quietly with values ranging between $57½ @$60 at mill, according to section and time of delivery. These were rudely shaken by the closing of a contract of 21,000 tons during the latter part of the month at $55 at mill, and a weaker feeling prevailed. February passed by with some good sales at $57½, until it became known that a large lot was offered, it was said, for effect, by several hands as low as $54½. March passed quietly, with quotations nominally at $55@ $57; but April opened with another plunge to $53½@$55, due to apparently *bona-fide* re-sales of rails caused by the collapse of immature railroad enterprises. Small sales during the middle of the month were made at $52 @$53, when the closing of a large contract at $50 at mill again staggered the market, from which there was a slight reaction at the close, small sales being made at a range of $50@$53. In the second week of May, the market received another shock, by the closing of a 30,000 contract at $47,50, followed again by a somewhat longer period of quietude, filled with a series of small transactions through the month of June at figures ranging from $47.50@51, according to delivery. July was characterized only by small sales, there being quite an active demand for moderate-sized lots, at $49@$50 for prompt and $47@$48 for fall delivery. This state of affairs continued until the middle of August, when one lot of 20,000 tons was closed at $45 at mill. Again the market dragged along, until in the middle of September there were some heavy sales at $45@$46 for winter delivery, closely followed toward the end of the month by transactions aggregating fully 200,000 tons, here and in Philadelphia, which established the quotation at $43@$45. In October, the higher figure remained the basis of the sales of the small lots selling, but, in November, even these were obtainable at $43@$45, the West evidently leading the decline. At the end of the month, it became known that a 40,000-ton lot had been secured at $40, and rumors of lower figures even were numerous. The low prices stimulated inquiry, but there was still a good deal of uneasiness, which culminated in December in the sale of 40,000 tons of steel rails by a number of Eastern mills, at an equivalent at mill of $38.50@$40, quickly followed by additional sales of 100,000 tons at $39@$40. The bottom had been reached, and the fact that the majority of the mills were now fairly supplied with orders began to tell, the next sale of 60,000 tons being made at $40, from which figure the market has now slowly but steadily recovered to $42.

THE LAW AS AFFECTING MINING AND METALLURGICAL INTERESTS.

LODES ON PLACER CLAIMS.

Secretary Teller has rendered the following important decision :

THE COMMISSIONER OF THE GENERAL LAND-OFFICE :

SIR : On the 11th inst., I dismissed the protest of Becker *et al.*, *vs.* J. P. Sears, respecting the issue of patent to the latter for his placer claim on Central City Mineral Entry No. 1790, Lot No. 302, Grass Valley and Ohio Mining District, Colorado. In so doing, I directed your attention to an alleged mistake in the survey, with respect to the relinquished "Soda lode," claimed by Becker, and instructed you to give it proper examination in passing upon the completeness of the final entry, before the issue of patent.

At the outset, Becker claimed this lode by virtue of an alleged location in 1861, defining it as 25 feet in width on each side of said vein or lode. By your order for hearing, dated August 13th, 1880, you required a certified copy of the location, and a diagram or plat showing the boundaries and extent, and its position relative to the survey of the placer claim. Instead of fairly complying with this, Becker filed a copy of what purported to be a copy of said original location, made June 4th, 1861, and recorded September 22d, 1873, calling for 25 feet surface ground on each side, together with an alleged re-location made September 16th, 1880, more than thirty days after your order, claiming by new lines and enlarging the surface ground to 75 feet on each side, and filed a diagram of the re-location only, without showing the boundaries of the original claim.

The testimony of the deputy surveyor shows that he did not follow the original location boundaries and monuments, but re-surveyed the vein according to his own notions of what would be a proper location, and fixed no permanent monuments or bounds to his survey on the ground,

Digitized by Google

but merely set two temporary stakes at the north end, "to indicate the points for Mr. Becker to establish permanent monuments hereafter."

Sears objected to this attempted re-location, and demanded that the showing be confined and responsive to the order made by your office in the case, calling for the true limits of the claim originally located. After the hearing, and before your decision, he relinquished the Soda lode claim, referring to his relinquishment to the survey No. 361, which number was given to the diagram filed by Becker, but which does not appear to have been approved by the surveyor-general as a survey of a claim. This number, however, appears to have properly belonged to the original survey made in 1873, filed as an advance claim in the case of the Montague placer claim, with which the Soda lode location conflicted, said survey being but fifty feet in width, and which the present diagram, as already shown, fails to show. Sears claims that it was this proper original survey of the Soda lode location which he intended to describe in his relinquishment; and you find, upon the examination that, as the re-location was entirely illegal, the exclusion of twenty-five feet only on each side of the vein or lode can be insisted upon. The attorneys for Becker ask, by letter of 17th instant, that your decision of 13th instant to this effect be submitted to me for final determination; but instead of basing any claim upon the relinquishment, they take issue with all the antecedent adjudications, and flatly deny the right of Sears to any portion of the placer claim. On the 18th, you submitted the papers accordingly. On the 18th, they also filed notice of their intention to ask for a review of my action of the 11th instant, dismissing the protest; and on the 20th, instead of filing such motion, they ask that the case be referred to the Attorney-General on certain interrogatories assumed by them to be vital, but which were held by me to lie beyond the necessity for consideration with reference to the case as it now stands. The relinquishment was in terms made by the attorney for Sears, October 21st, 1881, "to the end that the applicant for patent may be no longer delayed in securing title." It has never been accepted by Becker, who has persisted in opposing the whole claim up to the present time, and now, in support of his suggestion for a correction, fails to adduce any argument in support of his understanding of the instrument, but, on the contrary, renews his efforts to obtain a reopening of the whole matter. Appearing as a mere protestant he has not, in my opinion, such standing as will entitle him to claim any thing in the case, and can not rely upon mere technicalities; nor can he insist upon the enforcement of a relinquishment offered upon such conditions, even though it clearly covered, as in my judgment it does not, the spurious and unauthorized survey and re-location. He is estopped by his own failure to observe them.

But the law, Section 2333, Revised Statutes, clearly, in my opinion, carves out from a patent to a placer claim all known lodes found thereon at date of application, together with twenty-five feet of surface ground on each side as an incident thereto. As this was a known lode, however insignificant in value, and was not claimed by Sears in the manner provided by law, and is now at his request excluded from his final plat of survey, it necessarily forms no part of his claim. The residue, under your decision, may properly be patented to him, and I decline further to consider the objections raised by the protestants in the case.

Very respectfully, H. M. TELLER, Secretary.

NEW PUBLICATIONS.

SECOND REPORT OF THE STATE MINERALOGIST OF CALIFORNIA. *From December 1, 1880, to October 1, 1882.* *By* HENRY G. HANKS. Sacramento, Cal.: State Printing-Office.

With commendable industry, Mr. Henry G. Hanks, State Geologist of California, has gathered a mass of valuable and interesting data in his second report just issued. As a book-maker, Mr. Hanks does not reach the highest standard, to judge from the report before us. There is a neglect in classifying, in avoiding repetition which, while not detracting from the intrinsic value of the work, makes it less handy than it would be if it due attention were also paid to such an important consideration. Mr. Hanks has made a double volume of it, one part, containing 288 pages, being presumably entirely compiled by himself; while the second, very nearly as large, is termed an appendix, and contains five essays, by different authors, on a variety of subjects. It so happens that Mr. Hanks has written nearly 90 pages on placer and hydraulic mining in the body of his work, while in the appendix we find another short paper by Mr. F. W. Robinson on hydraulic mining, and another by Dr. Henry Degroot on hydraulic and drift mining. We readily concede that it is of the greatest interest to have the observations and experiences of three different authorities on a subject so worthy of elaborate treatment; but we do not understand why they could not be grouped together, or, better still, be brought into one paper, thus avoiding much repetition. We fully value the essays submitted; but we believe that they could have been more effective and useful in a somewhat different form. Mr. Hanks quotes very largely from Bowie, from Hendy and others, and a considerable part of his work seems to have been to furnish the connecting links for his scraps. He would have done better to assume that Mr. Bowie's paper was familiar to all, or if not, that it was accessible to every one interested in the subject whose duty it would be to study it carefully.

There is much material in Mr. Hanks's own writings which is evidently the result of careful observation, and he has made some original investigations. He has, besides, gathered with considerable industry and some skill data relating to the metal gold, its history, chemistry, the localities in which it is found, and the production. He reproduces the census figures without a word of comment.

Mr. Hanks also gives an account on the occurrence of iron ores in California, and a popular account of the works of the California Iron and Steel Company, which betrays his want of familarity with this branch of metallurgy. He has, furthermore, short papers on lumber and fuel, salt and its manufacture, mud volcanoes, diamonds, mica, roscoelite, vivianite, and diatomaceous earths.

In the appendix, we have first the two papers on hydraulic mining already alluded to. That of Mr. Robinson is a somewhat fragmentary series of reflections on questions affecting the mining of gold, and contains many suggestive points. A more elaborate paper is that by Dr. Degroot on hydraulic and drift mining, the second part being the most interesting and valuable. Mr. Melville Attwood, who is well known on the Pacific coast as a writer on gold milling, contributes one of his characteristic papers, which will command attention, although his conclusions may not be accepted as final. Prof. William P. Blake has a series of notes on the minerals and the geology of California, which are gathered for some unaccountable reason under the title of Rare Minerals recently Found in the State. The longest paper in the appendix is that by Dr. A. Kellogg on the forest trees of California. We are not sufficiently familiar with the subject to judge of its accuracy. We are impressed with the care with which it is evidently written, and feel convinced that the details given will be fully appreciated by those who are engaged in mining in California.

AMERICAN FOUNDRY PRACTICE. *By* THOMAS D. WEST. New York: John Wiley & Sons. 1882.

Fortunately the number of works written by men who have grown up in a trade, have gone through its trials, and have spent a lifetime in overcoming its difficulties, are becoming more and more numerous. They give the beginner aid and furnish him with valuable information on points which have never perplexed the polished writer of a text-book. Mr. West, who modestly styles himself "a practical iron molder and foundry foreman," wrote, we believe, a series of articles on molding and foundry practice for the *American Machinist*, and these have now been gathered in an enlarged and revised form in the volume before us. It is a book written and intended for the mechanic, a task for which Mr. West seems well qualified. It abounds in good common sense, and even Mr. West's attempts at the jocular and his occasionally severely didactic tone will be fully appreciated. He is not always happy in his explanations or his descriptions, but that defect is less annoying because the work abounds in good illustrations which materially aid in following him. So far as the detailed description and practical hints about green sand, dry sand, and loam moulding are concerned, Mr. West's is the best and most complete we have seen. The elaborate English, French, and German works on foundry practice which we possess deal more exclusively, unjustly so, on questions relating to the construction of cupolas, melting of iron, etc. The work of the molder, the skilled mechanic, has never yet received so full a presentation, and Mr. West's book fills a gap which will make it exceedingly serviceable to every engineer and founder. They will be glad to overlook Mr. West's manner and the lack of system and order in his work for the value which the practical information it contains possesses. The book is well and clearly printed and well equipped.

CORRESPONDENCE.

[Communications will be noticed only when accompanied with the full name and address of the writer. Unless specially desired, only initials will be printed. We invite criticism and comment by the readers of the ENGINEERING AND MINING JOURNAL. Replies not intended for publication should be addressed to the Editor of the ENGINEERING AND MINING JOURNAL in blank, stamped, and sealed envelopes.]

Coal-Tipping Cage.

EDITOR ENGINEERING AND MINING JOURNAL:

SIR: Will you please give me the name of the patentee of the coal-tipping cage illustrated in the ENGINEERING AND MINING JOURNAL of December 30th, 1882, pages 346 and 347? I intend to put it in, if practical.

WENONA, ILL., Jan. 18. L. J. H.

The design illustrated is not, to our knowledge, patented, and we believe that our correspondent is at liberty to use it, if it suits his case.

The Cranston Hydraulic Elevator.

EDITOR ENGINEERING AND MINING JOURNAL:

SIR: Will you kindly inform me where I can get facts about the Cranston Hydraulic Elevator for placer mining, or of any other new inventions or machines used for a similar purpose; that is, for working placers of small grade, or having insufficient dump? I should like to get descriptive circulars, price-list, etc., of such machinery, and do not know where to apply for the information except to you. S. E. J., Box 2062.

BOSTON, Jan. 22.

Since Mr. Bowie's classic paper on hydraulic mining, the most elaborate account of the methods and machinery has been printed in the annual report, just issued, of the State Mineralogist of California, Mr. Henry G. Hanks. For circulars, price-lists, etc., address Joshua Hendy, Nos. 49 and 51 Fremont street, San Francisco, Cal.

A Warning.

EDITOR ENGINEERING AND MINING JOURNAL:

SIR: Please caution the mining public against the arts of John Sidney Crawford, who will probably endeavor to place the Arroyo Grande tin mines, which he states are in Mexico, 300 miles southwest of Chihuahua. His specimens are alluring, his essay on tin engaging, and his speech seductive. He may offer one sixth of the mines for $5000 cash, with the understanding that there is no occasion to examine the property, owing to its great distance from market. JOHN W. BERKS.

ALBUQUERQUE, N. M., Dec. 6, 1882.

LAKE SUPERIOR IRON MINING INTERESTS.

Special Correspondence of the Engineering and Mining Journal.

The flurry in iron which contracted and darkened the horizon of Lake Superior producers from the beginning of November to the close of the old year has at least so far passed over our heads as to give us a clearer and wider outlook for future operations. As a rather unusual coincidence, the famous placing of orders for rails at $40 per ton at Scranton, and the ominous prophecies among furnace-men and steel-makers which immediately followed, were simultaneous with the reduction, for the winter, of the working force at the Chapin, Columbia, Jim Pascoe, Dalliba, and many other mines. The venerable Saginaw had petered out and closed down a few days before; the New York agent had made a hiatus of hoisting, to complete repairs of various sorts; the Mitchell engine-house burned to the ground a few days later, causing an entire stoppage of the pumps and hoisting-engine; and, treading on the heels of this calamity, came peremptory orders from the owner of the Goodrich mine to close down until further notice. One would have to be less mercurial and more sanguine than the average mining lessee, who, under the circumstances, did not find his

Digitized by Google

spirits working down rapidly toward his boots; and as for the miners, in locations where the stoppage had occurred, there was often not only distress but despair. In general, however, a much more buoyant spirit now prevails among both owners and operators. The Winthrop management has secured the lease of the Mitchell property, and has trained pipes from its boilers to the pumps of the mine, and is now working at high pressure, although the wages are at "half-pay." If there be a reasonable market, this mine, with its 25,000 tons of ore already in sight, can furnish an output next season approximating 60,000 tons. Captain Henry Davis has started up the Goodrich again, though with a curtailed force and none too sanguine hopes. In fact, all the mines of any account at all are now accumulating stock-piles with as great energy as ever before at this season of the year. The piles at the Cleveland, Lake Superior, Republic, and larger Menominee properties are already something formidable. And yet they are a few disturbing elements in the problem which cause uneasiness to those whose fortunes hang upon the die of a lively and profitable market. There is yet an enormous amount of unsold ore on the docks of various Erie ports, 500,000 tons awaiting purchasers in the harbor of Cleveland alone. Nor do there seem to be any very tangible tokens of a revival of demand for non-Bessemer material; as far as your correspondent can learn, no boats have been chartered by second-class producers, nor has he yet learned of any extensive order being placed for these ores here; on the contrary, he does know of several unsuccessful efforts to find buyers of ores of this class.

Another disturbing element is the depleted treasuries of second-class mines which depended upon ready sales for funds to meet current expenses, and which have been unable to find buyers. One of these, which bit off more than it could chew, now has an enormous unsold stock-pile in Cleveland, and a bankrupt treasury at the mine. To go ahead, therefore, this product must be sold for what it will bring, and the bidding of it may for the nonce disorganize the market to the great disadvantage of owners in this district. However, these and all other contingencies make against the non-Bessemer ores alone, and the first-class mines—and in these is the great bulk of mining capital locked up—will find a market, though undoubtedly at lower prices (the Republic $1 per ton less) for all they can possibly unload into the insatiable maw of the Eastern furnaces.

There is one phase of mining journalism which often excites surprise among the readers of this district; I refer to the silence with which the iron industry is treated when discussing the relative profit of mining the various metals—gold, silver, copper, quicksilver, lead, and nickel (the last named of which has paid but $10,000 dividends, as far as can be ascertained, in its whole history); while the remunerativeness of iron is passed over in silence, if not in contempt. And yet probably no industry not excepting coals, in America, is worked on so large a scale or with such an aggregate profit as iron. The dividends paid by the copper mines of Michigan were greater by $800,000, in round figures, than the entire dividends paid in any other State in the Union; but the dividends from the iron mines of this peninsula were undoubtedly greater than this by nearly one quarter, yielding, on the gross value of the output for 1882, $24,300,000, dividends approximating 12½ per cent, or about $3,000,000. This makes the proud record of giving as the net value of mining in Michigan during the year 1882 not far from $6,000,000. I am constrained to write here for the consolation of investors who have put their pin-money in the bauble schemes of other El Dorados, and who may visit this favored spot with a view to investment, the motto of our State, *Si quæris amœnam peninsulam, circumspice.* I had thought to write at some length on the recent movement of our individual mines, especially those copper ones which are listed among the stocks of the New York and Boston boards; but having fought thus far, will run away, in hopes to write some other day.

SPECULAR.

MARQUETTE, MICH., Jan. 20th.

HOT-BLAST STOVES AT THE EDGAR THOMSON FURNACES, D AND E.*

By Julian Kennedy, Braddock, Pa

When it was decided to erect these furnaces, the company also decided to use the Cowper type of stoves. It was, however, desirable to improve upon the plan of the stoves then in operation, to avoid, if possible, some defects which had shown themselves in them. The stoves now in use at furnaces A, B, and C are of the well-known type of Cowper stove, having a circular combustion-chamber placed at one side of the stove, and a regenerator with crescent-shaped section resting at the bottom on cast-iron gratings, which are supported in turn by cast-iron girders, the products of combustion passing up the chamber, down through the flues of the regenerator, and thence to the chimney.

The objection to this shape of stove, that the gases would not pass down the parts of the regenerator lying beside and behind the combustion-chamber—the horns of the crescent, as it were—did not apply to the newer form of stoves, with combustion-chamber having a straight wall next to the regenerator; but there were other defects, the principal ones being the small size of the openings through the regenerator and the material used for supporting it. The small passages (4 inches × 4 inches) soon choked up; and when a part of them became entirely closed, not only was the effective heating surface greatly diminished, but, as the remaining openings were not sufficient to absorb the heat fast enough, the products of combustion reached the bottom of the regenerator at too high a temperature, and caused the cast-iron gratings to crack and warp. The openings being very small and somewhat irregular, from the fact that they were built of tiles set on edge, and each course free to get out of vertical alignment with the preceding one, it was very hard to clean them when choked, it being very often impossible to pass a chain through them without first driving through gas-pipe, the pipe being screwed together in short pieces as fast as driven down.

After careful consideration, I decided, first, to adopt six inches as the smallest admissible size of openings; secondly, to abandon cast-iron supports for the regenerator; thirdly, to use only one pass through the regenerator; fourthly, to discharge gases from stoves and boilers into one common chimney; fifthly, to use round instead of square openings through the regenerator.

It is, of course, desirable not to make openings any larger than is necessary, as the heating surface is reduced by so doing. In fact, our new stoves, 21 feet × 72 feet 6 inches, with 6-inch openings, will have a little less heating surface in the regenerator than the old stoves, 20 feet × 56 feet, with 4-inch × 4-inch openings. I have no doubt, however, that the effective heating surface, after a few weeks' running, will be very much greater in the new stoves. One pass through the regenerator is better than three or more, provided the flues can be kept clean and the hot gases distributed evenly among them, for the reason that a larger area of openings is given and friction reduced, enabling more gas to be burned with a given chimney draught.

When the hot gases pass through a multiflue regenerator from top to bottom, the tendency is to even distribution, as, if one flue gets more than its share, it becomes hotter than the others, and so has more of an upward draught, which tends to crowd the gases down the other and cooler flues. For the same reason, the cold air entering the regenerator at the bottom has a tendency to ascend the hottest flues, so that when being heated and when being cooled the operation goes on very uniformly all over the regenerator. With openings large enough, even a very wide regenerator will work with the greatest uniformity, unless the passages to the chimney are badly proportioned, so as to allow the gases from one part of the regenerator to reach the chimney much easier than those from other parts.

The gases being discharged into the chimney at a temperature of 350 degrees Fahr., the draught is not very strong; but by also discharging the gases from boilers into the same chimney, we get say 40 per cent, at 350 degrees, and 60 per cent at about 700 degrees, which gives us a chimney temperature of say 520 degrees, thus greatly increasing the draught of the stoves. The boiler-draught is somewhat diminished, but this does not matter, as a draught strong enough for the stoves is far more than ample for the boilers.

Any one examining a dirty regenerator, with ordinary square openings, will observe that the most of the dirt accumulates in the corners. By making the openings round, we get rid of the corners, and I feel confident that much less dirt will accumulate in the flues.

The stoves as built at furnaces D and E are shown in the sketch. The regenerator brick are hexagonal in section, ten inches across, and have holes six inches in diameter through them. In building we use, for first course, a row six inches deep, then one three inches deep, etc. We then use six-inch brick all through, until we reach the top, when the work is leveled up by using three-inch brick in every alternate row. By this means, the joints between courses are broken and the openings kept perfectly true and straight from top to bottom. The regenerator is carried on fire-brick entirely, no castings being used. The chimney is 16 feet in diameter, inside, for 40 feet up; then it tapers in to 15 feet, which diameter it retains to the top. The hight from the point of entrance of the boiler-flue to the top is 235 feet.

From the bottom of the chimney, nine-inch partition-walls run up about thirty feet, giving nearly one quarter of chimney to each battery of three stoves, and little over one half to the boilers. From the top of these walls, the gases, of course, have one common flue.

DISCUSSION

MR. JOHN M. HARTMAN: When the Edgar Thomson Steel-Works gave our firm orders to prepare the plans and specifications of the two twenty-foot furnaces, B and C, they directed us to follow the designs of the Lucy furnaces, at Pittsburg, but allowed us to make any changes that would increase the output within certain limits. The largest volume of air blown in any twenty-foot furnace up to that time was 15,500 cubic feet per minute. The B furnace was designed to use 18,500 feet of air per minute, and the stoves contained 92,000 square feet of heating surface. After starting the A furnace and finding that the volume of blast used was greater than that originally intended, it was decided to increase the C stoves to 100,000 square feet of surface and use 20,000 feet of air, the B stoves having been finished by this time. After blowing in B furnace, Mr. Kennedy found he could blow more than originally intended, and increased the volume up to 28,000 feet for maximum, which would require 140,000 square feet of surface. In spite of this excess of air, the 92,000 feet of surface maintained 1050 degrees in the blast.

When C furnace was in full operation, Mr. Kennedy used 30,000 feet of air per minute, and maintained 1050 degrees with the escaping gas at chimney 350 degrees.

To heat this enormous volume of air, Mr. Kennedy was obliged to force the stoves with gas. As all the valves, regenerators, and chimneys were proportioned for 20,000 feet of air, it required constant care to use the large volume of gas properly. This will explain the trouble he speaks of. The two new twenty-foot furnaces, D and E, and that Mr. Kennedy is now building, have larger stoves, with better regenerators and chimneys, and I look forward to a production of 1500 tons weekly from each furnace.

NOTE.—November, 1882. The D furnaces have since produced 1825 tons.

Analyses of Canadian Phosphates.—We are indebted to Messrs. Camm, Kraft & Co., of Philadelphia, for the following analyses of Canadian phosphates. The first was made by I. Baker Edwards, of an average sample of a cargo sent to London from the Summit mines, Portland East, Ottawa County, Quebec:

	Per cent.
Phosphoric anhydride	38·75
Tricalcic phosphate	84·60
Calcite and other lime salts	9·50
Insoluble silicates	0·85

The following are analyses by J. Coupé, Paris, from the same mines, from three separate veins:

	Green Phosphate	Greenish-Red Phosphate.	Reddish-Gray Phosphate.
Phosphoric acid	40·896	41·407	40·129
Silicates	0·600	0·750	3·000
Peroxide of iron	1·900	1·050	1·589
Lime	48·384	48·988	47·476
Fluor	4·005	3·852	3·559
Calcium	4·215	4·003	3.747
Total	100·000	100·000	99·500
Phosphate of lime	89·153	90·267	87·481

SILVER MILLING AT CHARLESTON, ARIZONA.*

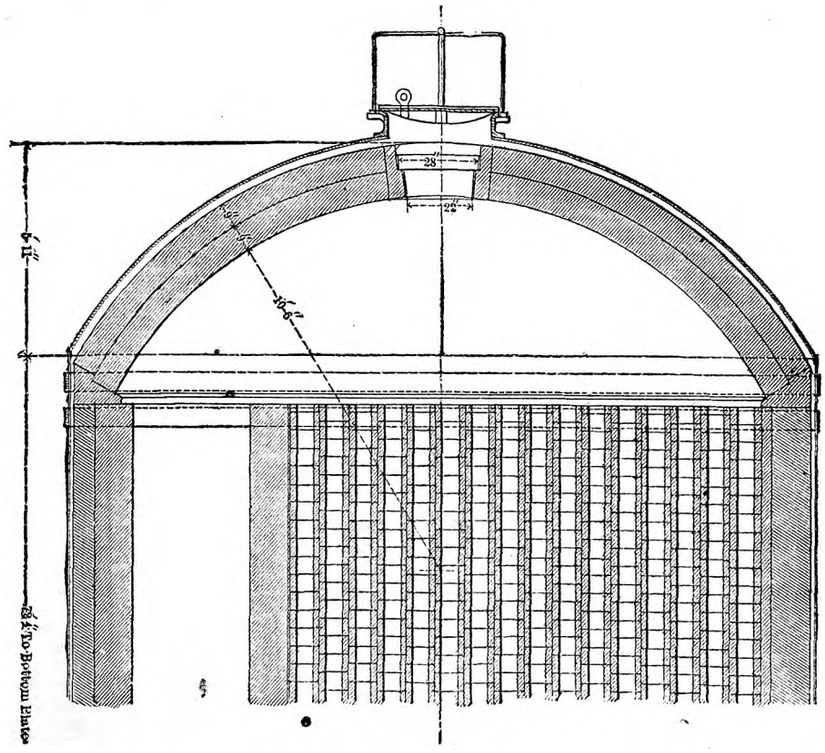
By W. Lawrence Austin, Ph.D.

Most of the mills working the ores of the Tombstone District are distributed along the line of the San Pedro River, at an average distance of ten miles from the mines at Tombstone.

The works at Charleston, of which I am manager, are the property of the Tombstone Mill and Mining Company, and are under the general supervision of Prof. John A. Church.

These mills were originally intended for dry crushing, and were provided with rotary driers, automatic roasters, and all the necessary paraphernalia for a chloridizing roasting, as it was expected that the ore would become base as depth was obtained in the mines. But, contrary to expectation, the deposits retained their free milling qualities as they went down, and the furnaces were never brought into requisition. Upon ascertaining the true character of the ore under treatment, it was decided to change the batteries to "wet crushers," in order to increase their capacity, which alterations injured the symmetry of the plant, and left it working at some disadvantage over what might have been had such a change been foreseen in the original designs.

The smaller of these mills (the Pioneer mill of the district) was originally built by the company as an experiment, and constructed with an eye to economy; a wise precaution, as many have learned to their cost who have anticipated developments in their mines by the construction of expensive reduction-works. This mill was originally fitted with ten stamps, four pans, and two settlers, and run by a Leffel turbine, water being brought in a ditch from a dam about one mile up the river. Later, in order to increase the capacity, five stamps, two pans, and a settler were added. To run this additional plant up to the necessary speed required more power than the turbine could furnish, so an engine was purchased as an auxiliary. The second and larger mill was subsequently acquired by the company. As both mills run on ore from the same mines and the processes are identical, a sketch of one mill will suffice for both.



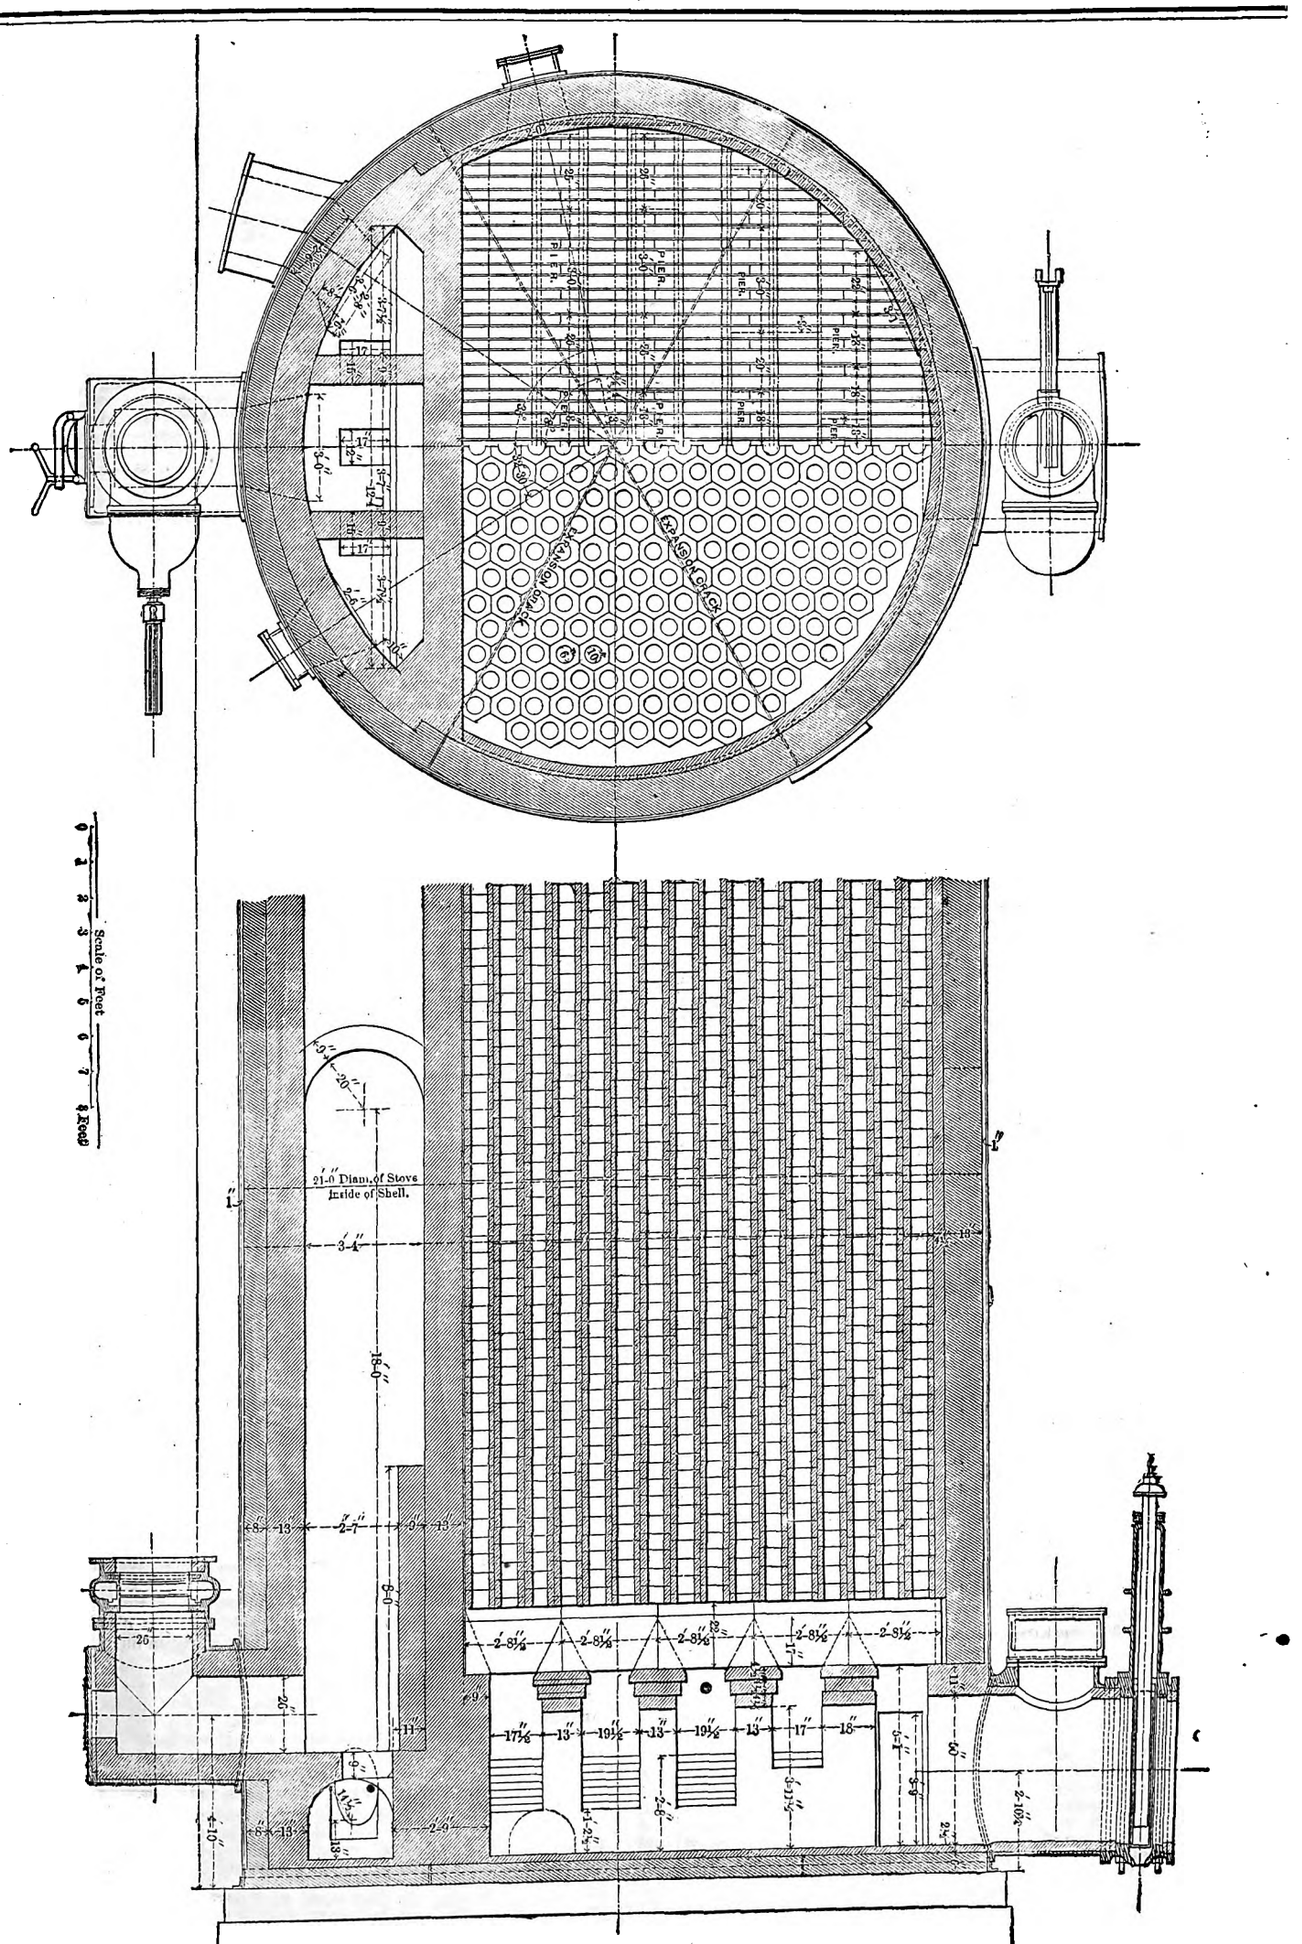
It is to be regretted that, owing to the separation of the mills, consequent doubling of the pay-roll, and increased expenses from every source, the cost of milling given below will be scarcely a guide to what could be done with a properly arranged plant. I do not hesitate to say that, with altered conditions, a reduction of 20 per cent per ton in the cost of ore milled could be effected, the quality of the work remaining the same.

In the following hasty sketch, reference is had to the larger mill alone. The power is furnished by a horizontal engine with Corliss bed and Meyers patent cut-off, making 70 strokes per minute. The cylinder is 16 inches × 36 inches. This engine runs with remarkable smoothness, and is not shut down more than once in sixty days, and then only to afford an opportunity for cleaning out the boilers, in which, owing to the water used, a scale rapidly collects. These latter are tubular, 54 inches × 16 inches, and carry steam from 90 to 100 pounds pressure. Farciot's patent pump and heater feeds them, pumping the water in at boiling-point. They consume on an average seven cords of mixed wood per day, costing $9 per cord; black oak, white oak, willow, and pine being used indiscriminately. All the water for the mill is pumped a vertical hight of 100 feet by a No. 5 Knowles steam-pump, placed 200 yards from the mill, which readily supplies more than is consumed. Steam is carried to this pump from the mill boilers. The ore is brought down from the mines, a distance of ten miles, in wagons. These wagons are connected in pairs, weighing about 5 tons; they carry 14 tons of ore between them, and are drawn by sixteen mules. This hauling is done by contractors at $8 per ton. The bottoms of these wagons consist of a series of pieces of plank, 6 inches × 2 inches, laid crosswise, their ends resting on the framework of the wagon-bed, so that, when removed one at a time, they allow the ore to drop out, and permit a rapid and easy unloading. It requires on an average twenty minutes to unload a pair of wagons constructed on this plan, and, as they are filled at the mines from self-discharging chutes, the driver has little labor in loading and unloading.

The ore is wheeled in barrows from the dump to the crusher, through which it all, coarse and fine, passes, no screens being provided. One of Hendy's breakers is used. The bottoms of the chutes leading from the breaker to the bins are, for a distance of 5 feet, made of ½-inch steel bars set ⅜ of an inch apart, allowing all the finer materials to fall through on to a shaking-screen hung below. This shaker is provided with the same screens that are used in the batteries, and separates that portion of the ore already sufficiently fine not to need crushing, which is sent directly to the pans. This relieves the batteries materially, and decreases the amount of "slimes." By this simple contrivance, the capacity of the mill was increased 5 per cent, or more, the amount depending on the fineness of the ore, and also on its per cent of moisture.

The batteries are fed from the bins by the Hendy-Challenge self-feeders, which here, as elsewhere in my experience, give entire satisfaction. The stamps are 20 in number, drop 100 times a minute, fall 6½ inches, and when freshly shod weigh about 750 pounds; the weight being divided as follows:

Stem	340 pounds.
Boss	200 "
Tappet	90 "
Shoe	120 "



The die weighs about 85 pounds. Some of the stamps carry extra tappets, bringing their weight up to 800 pounds and over. The shoes have an average life of one month, and when worn out weigh about 35 pounds. A novel feature of these batteries is the arrangement of the guides; instead of being grooved to receive the stem, square recesses are cut, into which wooden keys are fitted, so that the grain of the wood is parallel to the motion of the stem, instead of across it, as is usually the case. With such an arrangement, the guide-boards themselves are subject to no wear, the keys being easily taken out and replaced. This plan might be advantageously adopted where light stems are in use which are liable to spring, and in such a condition saw out guide-boards very rapidly. But when stems of from 3½ inches to 3⅞ inches are used, they present no advantages over the old plan. The mortars have double discharge, but the rear discharge has been blocked up with wood faced with iron plates, as close to the stamps as practicable. The average product of these batteries, during the first six months of the year, including stoppages, has been 2·9 tons of medium hard rock to the head of stamps, per day of twenty-four hours, crushed through a 30-mesh screen. Various screens have been tried, but the best results have been obtained from Russian iron screens, vertical slotters, with a "burr" on the inside.

From the batteries, the pulp goes into settling-tanks. The pans, eight in number, are flat-bottomed, 5 feet in diameter, 3 feet high, and have wooden sides of Oregon pine curbs, 2½ inches thick. The die is a solid cast-iron ring 1½ inches thick, weighing 750 pounds, and occupying most of the space between the cone and sides. It is fastened in with Portland cement. The muller, weighing 570 pounds, carries eight shoes weighing collectively 816 pounds. Each pan is provided with three wings shaped like a reversed plowshare. The settlers are 9 feet in diameter, with iron mullers shod with wooden shoes 6 inches high. On the average, a ton and a half, dry weight, of sand and slime are put in a pan for a charge, and the time required for amalgamation varies from three to five hours after charging the quicksilver. Repeated experiments have shown that little is gained by running the pans over four hours; the same ore, treated side by side under the same conditions in pans running respectively on four and six hour charges, gave a gain of one per cent in favor of the

THE HOT-BLAST STOVES AT FURNACES D AND E OF THE EDGAR THOMSON WORKS.

Digitized by Google

six-hour charge, but this slight advantage did not compensate on low-grade ores for the limited capacity of the pans. Tests made on pulp while undergoing amalgamation showed that one hour after charging quicksilver, 74·66 per cent of the silver was already taken up, and that in the succeeding hours 76·26 per cent, 77·74 per cent, respectively, until the end of the fourth hour, when 81·04 per cent was found to have been extracted.

After that period, nothing material was gained by prolonging the operation. For a long time, owing to the excellent quality of the ore, no auxiliaries, other than steam and the iron of the pans themselves, were needed by the quicksilver to effect amalgamation. Identical results were obtained with or without the use of chemicals. Little by little, a change crept in, the milling percentage sank, the bullion became less fine, and sulphurets of the base metals made their appearance in the ore. Tests made with a view of determining the aid to be derived from the use of bluestone and salt showed that in an ore containing only 7 per cent of its silver in the form of chloride, 87 per cent of the silver present could be brought into combination with that element by the aid of these two "chemicals." The remaining 13 per cent was apparently shut up in the base sulphurets and carbonates, and could not be chlorinated in the pans. The result of a series of experiments with these and other reagents led to the adoption of 150 per cent of bluestone and 500 per cent of salt, the amount of silver in the ore being taken as 100 per cent, and by this means the milling percentage was brought back to its former standing. Still the bullion resulting left much to be desired. The question then resolved itself into this, how to make fine bullion from very base ores, and at the same time to keep up a satisfactory milling percentage.*

Three methods suggested themselves, namely, either to prevent the amalgamation of the base metals on the pans,† or, if that proved impracticable, to eliminate them from the amalgam before retorting, or during the melting. Although several metals were taken up by the quicksilver, in varying quantities, and so found their way into the bullion, still the only one that caused any serious trouble was lead, which was reduced by the action of the pans and almamagated as readily as the silver itself. A noticeable feature in regard to the basing of this bullion was, that it became serious at the same time that wulfenite appeared in considerable quantities in the ore. Whether this mineral was the prime cause of the trouble, I am not prepared to say; but we did not have the same difficulty when the percentage of lead was much higher in the ore, but in the form of cerussite or galena.

The ore was crushed through a screen corresponding to a 35-mesh wire cloth, and subsequently ground for one hour in the pans. By giving up the grinding in the pans, and by using finer screens in the batteries, but little of the lead was taken up; and by the use of lime, etc., in cleaning the amalgam, as already described above, the bullion was brought up to ·970 fine; the remaining base, being principally copper, resulting from the bluestone used, was not of sufficient importance to extract. The extraction of copper, even after it has been amalgamated, presents no difficulties, as has been successfully demonstrated on a working scale at the tailing mills on the Carson River.

The ores of the Tombstone District carry a varying amount of gold, which in some cases is visible; but in others, it only makes its presence known by the assays. At Charleston, it is not positively known in what form this metal occurs, as it is never visible. Assays for the first six months of this year show that only 43 per cent of the total gold value of the ore was saved. This value, however, rarely reaches two dollars to the ton. The amalgam is retorted in 15-inch top discharge retorts. About four cords of willow wood are consumed to the ton of amalgam. The firing lasts five hours, and the charge varies from a ton upward.

For bullion averaging ·938 fine, the loss by volatization and skimming averages 7·55 per cent, and the time required averages three hours twenty-one minutes. The average weight of the bars is 2711 ounces, which require 43 pounds of charcoal and 20 pounds of coke. The average cost of milling for the past five months has been $4.90 per ton. This amount was subdivided as follows:

Fuel	$1.05
Chemicals (including quicksilver)	0.77
Lubrication	0.04
Illumination	0.03
Castings	0.33
Supplies	0.16
Labor	2.52
Total	$4.90

COST OF LABOR IN REDUCING ONE TON OF ORE ‡

Crushing	$0.52
Amalgamation	0.67
Power, pumps, etc	0.47
Foreman, etc	0.87
Tailings pit	0.11
	$2.64

The loss in quicksilver to the ton of ore milled varies according to the grade and character of the ore, but averages about 1·3 pounds. About 0·11 cord of wood and 1200 gallons of water are consumed to the ton.

GENERAL MINING NEWS.

ARIZONA.

COCHISE COUNTY.

BENSON SMELTING AND REFINING COMPANY.—The furnace started on December 28th, and to the 14th of this month has turned out 250 tons of base bullion. The smelter has a working capacity of at least forty tons daily, and with some alterations which are contemplated will smelt from 55 to 60 tons. The company purchases all kinds of ores, and the location is such that it can receive from both ways on the line of the road, and it is also the most convenient point for the Sonora ores. The company owns two large lead mines. For a time, some difficulty was experienced in finding iron ore for flux, but fortunately a large deposit was obtained near Lordsburg.

*The experience of a former management was very similar; when grinding was carried on two hours, the bullion sank to from ·200 to ·300 fine, and even lower. By crushing finer and not grinding at all, it rose in a day or so to ·900 fine and over. By grinding one half-hour, it was kept at ·850 fine.

†I am indebted to Mr. J. M. Adams, of San Francisco, for valuable suggestions in regard to the handling of ores containing lead in pan amalgamation.

‡This table has reference simply to a single month's run, or, what is the same thing, to the working of 1730 tons of ore.

TOMBSTONE DISTRICT.

Recent dispatches state that active operations have been resumed on the Bunker Hill and Rattlesnake mines. A large body of good ore has been struck in a tunnel in Military Hill, in the Big Pedro mine. The Anchor mine is improving in quality and quantity of ore. Some of the ore assays $300 per ton. The hoisting-works on the West Side, Ingersoll, and Stonewall mines are nearly completed. Work on the Horseshoe mine has been resumed. The lessees of the Mamie mine are taking out considerable rich ore.

PIMA COUNTY.

SANTA CATARINA.—It is stated that at a depth of 40 feet a vein of six inches of almost pure metallic copper has been struck.

PINAL COUNTY.

PINAL CONSOLIDATED.—The official report says: Our small furnace is turning out about nine tons bullion daily, from about twenty tons of ore, of which latter we have already mined and stored at furnace, chutes, and drifts, 10,000 tons. Another furnace will soon be added, of a capacity of 50 tons, which will be a matter of little expenditure, there being sufficient boiler capacity to run three furnaces. Besides our lead-ore proposition, we have already developed large bodies of dry free-milling ores, assaying from 50 to 80 ounces silver; and being situated on the Gila River, we have taken up water-rights and mill-site for the purpose of erecting a twenty-stamp mill within this year. However, we are not rushing it, in order to accumulate funds from the result of our smelters. We have plenty of wood and water, and had our Eureka smelter been a more scientific one at the start, we should have been running ten months ago.

SILVER KING.—At the annual meeting, held in San Francisco, January 9th, the following officers were elected: B. A. Barney, President; J. L. Jones, Vice-President; James M. Barney, General Manager and Treasurer; R. M. Phillips, Superintendent; and Joseph Nash, Secretary. The general manager's report shows that the production of the mine has been about the same as the year preceding, and that the mill and reduction-works have been kept in constant operation to their full capacity. Sinking the main vertical shaft will soon be resumed, probably during the present month. The construction of a railroad connecting the mine with the Southern Pacific Railroad is not, as yet, commenced; but its necessity has not been lost sight of, or larger reduction facilities where the water supply would be adequate. The outlook for the future seems as favorable as has been the experience of the past. The superintendent's reports show that the mine looks well throughout, and that the several levels and drifts have been worked very successfully. Below the 510 level the mine is dry. All the ground has to be blasted. The ventilation is good. Eighteen thousand eight hundred and sixty-three tons of ore have been delivered at the mill. Eighteen thousand of them were taken from the 714 level; the rest, with but few from the 408, came from the 510 level. Three hundred and fifty tons remain on the dump. The reduction of ore by leaching ceased October 31st. November gave an opportunity to closely test the work, and the following was the result: 1523 tons of a value by assay of $61 8-100 per ton, gave 78 944-1000 tons of concentrations of a value of from $1094 to 1555-10,000 per ton by assay. Thus, 19 41-100 tons were dressed down to one ton. The ore shipped weighed 5 16-100 per cent of that crushed, the loss being 7 69-100 per cent, or $4 9534-10,000 per ton. Over one third of the value was in native silver.

The secretary's report gives the following:

RECEIPTS.

Balance on hand January 1st	$31,739.02
Ore and concentrations	369,475.19
Bullion	371,910.67
Superintendent	523.45
Freight	1,076.98
	$774,724.71

DISBURSEMENTS.

Sampling and assaying	$286.10
Expenses	4,553.77
Insurance	750.00
Law	1,210.00
Experiments	632.39
Merchandise and lumber	38,893.64
Freight	21,474.81
Dividends	300,000.00
Superintendent's draft account of expenses at mine and mill	364,538.23
Balance in treasury December 30th	39,285.77
	$774,724.71

Forty-five thousand ounces silver on hand, $1 per ounce.

NEW COMPANY.

The following company has filed articles of incorporation:
Ida Gold and Silver Mining Co. Capital, $1,500,000. Operations, Pima County, Ariz. Principal office, Fond du Lac, Wis.

CALIFORNIA.

BUTTE COUNTY.

SPRING VALLEY.—The secretary reports that a telegram states that the clean-up at the mine yielded over $100,000, and that a further clean-up in a month's time will yield $25,000 more. This will represent the product of a little over six months, and now that we are in a position to work the lower tunnel to advantage and shall be using a third more water than hitherto, it is only reasonable to suppose that this rate of production will be largely increased. During the late run, we had not this increase of water, and were not washing through the lower tunnel under favorable circumstances, it having been only recently that a sufficiently large opening was made in the gravel at the mouth of this tunnel.

FRESNO COUNTY—NORTH FORK MINING DISTRICT.

DE SOTO GROUP.—This group consists of the De Soto and River View lodes, lying under the Cathedral peaks on the head-waters of the San Joaquin River. The ores, says the Bodie *Free Press*, are sulphureted, bearing silver, and will average at least $40 per ton. Careful examination and measurement show the ledge to be fifty feet wide from wall to wall, no gangue intervening. The facilities for reduction are second to none, there being dense forests of timber on the mines; water is easily obtained from the high falls on the river above the lead. These mines have been opened at four different points along its trend, and show vast bodies of mineral. The field-rock is a porphyry on the foot and a talcose slate on the hanging-wall, which is so characteristic of a true fissure-vein. Negotiations are now on foot that will probably result in the disposition of this property to Chicago capitalists in the spring.

MONO COUNTY—BODIE DISTRICT.

BODIE CONSOLIDATED.—During the past week, 135 tons of ore were crushed, average pulp-assay, $48 per ton. Bullion shipments, $5723.

BODIE TUNNEL.—About 40 tons of ore are crushed daily.

NOONDAY AND RED CLOUD.—These companies have filed petitions of insolvency through their secretary.

STANDARD.—During the past week, 1427 tons of ore were extracted, $25,572 bullion shipped. The cross-cut 1000 level, is in 1190 feet, and the east cross-cut from south drift, same level, is in 210 feet. There is no change to report.

PLUMAS COUNTY—GREENVILLE DISTRICT.

CRESCENT.—The pumps were started up and are working very well, lowering the water in the shaft four feet per day; at this rate, it will be but a short time before the Ophir vein will be reached from the shaft, when work can be done to much greater advantage than at present. It is the intention to continue the

Digitized by Google

drain tunnel around and above the shaft; when this is done, it will intercept and carry off a large amount of water that now finds its way into the mine, and to that extent will reduce expense. The ore continues to be as rich as before, and the body increases in size with further development; eight stamps are running, four more have started up; still other batteries will be put to work as soon as new ground is opened up, till the whole milling capacity is fully employed.

SAN BERNARDINO COUNTY—PROVIDENCE MINING DISTRICT.

BONANZA KING.—The working results of the new ten-stamp mills of this company, at Providence, are said to be highly satisfactory. The bullion shipments for the first half of January were $32,525. The Atlantic & Pacific Railroad will reach these mines in about thirty days.

GORMAN & DWYER.—A recent discovery of a large body of surface ore is reported to have been made.

NEW COMPANIES.

The following companies have filed articles of incorporation:

Addie Gravel Mining Co. Capital, $1,000,000. Directors: Columbus Waterhouse, H. K. Waterhouse, F. A. Waterhouse, J. M. Jackson, S. W. Howland, M. Parker, H. W. Bragg.

Amazon Consolidated Gold and Silver Mining Co. Capital, $10,000,000. Operations, Mono County, Cal. Directors: J. H. Rennshofen, J. J. Ray, Stephen Otis, J. F. Johnson, Francis C. Weston.

Antelope Milling and Mining Co. Capital, $4,000,000; shares $20 each. Operations, Cochise County, Ariz. Directors: Alexander Badlam, E. H. Fritch, Joseph W. Winans, W. P. Coleman, E. B. Baldwin, and E. H. McMillan, of San Francisco, and W. N. Wash, of Cochise.

Black Range Consolidated Mining Co. Capital, $10,000,000. Operations, New Mexico. Directors: S. Heydenfeldt, Henry M. Levy, Morris Hoeflich, Robert Sherwood, and A. Borland.

Guadalupe Mining Co. Capital, $500,000. Operations, Lower California. Directors: Hugh McCormick, George H. Dana, J. P. Manrow, D. P. Drexler, and Homer S. King, of San Francisco.

Head Center and Tranquillity Mining Co. Capital, $2,000,000. Operations, Tombstone District, Ariz. Directors: F. A. Benjamin, T. E. Jewell, A. W. Foster, W. Kohl, R. W. Lilienthal, J. M. Gitchell, J. W. Pew.

Headlight Gold and Silver Mining Co. Capital, $1,000,000; shares, 50,000. Directors: P. Bargion, S. Booth, Walter Story, G. J. Johnson, Thomas Crowley, and Charles Hollister.

Indian Springs Mining Co. Capital, $4,000,000; shares, 80,000. Operations, Indian Springs, Cal. Directors: M. C. Taylor, H. L. Hatch, Jacob Weissbein, John Johnston.

Ibex Mining Co. Capital, $1,000,000; shares, 100,000. Operations, Saratoga District, Cal. Incorporators: G. K. Dias, J. B. McClure, and R. S. Rhodes. Principal office, Chicago, Ill.

Omilah Gold and Silver Mining Co. Capital, $2,000,000. Directors: A. F. Williams, John Lowrie, S. J. Marsten, J. C. Green, D. S. Rouse, and W. W. Whitman.

Rappahannock Gold Mining Co. Capital, $2,000,000. Directors: P. B. Cornwall, Richard Chute, James McCord, Alexander Harner, and John A. Davis.

Superior Mining Co. Capital, $10,000,000. Directors: George C. Perkins, J. B. Haggin, J. C. Logan, J. C. Hump, Louis T. Haggin.

Wallis Consolidated Gold Mining Co. Capital, $1,050,000; shares, 210,000. Operations, California. Directors: N. H. Ball, H. J. Redmond, H. C. Stout, B. F. Littlejohn, H. W. Wallis. Principal office, Forest City.

CANADA.

A well-informed correspondent sends us the following notes: The most prominent among the minerals in Canada which have come to public notice quite recently are iron and phosphate of lime. The former is found in almost all the provinces of the Dominion. Most of the localities where important discoveries of iron have been made are fortunately situated near transportation facilities, and the ore occurs generally near the surface. The remarkably excellent quality of the Canadian metal, and the low prices of labor and material employed in its production, have made it a desirable article to the manufacturers in the United States. The chief districts operated in successfully by American capitalists are the Madoc region and the Kingston and Pembroke region. The output from the latter for the past season amounted to 40,000 tons, which were shipped through the port of Kingston. Preparations are now making to increase the production for the coming year, which will doubtless reach 100,000 tons of Bessemer ore from this port. Numerous new discoveries have been made, and as new lines of railroad are in course of construction through this region, great results may be looked for. There is an excellent opening for the establishment of a blast-furnace in this portion of Ontario, the country being heavily wooded, and the cheap supply of charcoal can be depended on for a long period of years.

Apatite or phosphate of lime is a common mineral in the limestones of the Laurentian rocks, sometimes disseminated in minute green or reddish crystals, and at other times so abundant as to make up a great proportion of the rock, and in some cases to form beds of a nearly pure crystalline apatite. Of late years, the increasing demand for phosphates as fertilizers of the soil has drawn attention to the use of this mineral in a prepared form, and the supplies existing in Canada are receiving considerable attention. In the province of Ontario, the deposits of phosphates which have been worked in the past with good results exist in the counties of Leeds, Lanark, and Frontenac, the most noteworthy being in what is called the North Burgess Phosphate Basin, which has been found to have a thickness of from 2600 to 3000 feet, forming a belt or zone running from the northeast to southwest through the townships of Burgess and Crosby. The analyses made from ore taken from this locality gave on an average 88 per cent of phosphate of lime. Particular attention is now drawn toward the county of Renfrew (the Cobden District), where some important discoveries have been made. Extraordinary deposits and veins of great width and promise containing a quality of phosphate assaying as high as 90 per cent phosphate of lime have been opened, and preparations are making to work them on a large scale.

In the province of Quebec, the Ottawa District has recently become noteworthy, and the production of apatite for shipment to England has been very large. The veins and deposits are of an irregular nature and the country-rock is chiefly of pyroxene. The apatite of this region is always fluor-apatite, and varies from compact or crypto-crystalline to coarse granular, frequently exhibiting a distinct lamellar texture. The analyses of apatite from this region average 88 per cent of phosphate of lime. The product of the Ottawa District for the past season has been over 24,000 tons. This branch of industry is greatly improving, and has proved one of the most profitable and at the same time safest investments yet introduced to the capitalist in the shape of mining.

ALBERT.—The mine was first opened in 1865, but work was discontinued till July, 1881, when it was purchased by a New York firm, which has done much to improve the property. From July to the end of the year, about 1850 tons were shipped to New York. The output in 1882 was 4800 tons. The Albert ore contains from 4 to 6 per cent copper and 35 to 40 per cent sulphur. The number of hands employed in this mine is 70 or 80, with wages the same as in other mines. The depth of the mine is about 300 feet.

CROWN.—This mine, the property of the Orford Nickel and Copper Company, produced in 1882 about 20,700 tons, which contains about 4·8 per cent of copper, 40 to 45 per cent sulphur, and from 2½ to 3½ ounces of silver per ton of ore. The depth of the Crown mine is now about 900 feet on the dip of the vein, which varies from six to thirty feet in thickness. A tunnel 1000 feet long strikes it at the eighty-five fathom level. A hoisting-engine is placed at the inside end of the tunnel, by which the ore is raised from the bottom in cars, which then run out through the tunnel to the dressing-shed, a distance of about 2000 feet. A boiler outside the tunnel supplies the engine with steam by pipes. From the dressing-shed, the ore, after separation from poor rock, is carried by a tramway to the Passumpsic siding, about half a mile, where it is dumped on cars for shipment. The average number of hands employed by the company in 1882 was about 300, with rate of wages as follows: Miners and strikers, $1.25 to $1.50 per day; trammers and laborers, $1 to $1.25, and boys 40 to 60 cents; tradesmen, $1.75 to $2.50 per day.

HARTFORD.—The mines are owned and worked by the Canadian Copper and Sulphur Company (Limited). It is the same vein as that worked by the Orford Nickel and Copper Company, and varies in thickness from a few inches to 15 or 20 feet. The ore contains from 2 to 5 per cent copper and from 35 to 45 per cent sulphur. The output of the mine is about 900 tons monthly, the greater part of which is smelted at Capelton though a small quantity has been shipped to New York for treatment. The number of hands employed by the company is about 100 in the mine and about 50 in the works; wages, about the same as the Crown mine. The depth of the mine is 540 feet on the dip of the vein.

MANITOBA.

ARGYLE.—The machinery for the stamp-mill constructed by Fraser & Chalmers has arrived, and will be put up shortly.

LAKE OF THE WOODS.—The run of gold-bearing quartz known as the Bulldog, which is the property of this company has lately been uncovered and found to be over eight feet in thickness. The ore has been tested and yields a very high percentage of gold. The sinking of a shaft has been commenced. The prospects are encouraging, as the ore gets richer the deeper the mine goes down.

WINNIPEG CONSOLIDATED.—Men are now at work at the company's twenty-stamp mill. It is proposed to begin crushing ore as soon as possible after the opening of navigation. The shaft has been sunk to a greater depth lately, and the vein of ore is widening and getting richer the farther the shaft descends.

NEW COMPANIES.

The following companies have filed articles of incorporation:

Canadian Prospect Mining Co. Capital, $1,000,000; shares, 20,000. The object of the company is to purchase mines and minerals. Incorporators: Lewis Carvell, of Hampton; Charles Hevildes and Amos Henry Chandler, of Moncton; Charles C. Foster, of Boston; and J. E. Carvell, of Charlottetown. Principal office, Moncton, N. B.

Marmora Gold and Iron Co. Capital, $800,000.

Saint Joseph Petroleum Co. Capital, $10,000; shares, 4000. The object of the company is to buy, lease, and sell oil and minerals of all kinds. Incorporators: Rufus S. Merrill, Joshua Merrill, J. Porter Waitt, S. Payson Bradley, Edward E. Allan, Henry Robbins, Frederick Robbins, H. S. Morse, all of Boston; Charles Newell, of Newtonville, Mass.; John S. Fish, and Freeman W. Wisdom, of St. John; and John B. Elliott, of Moncton. Principal office, Dorchester, N. B.

COLORADO.

CHAFFEE COUNTY.

ROYAL GORGE SMELTING COMPANY.—This company has bought the Cañon City smelter, and those works will be enlarged and put in operation at an early day. A ninety horse-power turbine-wheel will be put in, to furnish the necessary power.

CLEAR CREEK COUNTY.

SNOWDRIFT.—After connection had been made with the Thompson shaft, about midway between the Snowdrift and Good Hope levels, a new level was started toward Good Hope Gulch, which at forty feet in began to disclose black sulphurets and other mineral running as high as 800 ounces and over. A cross-cut was run north at the east end of ths Snowdrift level to a vein supposed to be identical with the Good Hope lode above. Here the rock has been chambered out and a lease let to sink 75 feet, and then at 60 feet drift 100 feet easterly preparatory to stoping to the level above, which meanwhile will be run ahead. Assays from this chamber have yielded 840 ounces.

GILPIN COUNTY,

COLUMBIA TUNNEL.—This tunnel is designed to cut the Columbia, Colorado, and Burroughs mines on Quartz Hill. As soon as the contract for driving the tunnel—now in quite a distance—is let, work will be resumed. According to estimates of the course of the veins, and present tunnel heading, it is thought that the Columbia and Colorado will soon be reached.

DUTCHMAN.—This company has completed sinking the working-shaft 30 feet, which gives it a depth of nearly 200 feet.

HASELTINE.—Two shafts are sinking east of the pump-shaft. The latter has been cleaned out and workmen are now engaged in putting in a 12-inch Cornish pump, when sinking will be resumed, drifts driven and stoping inaugurated. The concentration mill of the company recently treated a quantity of waste or dump material from the mine.

HINSDALE COUNTY.

ULE.—The concentrator has started up and works satisfactorily. By this process the slime, instead of being carried directly into the stream, thereby losing the gray copper and lighter mineral, is carried back upon puddling-tables, effecting a great saving. Low water is interfering with steady runs, but as one engine is now in place and another will be next week, it is expected that the mill will run steadily.

LAKE COUNTY.

Late Leadville exchanges contain the following:

EVENING STAR.—This mine will begin shortly making its customary large shipments. The output of the mine for a number of weeks past has been kept at a minimum, owing to the sinking of the main shaft. This shaft has now attained a depth of 330 feet, and has encountered so much water that it is impossible to go ahead with the work in the absence of pumping machinery. The main shaft passed through the principal ore-body in the Evening Star mine at a depth of 180 feet. Since leaving the body of ore, the shaft has encountered no limestone, but has penerated a great mass of gray porphyry, and stopped in a magnificent body of iron ore, two feet below the plane of the contact. While the sinking of this shaft will not be continued to any greater depth now, the iron body will be prospected more extensively, driving drifts just above the water-line. The farther exploration of the lower iron body is also to be prosecuted from the upper shaft of the Evening Star, located three or four hundred feet east of the main shaft. The upper shaft has a depth of 380 feet, and is less extensively used in the hoisting of ore, consequently better suited for development-work.

MIKE & STARR.—Work is vigorously prosecuted. The new pumps are doing excellent work. The mine is expected to resume large shipments of ore shortly.

MORNING STAR.—The ore yield at present averages seventy tons a day. The Lower Waterloo workings are showing great quantities of ore, and promise to be equal to any draft that may be made upon them. The incline from the Waterloo shaft has now advanced about three thousand feet, and has opened large ore resources on both sides. A level driven to the south, from which a prospect-drift is driven, shows three feet of fine ore, about twenty feet directly ahead of the face of the incline. On the north side of the incline, another breast of ore has been opened, having a thickness of four feet. The McHarg shaft has attained a depth of 112 feet. This shaft is to strike the first iron at about 200 feet, and the incline advancing from the Waterloo shaft at between 425 and 450 feet. The shaft is amply large to accommodate the heaviest pumping machinery, and is designed to admit of sinking it if neces-

Digitized by Google

sary to a depth of one thousand feet. The main and upper Waterloo shafts are also working and contributing largely to the output of the mine. The ore is all of very fair grade.

REBEL-MINNIE.—This property has been actively worked for over a month past, is showing considerable fine ore, and making some ore shipments.

SILVER CORD COMBINATION.—Seven electric lamps have been put up at this mine.

YANKEE & BREECE HILL.—The property worked on tribute. The Keystone is said to show a carbonate of lead ore in the three different drifts, ranging in value from fifteen to fifty per cent in lead and ten to sixty ounces in silver to the ton. The vein or ore-chute is improving very rapidly, and still higher grades of ore are anticipated.

NEW COMPANIES.

The following companies have filed articles of incorporation :

Atlantic & Pacific Mining and Smelting Co. Capital $100,000. Operations, Summit County, Colo. Directors: Albert Sherwin, Arthur R. Brown, and James N. Templar. Principal office, Leadville.

Colorado Queen Mining and Tunnel Co. Capital, $1,000,000. Directors: Maria Darrah, Minnie Reimers, Mary A. F. Purcell, and Mamie Nelson.

Grace Mining and Milling Co. Capital, $500,000. Operations, San Juan County, Colo. Incorporators: H. Kauffman, S. R. Carpenter, D. R. Kinsell, W. Y. Miles, F. W. Lobdell, F. F. Miller, and H. O. Montague.

Jennie B. Silver Mining and Milling Co. Capital, $300,000. Operations, Summit County, Colo. Directors: J. H. Carle, W. W. Carle, L. J. Carle, W. C. Brett, and Stanley Stokes.

Rebel-Minnie Mining Co. Capital, $120,000 ; shares, 1200. Operations, Lake County, Colo. Directors: C. I. Thompson, Daniel Sayers, P. J. Sours, C. C. Kellogg, John B. Henslee, and John W. Virgin.

Southern Colorado Bismuth Silver Mining Co. Capital, $2,000,000. Operations, San Juan County, Colo. Principal Office, Silverton.

Thompson Valley Coal and Mining Co. Capital, $6000 ; shares, 600. Operations, Larimer County, Colo. Incorporators: C. C. Bushnell, O. D. Shields, E. S. Allen, Frank Harrison, and Lewis Cross. Office, Loveland, Colo.

Washington Gulch Mining and Reduction Co. Capital, $1,000,000. Operations, Gunnison County, Colo. Directors: James S. Delano, D. A. McKnight, and James H. Lowe. Principal Office, Washington, D. C.

Waterloo Mining Co. Capital, $5,000,000. Operations, Lake County, Colo. Directors: William Tremble, John J. McGowan, James Gibbin, W. H. Mathews, and Timothy Broon. Principal Office, Leadville.

DAKOTA.

A recent dispatch from Deadwood says that the intensely cold weather has closed many ditches, causing the hanging up of many stamps and threatening the closing down of all the mills. The stamps of the Golden Star mill have been hung up, and the Highland mill will probably stop.

CALEDONIA.—The superintendent reports for the week ended January 7th : Ore produced, 975 tons. Shipped 795 ounces of gold, value about $13,500. South header advanced 4 feet ; total, 34 feet. North drift advanced 9 feet ; total, 51 feet. The winze is down 8 feet, all in ore of good quality. Stopes are all looking well and furnishing ore enough to keep the mill running to its full capacity.

FLORENCE.—The mill is running successfully.

SITTING BULL.—The smelter will remain closed until spring.

IDAHO.

PENOBSCOT—Ore has been struck in tunnel No. 3, the lowest workings in the property, and at a depth of 150 feet from the surface. The heading had been in ledge matter for over 100 feet, cutting through fine-looking vein matter, but recently ore appeared in the breast. It proved to be only a stratum three inches thick, but this was followed by two other strata of like thickness, and the mere finding of ore at that depth is held to be an exceedingly promising indication.

MICHIGAN.

NEW COMPANIES.

The following companies have filed articles of incorporation :

Agogebic Exploring, Mining, and Manufacturing Co. Capital, $500,000 ; shares, 20,000. Operations, Ontonagon County, Mich. Directors: G. M. Wakefield, Edward Aschermann, Henry Fink, Walter Kempster, Richard Gunther, and P. Mitchell. Principal office, Oshkosh, with a branch office at Ontonagon.

Ellsworth Iron Co. Operations, Michigan. Directors : Norman McLeod, Daniel H. Ball, Henry Shouldice, James Trembath, and I. A. Pool.

Junietta Mining Co. Operations, Michigan. Officers : Edward Breitung, President ; George Runkel, Vice-President ; Frank E. Pierce, Secretary ; Lazarus Silverman, Treasurer.

Longyear Iron Mining Co. Capital, $50,000. Operations, Felch Mountain District. Officers : George H. Hammond, President ; George O. Robinson, Vice-President ; Bryant Walker, Secretary ; Elisha Flinn, Treasurer ; J. M. Longyear, General Manager.

North Felch Iron Co. Capital, $500,000. Operations, Michigan. Incorporators : Vine C. Watkins, Seymour Coleman, J. M. Longyear, Julian M. Case, and C. H. Colton.

Wheeling Mining Co. Capital, $500,000 ; shares, 20,000. Operations, Michigan. Officers : Daniel McGarry, President ; John Q. Adams, Secretary ; Thomas Axworthy, Treasurer ; James F. Foley, General Manager.

MINNESOTA.

NEW COMPANIES.

The following companies have filed articles of incorporation :

Minnesota Iron Co. Capital, $10,000,000 ; shares, 100,000. Operations, Vermillion District, Minn. Incorporators : Charlemagne Tower, of Philadelphia ; Edward Breitung, of Negaunee ; George C. Stone, of St. Paul ; Charlemagne Tower, Jr., of Philadelphia ; Richard H. Lee, of St. Paul.

MONTANA.

The Butte *Inter-Mountain* gives the following statement of the production of Summit Mining District for 1882 : Alice Company, $850,000 ; Moulton Company, $406,920 ; Silver Bow Company, $408,473 ; Lexington Company (three months' run), $340,000 ; Dexter mill (Anaconda Company), $100,000 ; Colorado & Montana Company, $865,000 ; Montana Copper Company (matte), $1,458,000 ; Montana Copper Company (ore), $520,400 ; Bell Company (January to June), $324,00 ; Parrot Company, $1,575,000 ; Longmaid concentrator, $127,000, Total, $6,884,793.

CABLE.—The ore now taken out averages in assay value from $60 to $75 per ton, exclusive of the gold nuggets which are frequently found in profusion, and of all sizes. Two weeks ago, a piece of ore was extracted weighing about 150 pounds, and estimated to contain $6000 in native gold, most of it in nugget form. At present, only fifteen of the thirty stamps are in operation, owing to the scarcity of water, but these stamps are daily crushing ore valued at $100 per stamp. As soon as the water supply can be increased, the daily product of the mill will be $3000.

NEVADA.

ALBION.—The report presented at the annual meeting, held in San Francisco recently, shows that the principal litigation of the company with its opponent, the Richmond Mining Company, which has been going forward for some years, has, upon every point, been decided in favor of the Albion. The Rose case is in the United States Supreme Court at Washington, where it will be reached probably in 1885. The other minor suits are in progress in various courts, and the president has no fear of the results. The cost of litigation has been about $116,000. The report also gives quite fully the reasons that induced the board to construct its own smelting-works at the mine, and states as a definite conclusion that, based upon the expenses in sending some 1700 tons of ore to the Eureka furnaces for smelting, and the result derived from smelting its own ore at its mine in its own furnace, the company saves by the latter process some $17 per ton of ore, or, estimating the monthly capacity of both furnaces at 2500 tons per month, will save some $42,500 per month. The only source of revenue upon which all this work has been done since June last has been from an assessment of 25 cents per share, which was absorbed by prior liabilities, and some $40,000 derived from the ore sent to the Eureka Company. The financial statement shows the following :

RECEIPTS.

Balance from last yearly statement		$4,945.58
Assessment No. 9, levied November 25th, 1881, of 30 cents—balance		3,600.00
Assessment No. 10, levied March 6th, 1882, of 30 cents—amount		44,995.80

	$250,013.46

ARGENTA.—This company has purchased a half-interest in the Grand Prize mill for $50,000.

THE COMSTOCK LODE.

The report that the Comstock miners have agreed to a reduction of wages to $3 per day above the Sutro Tunnel level is denied by officers of the Miners' Union.

GEDDES & BERTRAND.—According to the Eureka *Sentinel*, the mill is reducing about 54 tons daily, the average assay value of which is 28 ounces, for which they got in December $1.13⅝ per ounce, or about $32 per ton. The principal work now going on in the mine is on two uprises from the 75-foot level. These uprises are 150 feet apart where started from the level ; but the ore being followed in them, separated by a formation of black lime and quartzite, they are found making toward each other. Both reveal large bodies of ore, bright yellow sulphurets or antimonial silver, that goes $60 per ton. The indications are, that these uprises will come together about 60 feet from the surface, from which point up to the grass-roots the ore, it is expected, will be found in a continuous body. Plenty of good ore, also, on the 300. Important work is doing on an incline 180 feet in extent, going down at an angle of 45 degrees, from the 150 level. It looks more and more, as developments progress, as if the tremendous body of ore in the Geddes & Bertrand extends in one body from the surface down to the 300 level and indefinitely deeper. The ore taken out is not assorted with much care, loss of time, or expense. It is the intention to utilize all rock that contains the precious metal—silver, there being but little gold in the mine—which accounts for the average value of the ore reduced being about $30 per ton.

NAVAJO.—The winzes sinking from the 350 to the 450 level continue in good ore.

NEW JERSEY.

NEW COMPANIES.

The following companies have filed articles of incorporation :

Mutual Iron Ore Co. Capital, $100,000. Operations, Morris and Passaic Counties, N. J. Officers : Grinnell Burt, of Warwick, President ; G. Hobart, of Paterson, Treasurer ; and Joseph Cunningham, of Greenwood, Secretary.

NEW MEXICO.

SUPERIOR.—A body of high-grade ore was struck in this mine, near Kingston, recently. The shaft had been sunk sixty-five feet and a drift run into the hill to the south about fifty feet, finding some good ore, but not in such quantities as anticipated.

OHIO.

NEW COMPANIES.

The following companies have filed articles of incorporation :

Arizona Buttes Mining Co. Capital, $7,500,000. Office, Sandusky.

Howell's Coal Co. Capital, $60,000. Office, Massillon.

Jacksonville Coal and Coke Co. Capital, $250,000. Office, Jacksonville.

Williams Mining Co. Capital, $50,000. Operations, New Mexico. Incorporators : Messrs. Richard Brown, John T. Williams, John Besore, Anthony Welsh, and Richard B. Tate.

PENNSYLVANIA.

NEW COMPANIES.

The following companies have filed articles of incorporation :

Hillman Vein Coal Co. Capital, $200,000. Office, Wilkes-Barre.

Yguana Smelting and Mining Co. Operations, Mexico. Dr. W. S. Forbes, President ; Francis Heyl, Secretary and Treasurer.

TEXAS.

From a report made for the Fort Worth & Denver City Railroad, we learn that at several points along the road there are fine outcroppings of copper, and the report states that investigation would doubtless discover fine deposits of that metal. The copper is in beds parallel with the Permian strata of the country, which lie almost horizontally. The copper ore lies imbedded in a stratum of blue clay, between sandstone, in the shape of disulphuret of copper.

FINANCIAL.

Gold and Silver Stocks.

NEW YORK, Friday Evening, Jan. 26.

The mining market has been quite active this week, but records no new or interesting features. The Pipe Line Certificates have monopolized most of the business at the New York Board, although a good business has been done in some mining stocks. The Comstock shares have been dull, but show a tendency to better prices. The Leadville stocks show no improvement, but have held their own. The Tuscaroras have been almost the only exception to the general apathy, and have shown considerable activity at very strong prices. We give a summary of the market below. The total number of mining shares sold at all the Exchanges aggregates 454,373 shares, as against 606,100 last week.

The Comstock shares had a moderate business at steady prices. California was quiet and steady at 19 @22@21c. Consolidated Virginia, with a moderate business, was strong, selling from 45@53@51c. Sierra Nevada sold to the extent of 660 shares at $2.85@ $3.10. Mexican had a small business at irregular prices; it sold from $2.38@2.75@$2.50. Ophir has had a fair business and has been steady; assessment-paid shares sold from $2.30@$2.20, and assessment-unpaid shares from $1¼@$1⅝. Consolidated Imperial, under a small business, sold from 2@8c. Yellow Jacket records a small business at steady prices; it sold from $1⅛@$1¼. Best & Belcher was quiet and irregular at $3@$3.75@$3.50. Sutro Tunnel was active and a little weak, selling from 24 @21c.

The Leadville stocks were rather quiet and prices did not materially change either way. Amie was quite active and at steady prices, selling from 17@19 @18c. Chrysolite had a small business at irregular prices; it sold from $1.50@$1.40@$1.45. Hibernia was quiet at 7@5c. Iron Silver records a business of 3100 shares, selling at $2.55@$2.65. Little Chief was very active at steady prices; it sold from 44@41@43c. Little Pittsburg was irregular under a small business, selling from 74@65@69c. Big Pittsburg, with a small business, was a little weak at 20@14c. Climax was quiet and steady, selling at 10@9c.

The Bodie stocks had a moderate business and suffered a slight decline. Bodie sold from $1.90@$1.50, with a business of 450 shares. Standard had a fair business at irregular prices; it sold from $6¼@$5½@ $5¾. Bulwer was also irregular, selling from 91@95c. Goodshaw sold at 5c.

The Tuscarora stocks were active and very strong. Grand Prize had a fair business at strong prices, selling from 47@80@70c. Tuscarora was quiet and strong at 21@20c. Augusta records a small business at strong prices, selling from 45@62c. Belle Isle was quiet and steady at 90c.@$1. Navajo had a small business at irregular prices, selling from $9⅛@$8¾ $9. North Belle Isle was quiet and steady at 60@65c. Independence sold at 67c.

In the miscellaneous list, Alice was quiet and strong at $2.30@$2.50@$2.45. Eureka Consolidated suffered a slight decline under a small business; it sold from $11¼@$10⅝@$10½. The Green Mountain stocks were quiet and steady. Gold Stripe was very active at 8@6c. Green Mountain sold from 47@55@52c. Rising Sun sold at 7@6, and Cherokee at 6c. Hall-Anderson was quiet and a little weak, selling from $1.75@$1.50. Horn-Silver records a moderate business at irregular prices; it sold from $7.50@$7@$7⅞. Hukill was quiet and steady at 18@16@17c. Robinson Consolidated was quite active at very irregular prices, selling from $1.25@$1.15@$1.30. Sierra Grande records an active business at strong prices; it sold from $2.50@$2.80@$2.75.

Alta Montana was quiet and steady at 22c. Bradshaw had a fair business, and was about steady, selling from 39@36@37c. Central Arizona has suffered a decline under moderate transactions, and has sold from 47@40c. Decatur was very active, and has gained some strength; it sold from 9@12@11c. Elko Consolidated continues to be active, but has been very irregular; it sold from 27@20@22c. Lacrosse was quiet and steady at 15@13@14c. Oriental & Miller records a large business, and has been steady, selling at 14@16c. Silver Cliff was quiet and irregular at 40@87c. South Pacific has been active and steady, selling at 9@8c. The State Line stocks have been active at irregular prices. Nos. 1 and 4 sold from 3@4c., and Nos. 2 and 3 from 7@9@8c. Taylor-Plumas has been very active at irregular prices; it sold from 19 @17@18c. Harlem M. and M. Consolidated is a new stock recently listed on the New York Board; it has had a fair business at steady prices, selling from $1@ $1.05.

From the annual report of Vice-President and General Manager Alexander R. Shepherd to the stockholders of the Consolidated Batopilas Silver Mining Company, we learn that from January 1st to November 4th, 1882, the receipts were $229,377.72, and the disbursements $216,796.91, leaving a balance of $12,580.81, represented by $10,275.20 in cash and $2305.61 in silver on hand. The amount of receipts and disbursements from the organization of the company to November 4th, 1882, is: Receipts, $778,314.86; disbursements, $273,823.32; leaving to the credit of the company, exclusive of silver not sold, ores not reduced, exploration-work on mines, and improvements and materials at mines, $504,491.54.

PIPE LINE CERTIFICATES.

Messrs. Watson & Gibson, petroleum and mining brokers, 55 Broadway, furnish the following *résumé* of the oil market for the week:

This week has witnessed a great revival in speculation, heavy transactions and a large advance. During the preceding two weeks, oil vibrated between 85 and 90c. per barrel, with light trading. This apathy and dullness was in part the result of the great fluctuations of November and December, settling down to a

calm, and partly due to the delay in hearing from the Patterson well. This well lies near the border of the Cooper tract, in Forest County, in which was opened during December the Schultz and Reid and Brenneman. This Cooper tract is very spotted, that is, its wells do not uniformly find oil as they do in the Bradford District, and this led to doubts as to the Patterson, especially as it was near the outside limit of the oil belt. However, on Monday last, it was reported dry, though until Thursday no scouts were allowed to visit it. Hence doubts as to whether it was actually dry or a small producer. It is now pronounced absolutely dry, 23 feet in sand.

The following are the fluctuations during the week:

	Opening.	High-est.	Lowest.	Closing.	Sales.
January 20	.89½	.90⅛	.88⅞	.90⅛	69,000
" 22	.90¼	.94¼	.90	.93¾	191,000
" 23	.94	.94¼	.92½	.93⅛	386,000
" 24	.93⅝	.99¼	.93	.99¼	391,000
" 25	1.00	1.05¼	1.00	1.04⅛	714,100
" 26	1.04½	1.05⅜	1.02½	1.03	680,000
Total sales					2,431,100

A special meeting of the stockholders of the Southern Eureka Mining Company was held on Tuesday last, and a committee, consisting of Messrs. S. B. Johnston, John Van Horne, Stephen W. Massett, and the President, were appointed to devise measures to relieve the company of its financial difficulties.

This week, a meeting was held of the stockholders of the Green Mountain Mining Company, at which reports were read and explanations given. We understand that the gross debt of the company is $49,000, against which there are offsets of approximately $8000. The subscriptions to the $35,000 mortgage bonds authorized by the stockholders thus far aggregate $12,000. The bulk of the debt is for the payment of miners' wages.

UNLISTED QUOTATIONS.

REVIEW OF THE SAN FRANCISCO MARKET.

The San Francisco market has been active and steady. The middle Comstocks have advanced slightly under a moderate business. Hale & Norcross and Savage have been in good demand in the market, owing, it is said, to the striking of stringers of ore in the joint drift on the 2600-foot level. The ore assays about $40 per ton. Telegraphic dispatches state that an important strike has been made in Columbus Consolidated, Candelaria, Nev., causing activity in stocks of other mines in the same district.

The Tuscarora stocks have been quiet and have suffered a slight decline.

Copper and Silver Stocks.

Reported by C. H. Smith, 15 Congress street, Boston, Stock Broker and Member of the Boston Mining and Stock Exchanges.

BOSTON, Jan. 25.

There has been a fair degree of activity in the market the past week for the copper stocks, with a decline in the two or three leading stocks, which it is difficult to account for. Franklin, which has been notably strong the past few weeks at $15@$15¼, suddenly declined on small sales to $13. We hear no reason assigned, as all reports from the mine are favorable, and the prospects for a dividend at an early day are very promising. The stock later rallied to $14, and closed to-day at $14 bid. Pewabic was also weak, and declined from $10@$8; later, $8½ bid. There are rumors of another assessment at no distant day, but we are unable to trace them to any reliable source. Quincy advanced early in the week from $59½@$62 regular, and $62½ buyer 60 days; but on the announcement of a dividend of $6 per share, the stock, strange to say, declined to $59, but subsequently rallied to $60, and closed at $59¾. Osceola declined on small sales to $31. Atlantic, sales at $16. Allouez, $2.60. Huron, $2@$1⅞. Copper Falls, $2. Brunswick Antimony, $15.

The market for silver stocks has ruled dull and lower. Catalpa declined to 95c.; later, advanced to $1@1.02½. Bonanza, dull at $2¼. Silver Islet declined to $6. Sullivan sold at $1. San Pedro rather active, and advanced from 40@60c.

At the Boston Mining and Stock Exchange, Massachusetts & New Mexico declined from 23@18c. Empire, steady at 29@30c. Deer Isle, 13@11c. Twin Lead, 25c. San Pedro, 50@58c. Pipe Line Certificates have been freely dealt in at 89¼@94½c.

3 P.M.—The market was dull and inactive this afternoon. Allouez sold at $2.60. Catalpa, 95c. San Pedro, 60c. Calumet & Hecla, $246 bid, $247 asked. This stock has been unusually quiet the past week, only 15 shares changing hands at $247. Quincy, $58 bid, $60 asked. Franklin, $14¼ bid. National, $1⅛ bid. Pewabic, $8¼ bid. Huron, $1⅞ bid. Atlantic, $15 asked. ex dividend, $1 per share Silver Islet, $5 bid.

BULLION MARKET.

NEW YORK, Friday Evening, Jan. 26.

The exchanges on India have strengthened the silver market in London, and it may be regarded as firm at the figures of the annexed table:

DATE.	London Pence.	N. Y. Cents.	DATE.	London Pence.	N. Y. Cents.
Jan. 20	50¼	109⅜	Jan. 24	50⅜	109⅛
Jan. 22	50 3-16	109¼	Jan. 25	50⅜	109⅜
Jan. 23	50¼	109⅜	Jan. 26	50⅜	*

* 109⅜@109¾.

Bullion Receipts at New York.—The bullion received from the mines at the various offices in this city during the week ended January 26th, as compiled from various sources, amounted to $260,320.97 as against $251.836.94, reported for the previous week. The receipts from January 1st, 1883, to date, are $1,383,614.78.

Exports and Imports of Gold and Silver at New York.

Exports.

Week ended January 20th	$274,250
Corresponding week last year	494,741
Since January 1st, 1883	807,069
Corresponding period last year	832,280

Imports.

Week ended January 20th	$53,395
Corresponding week last year	27,020
Since January 1st, 1883	159,032
Corresponding period last year	291,367

Foreign Bank Statements.—The governors of the Bank of England, at their weekly meeting, reduced the bank's minimum rate for discounts from 5 to 4 per cent. During the week, the bank gained £553,000 bullion, and the proportion of its reserve to its liabilities was raised from 40⅝ to 44⅛ per cent against 38 15-16 per cent at this date last year. January 25th, the bank gained £34,000 bullion on balance. The weekly statement of the Bank of France shows a increase of 4,875,000 francs in gold and of 280,000 francs silver.

IRON MARKET REVIEW.

NEW YORK, Friday Evening, Jan. 26.

The iron and steel trades are severely suffering from the suspense attending the deliberations of the tariff question, and importers, as well as producers, are longing for a settlement, and will be satisfied whatever it may be, if it is only done speedily. No one thinks of entering into the large contracts for many months' supply which are usually made at this

Digitized by Google

ime of the year, and consumers are running along rom hand to mouth, while the stronger producers are uietly holding on.

The following will explain itself :

The Associates of the Iron and Metal Exchange Company, Limited, desiring to place on record their appreciation of the value of the life of one whom death has taken away, do adopt the following resolutions :

Resolved, That, in the death of John Williams Quincy, the iron and metal trades have lost one of their most respected and useful members.

Resolved, that the members of this Exchange do sincerely regret the close of Mr. Quincy's long and honorable career, conspicuous in business, in social life, and in many charitable works ; and they regretfully tender to the firm and family, who have been deeply bereaved, the assurance of their heartfelt sympathy.

B. F. JUDSON, Chairman.
WILLIAM ALLEN SMITH, Secretary.

Mr. John Quincy was born in Portland, Maine, entered the hardware business in Boston, and in 1835 came to this city. In 1837, he commenced business under the style of Davenport & Quincy, now John W. Quincy & Co.

American Pig.—Business drags along, with the standard grades of foundry pig tolerably firmly held, while inferior qualities are offered at lower figures, to meet the falling markets of Scotch pig. Standard to choice Foundry remains unchanged at $24.50@$26 for No. 1 ; $22.50@$23.50 for No. 2. Gray Forge, of which we note a sale of 3000 tons at private terms, is weaker. We quote $20.50@21. There is no change in Bessemer pig, which is nominally $22.50@$23. England cables to the Wall Street Exchange for equal quantities of Nos. 1, 2, and 3, 52s.6d@55s. Spiegeleisen is dull at $33@33.50 for 20 per cent ; $29.50@$30 for 15 per cent ; and $27@$28 for 10@12 per cent.

Scotch Pig.—The market continues exceedingly dull and weak. Arrivals have been 1500 tons, and sales do not aggregate 700 tons at private terms. Freights are as low as 4s. from Glasgow to New York. We quote Coltness, $25@$25.50; Summerlee, $23@$23.50; Glengarnock, $22@$22.50 ; and Eglinton, $21@$21.50. At the Wall Street Exchange the cables are a trifle lower, as follows : Carnbros, 55s.; Gartsherrie, 63s. 6d.; Summerlee, 62s.; Coltness and Langloan, 66s. 6d.; Glengarnock, 56s.; and Eglinton, 50s.; Warrants are 48s.

Steel Rails.—Beyond a few sales at steady figures for immediate delivery, there is nothing to report. We quote for small lots $40 at mill. London cables £4 15s.@£5.

Old Rails.—We hear of no business, and quote $23¼ bid and $25 asked for Ts.

Scrap.—With little inquiry, the market remains unchanged at $24.50@$25 ex ship.

Philadelphia. Jan. 26.

Pennsylvania markets show a slight improvement in demand, but prices are still at the low limits of the past month. Consumers have found it necessary to provide for urgent requirements. Some of the larger consumers have discounted the probable action of Congress, and believe either the Tariff Commission's bill will be embodied in the law, or, if not that, the debate will be postponed to a re-convened session, or over to next winter. The sentiment of the protectionists in and out of Congress is, that if the Tariff Commission's suggestions can not be embodied in law, the question will go over. There is a very bitter contest going on, d it is impossible to predict even any probable re-

Buyers are holding back as far as possible, and aking purchases for limited requirements. Weak olders have unloaded in some cases largely at $24.50 for inferior No. 1 Foundry, while better grades are held at $25@25.50. The accumulation referred to heretofore is going on at furnaces, though not to a degree which is likely to weaken prices in the future. A careful canvas among large consumers indicates a steady consumption at about old limits, and hence makers are confident that the demand which is to come during February and March will leave them at the opening of spring with nothing on hand and with better quotations than rule to-day. No. 2 iron has sold at $22.75@$23, and up to $23.50, with one or two brands held higher. Gray Forge iron is selling at $20 @21.50 delivered, and a few buyers have bought quite freely at inside quotations. Strong companies are not disposed to crowd down prices any further, for the double reason that there is, first, no necessity for it, and second, no room for it. The entire situation is surrounded with a good many uncertainties, but the enactment of a law will remove most of them, and very probably lead to a revival of the demand which has been held in check for almost two months.

Bessemer Iron is hanging between $22 and $22.50. Scotch iron is in better demand, and a number of founders have been stocking up with a few weeks' supply. English iron is quoted at $20@$21 ; but one to three thousand ton lots have been offered in this market at $19, and even less it is thought would be accepted.

Blooms.—Charcoal Blooms are selling between $65 and $67. Small orders from 10 to 50 tons are booked. Anthracite Blooms are selling from $55@$56, and the productive capacity is absorbed.

Sheet-Iron.—Sheet-iron is selling from 4@4¾ for gauges 16 to 28. Refined is in fairly active demand, though there is not that pressure for stock which has existed for months past. Manufacturers look for an unusually active spring demand, and are endeavoring to stock up for it.

Merchant Bar is selling at card rates in store, 2·40, though 2·30 is the average price quoted for large orders. The consumption going on is very large, and there are indications that, as soon as the tariff question is disposed of, requirements for two months at least will be covered. Competition between the East and the West is inactive, and country mills are booking orders from 2·25@2·35 for Refined and 2·10@2·20 for Common. Boat Plate and Tank iron is 2½@2·6. Skelp iron is 3·40.

Wrought Pipes are 65c.@67½c. off. Inquiry is improving. Boiler tubes are 55c. off, and a better demand is at hand but for small lots only.

Structural Iron is quiet and weak at 2.5@2.6 for angles; 3½ for Ts; 3¾ for Beams. The probable requirements for the current year will be fully as heavy as last year, and hence there is no anxiety among manufacturers, except that the uncertainties now surrounding the trade in consequence of tariff agitation be removed as soon as possible. Prices have declined about as much as they probably will, but consumers are not attracted into the market, though it would seem that now is a good time to buy.

Steel Rails.—Steel rails are quoted at $40@$42, according to size of order. The large buyers are doing nothing, and are waiting for developments. Small buyers are coming around for 500 to 1000-ton lots. The feeling is decidedly better than a month or so ago. The low prices then prevailing will not be named again. The probabilities are that lake ores will sell one or two dollars lower than last year, although contracts are not yet closed. Western markets are affected by the same causes which are operating East ; but the undertone is good and the outlook is favorable for a revival of demand in early spring. Steel for tool and machinery purposes is in moderate demand, and prices are low, Old rails are quoted at $25 for Ts; $28 for double-heads.

METALS.

NEW YORK, Friday Evening, Jan. 26.

Copper.—The market for Lake is steady, first hands asking 18½c., though probably direct offers from consumers would elicit lower figures. In a small way, Lake changes hands at 18@18¼c. In other grades, there are growing signs of weakness, some parties evidently forcing sales. Baltimore can be had for 16½c., and it is rumored that other brands have been offered at considerably less. London has fallen off to £65 15s.@£66 for Chili Bars, Best Selected remaining steady at £72@£72 5s.

Tin.—Under a moderate business during the week, the market is firm, closing at 21¼@21⅜c. London cables to-day, £93 5s.

Lead.—Absolutely nothing has been done in a large way. The state of our market is well characterized by the fact that a lot of 280 tons of common and 180 tons of selected Germania lead which had arrived by vessel from San Francisco, did not bring out bids higher than 4·60c. for the Common and 4·62½c. for the Refined. The lead went into store. London cables £13 10s.@£13 15s.

Messrs. John Wahl, of St. Louis, wire us as follows to-day :

The demand is only moderate, and there is but very little doing. There are more sellers than buyers in the market, and therefore prices are weak. We quote Soft Missouri 4·30c. and Hard lead 4·25c.

Spelter.—This metal is hard to sell, and there is very little doing at 4⅝c.@4¾c. London cables £16 5s. @£16 10s.

Antimony.—Antimony has drooped again. We quote Hallett's 10⅛c. and Cookson's 11¼c.

COAL TRADE REVIEW.

NEW YORK, Friday Evening, Jan. 26.

Anthracite.

The market is dull and in an unsettled condition. Recently the leading companies issued private circulars announcing a heavy reduction from former nominal rates, but really coming nearer the ruling rates. This action did not serve to have the desired effect, and it is pretty generally understood that even these private prices are heavily cut. There is a growing feeling of distrust among the companies, and we have good evidence that there is ample cause for it. Unless some measures are taken to put an end to this fighting below board, the consequences may be serious, and may lead to a break injurious to all interests. Consumers, meanwhile, are wisely buying only from hand to mouth, a policy which they will not be likely to abandon until they have good cause to feel certain that there will be no open rupture among the trading producers. The local demand is not great temporarily, although yard stocks are running low. On the other hand, some of the companies are carrying accumulations of coal which are pressing on the market. Other companies are well situated in this respect, but have an inclination to fight for their share of current business, particularly for domestic consumption.

The encouraging features in the market are the prospective heavy demand by mill owners in the East, and the inroads upon Western stocks, due to the severe weather in that section.

The production of anthracite for the week ended January 20th was 343,831 tons, as compared with 570,687 tons the previous week, and 364,557 tons for the corresponding week of 1882. The total product from January 1st to January 20th was 1,341,908 tons, as against 1,315,828 tons for the like period of last year, showing an increase this year of 26,080 tons.

Bituminous.

There is an active competition for what trade there is. In Philadelphia, the ice blockade is breaking up, and there is a prospect of larger shipments from that quarter. We quote alongside, Clearfield, $4.55@$4.70, and Cumberland, $4.65@$4.80, according to quality.

STATISTICS OF COAL PRODUCTION.

Comparative statement of the production of anthracite coal for the week ended January 20th and year from January 1st :

TONS OF 2240 LBS.	1883.		1882.

VIENNA is to have an International Electric Exhibition, to be opened on the first of August this year, and to last three months. Applications for space will be received at the office of the Managing Committee, Wallfischgasse 9, Vienna, until March 1st, and space will be allotted on May 1st. The plan is a very comprehensive one, and the rapid progress of the applications of electricity since the Paris Exposition makes a very interesting and instructive show highly probable.

THE week has been one of no particular interest in tariff matters. The House of Representatives has fairly launched into a discussion of its own bill, has disposed of the general features of it, and has got to work on the first schedules, iron, steel, and the metals not having been reached as yet.

In the Senate, a duty of $18 per ton was substituted for 9 cents per pound for flat bar iron, $20 per ton for 1¼ cents per pound for round, and $22 per ton for smaller sizes of flat and round bar. Boiler suffered a reduction to 1¼ cents per pound, and sheet-iron came down from a range of 1·5 to 1·7 cents per pound, according to gauge, to 1·2 to 1·5 cents, Russia iron being reduced from 3 to 2½ cents, and tin plates to 1 cent per pound. Hoop, band, and scroll were cut down on the basis of 1 cent for No. 10 gauge and over. The proposition to put cotton ties on the free list was rejected. Wire rods passed unchanged, but the addition of one half of one cent to the duty on iron and steel or articles galvanized was cut down one half and wire excluded.

MR. EDWARD ASHMEAD, of London, has computed a table of the mining companies registered in England during 1882. According to his figures, it would appear that 37 companies were organized to work British metalliferous mines, with a nominal capital of £1,811,800; 33 companies to work coal and iron mines, with £1,503,000 capital; and 22 for quarrying clay, slate, granite, etc., with £694,000. In addition, British capital became interested in 15 mines in other countries in Europe, capitalized to the extent of £1,116,000; three only in Asia, with £175,000; seventeen in Africa, chiefly gold mines of the West Coast, with £1,335,000; and three in Australia, with £140,000. The greatest interest, judging from the number of companies formed and their nominal capital, was taken in American mines, and in these the United States take a leading part. Out of the total of twenty-five companies credited to North America, twenty are situated in this country, and their aggregate nominal capital is £3,118,000, out of a total of £3,433,900. Colorado seems to be the favorite, the list figuring up to £1,623,000, and including the Astor, Belcher, Colorado, Crooke, Denver, Henriett, London & Silverton, Puzzle, San Miguel, Silver Cord, Sleepy Hollow, and White Star.

In South America, Colombia and Venezuela divide between them nearly all the new enterprises of 1882, with a nominal capital of £2,352,100. India has dropped off as rapidly as it rose. In 1879, one company was registered with £100,000 capital; in 1880, twenty-three, with £3,732,500; in 1881, twenty-one, with £2,525,600; and in 1882, only one, with £60,000.

THE STEAM AND GAS PIPES IN THE STREETS.

Some weeks ago, we pointed out the defects in the plan of one of the companies (the American) undertaking to distribute through the streets of this city steam for heat and power. Our criticism was confined to features of construction which rendered large leakage of steam inevitable. Two other evils connected with this company's pipes have since made themselves unpleasantly apparent. The first is the foul odor proceeding from the use of soot as a packing; the second is the liability to explosions from gas collected in the manhole-chambers of the company.

The justice of our former observations is shown by the action of the company itself, in shutting off the steam from its pipes, for the avowed purpose of correcting defects in their construction. General NEWTON, whose high reputation has been hitherto used as a guaranty of the technical excellence of this construction, is now reported to say that, though "Consulting Engineer," he was not consulted as to these details. The Public Works Department makes haste to disavow responsibility for the manner in which the work was done. The directing engineer has resigned his position. Altogether, the confession of failure is complete.

Some time ago, there was a legislative inquiry into the Public Works Department. It is popularly supposed to have been a demonstration of Tammany Hall against the County Democracy, and to have carried a demand by the former for a share of the patronage controlled by the latter. The investigation was allowed to drop, and it is supposed that this result was due to the success of that demand. But while the inquiry continued, it developed the fact that several hundred contracts had been given by the department to one man, without previous advertising, the amount of each being less (often but barely less) than $1000, the limit fixed by law for such letting of contracts. The action of the Commissioner had therefore not been illegal; but the result has been to give to a single party a large amount of business without competition. This showed extraordinary confidence reposed in that party, to put it mildly; and when we add that the same individual is reported to have been the contractor who laid the pipes of the American Company, the suggestion is natural that this extraordinary confidence was extended to his operations there, and that, as competition was not deemed necessary in one case, supervision was considered equally superfluous in the other. If it be true that the ground of the confidence referred to was chiefly political, the whole business is a warning to politicians, and an argument for municipal civil service reform.

It is a noteworthy fact that the gas explosions in the manhole-chambers of this company occurred only after steam had been shut off. We think the following a probable explanation: As we have shown in a former article, the company provided for the expansion and contraction of its pipes by means of stuffing-boxes at the street corners. Each of these had to be inclosed in a chamber of masonry, large enough to permit a man to descend and work at the stuffing-box when it leaked. These chambers became very hot. Every body noticed, during the recent storms, that snow melted at once on the surface over them. The pipes of the gas company near them would naturally be expanded by the heat. But in some cases, we are told, the steam company, following its plan of cheap construction, actually built around the gas-pipes, so that the latter passed through the chamber. Of course, in such cases, they were directly exposed to heat.

Now, the gas company, not foreseeing the advent of such warm neighbors, had provided no expansion arrangements—not even stuffing-boxes

Digitized by Google

—and the expansion of its pipes would naturally affect their joints. Yet it is likely that large leaks were not caused until, by the withdrawal of steam from the American pipes, the chambers were allowed to cool, and contraction took place, pulling open the joints of the gas-pipes. This permitted the collection of gas and its mixture with air in the chambers at a temperature too cool to cause immediate ignition—the most fatally favorable conditions, as every mining engineer knows, for a disastrous explosion.

Whether this evil can be prevented without an almost entire reconstruction of the steam company's system, is questionable. The plan necessitates the carrying of highly superheated steam (a piece of thermodynamic foolishness anyhow, since saturated, not superheated, steam is the best conveyer of heat for such purposes); and the pipes must therefore be hot. Whether the chambers can be filled with something equivalent to the mineral wool employed by the New York Company, and thus can be made to offer no spaces for the accumulation of gas, remains to be seen. But it will be useless to fill up the chambers without doing something to prevent the heating of the gas-pipes. *

THE FLUCTUATIONS IN THE PRICE OF SILVER.

Since September last, the price of silver in this and the London markets has been the subject of much attention, the quotations falling in the course of four months two pence in London and fully six cents per ounce here. The year 1882 opened with silver at 51 11/16 pence in London and $1.12 3/4 here, and toward the close of January last reached $1.14, above which figure it remained till March 14th, when it temporarily receded to $1.13 7/8. It rallied again, and on May 4th had risen to $1.15, with London at 52 3/8 pence. It then fell off, going below $1.14 in the middle of June, but recovering that figure at the end of July. It dropped a little in August, but in the middle of the month recovered to $1.14, and entered the month of September with London at 52 1/16 and New York at $1.14@ $1.14 1/8. Light shipments of silver to the East, and very meager bids for India Council bills, offered at a minimum of 1s. 8d. per rupee, caused a steady decline in September, as proved by the following summary of our daily quotations, for which we are indebted to Messrs. HANDY & CRONISE, of this city:

Date.	London.	New York.
September 1	52 1/16	$1.14 1/4@$1.14 3/8
" 7	52	1.14 1/8
" 11	51 15/16	1.14
" 12	51 7/8	1.13 7/8
" 16	51 3/4	1.13 5/8
" 22	51 7/8	1.13 1/2
" 27	51 13/16	1.13 3/8
" 28	51 13/16	1.13 1/4
" 29	51 11/16	1.13 1/8

At the beginning of the month, a stronger downward tendency developed, owing to the offering of India Council bills at a concession, on October 4th, at 1s. 7 1/2d. per rupee. The market then recovered a little, in consequence of a limited demand for silver from the continent, chiefly Austria; but, as the following summary of changes during the month shows, again fell off toward the close, owing to the pressure of a lower exchange in India, and meager bids for India Council bills at the weekly offerings. The October quotations were:

Date.	London.	New York.
October 2	51 3/4	$1.12 3/4@ $1.12 3/8
" 4	51 5/8	1.12 5/8
" 5	51 5/8	1.12 1/2
" 11	51 11/16	1.12 5/8
" 14	51 11/16	1.12 3/4
" 16	51 11/16@51 3/4	1.12 5/8@ 1.12 3/8
" 17	51 3/4	1.13
" 18	51 13/16	1.13 1/8@ 1.13 1/4
" 21	51 3/4	1.13 1/8
" 24	51 3/4	1.13
" 25	51 3/8@51 11/16	1.12 1/2
" 27	51 3/8	1.12 5/8
" 28	51 3/8	1.12 1/2@ 1.12 3/8

November began with a slight rise, due to orders from the continent; but the decline again set in on the 6th, when India bills were again put down to 1s. 7 3/4d. per rupee; and with increased offerings of these bills and larger receipts from Mexico, due to the removal of the export duty on silver on the 1st inst., the market dropped off steadily. The variations in the quotations were as follows during the month:

Date.	London.	New York.
November 1	51 1/2	$1.12 1/4
" 3	51 3/8	1.12 3/8@$1.12 1/2
" 4	51 3/4	1.12 1/2
" 8	51 1/2	1.12
" 10	51 3/8	1.11 3/4@ 1.11 7/8
" 11	51 5/16	1.11 5/8
" 18	51 7/16	1.11 7/8
" 22	51 3/8	1.11 3/4@ 1.11 5/8
" 24	51 1/4	1.11 1/4
" 27	51 1/8	1.10 5/8@ 1.10 3/4
" 29	51	1.10 1/4

In December, the decline continued until the middle of the month, when purchases on Spanish account caused a slight temporary reaction. The offerings of India Council bills were stimulated by successive reductions, until they stood at the end of the year at 1s. 7 1/16d. It is estimated that of the £15,238,000 to be drawn during the fiscal year from April 1st, 1882, to March 31st, 1883, £8,000,000 remained to be drawn for the first three months of the current year. The rapid decline in December must not be attributed to excessive supplies of silver, the arrivals being fully absorbed by Spanish and Austrian orders. The shipments of silver to East India in 1882 were £4,233,000, against £2,550,000 in 1881; and besides these amounts sent from England, about £2,000,000 of Austrian florins were sent to India via Venice during the beginning of the year. The month of December closed with a demand for the continent and with the acceptance of all bills offered by the India Council. The December quotations were:

Date.	London.	New York.
December 1	50 7/8	$1.10
" 7	50 3/4	1.09 3/4
" 9	50 11/16	1.09 1/2
" 10	50 1/2	1.09
" 11	50 3/8	1.08 3/4@ $1.08 1/4
" 14	50 1/4	1.08 3/4
" 15	50 3/8	1.08 3/4
" 18	50 1/8	1.08 1/4
" 19	50 3/8	1.08 3/4
" 20	50 1/4	1.08 3/4@ 1.08 1/4
" 21	50	1.08 1/2
" 28	50	1.08 3/8

January opened with a more active and an enlarged demand for Eastern exchange, and through the sale by the India Council of a large amount of bills at improved rates, the decline was checked. It then reacted in London; and but for the advance here in sterling exchange, our market too would have shown a considerable decline. Toward the close of the month, the exchanges on India strengthened the silver market in London. The fluctuations during the month were as follows:

Date.	London.	New York.
January 2	50 3/16	$1.08 3/8
" 3	50 1/4	1.08 3/8
" 4	50 3/8	1.09 1/8
" 5	50 7/16	1.09 1/4
" 8	50 3/8	1.09 1/8
" 11	50 1/4	1.09
" 12	50 1/8	1.08 7/8
" 13	50 1/8	1.09
" 17	50 1/8	1.09 1/8
" 19	50 3/16	1.09 3/8
" 20	50 1/4	1 09 3/8
" 24	50 3/8	1.09 1/2
" 26	50 3/8	1.09 3/8@$1.09 1/2

The recent action of the House Committee on Coinage, Weights, and Measures, in rejecting, by a vote of seven to three, a resolution to suspend the coinage of silver, makes it practically certain that no change will be made during this session of Congress in the present rate of coinage, notwithstanding the recent statement by the Secretary of the Treasury that the storage-vaults are practically filled.

CORRESPONDENCE.

[Communications will be noticed only when accompanied with the full name and address of the writer. Unless specially desired, only initials will be printed. We invite criticism and comment by the readers of the ENGINEERING AND MINING JOURNAL. Replies not intended for publication should be addressed to the Editor of the ENGINEERING AND MINING JOURNAL in blank, stamped, and sealed envelopes.]

The Export of Copper from Imported Pyrites.

EDITOR ENGINEERING AND MINING JOURNAL:

SIR: Allow me to call your attention to an error in your issue of January 20th. In your annual review of the metal market for 1882, under the head "Copper," you state that "the copper from imported pyrites is obtained chiefly from Canadian ore, and the bulk is probably re-exported in the form of matte." On the contrary, the entire copper product of the imported Canadian pyrites is eventually handled by the Orford Nickel and Copper Company, and sold entirely as refined ingot copper. Yours truly,

EDWARD D. PETERS, Jr.,
Ass't-Manager O. N. and C. Co.

NEW YORK, Jan. 26.

Rolls versus Stamps.

EDITOR ENGINEERING AND MINING JOURNAL:

SIR: In reading the article of C. A. Stetefeldt in the JOURNAL of November 11th, 1882, I noticed in particular his remarks on increasing the capacity of a dry crushing battery. I have had long experience with stamp-mills, having begun milling in Colorado in 1861, and until this time did not believe that any machine made could take their place.

When the Bertrand mill was built, the managers concluded to try Krom's improved steel rolls. I was placed in charge of the mill at its starting up on June 20th, 1882, and felt great fear that we should not be able to crush the required amount of ore. I intrusted the entire management of the rolls to the machinist who set them up. He soon condemned them, and under his management, which continued until the first of September, they did not crush on an average more than thirty-five tons per day. At that time, I put a new machinist in charge of them, and from then until now we have averaged over fifty tons daily; and could we roast it, I am satisfied we could crush 75 tons daily.

We have crushed with two sets of Krom's rolls nearly 9000 tons of hard quartz ore, without any breakage, turning off, or repairs of any kind, and this with less than half the power that would have been required to drive a forty-stamp battery. For a long time, we crushed our ore to pass through a 30-mesh screen; but as we lixiviate, we have found it was better to leave it coarser. But we find very little difference in the capacity of the rolls then and now.

If I wished to prepare fine pulp for amalgamation, I should add the third set of rolls, set close and rigid without springs, and arrange to have all the nails, pieces of steel, etc., sifted out of the coarse pulp before it is fed to them. By this arrangement, I am quite sure that more ore could be pulped to any degree of fineness than could possibly be done with a forty-stamp battery. Any mill-man can readily see that the cost of shoes, dies, tappets, etc., to keep a stamp-mill in order to crush 9000 tons of ore would be as much as three sets of rolls would cost. I can now see

Digitized by Google

why so many have condemned their use and thrown them out. They require to be properly managed, and they will then do the work much cheaper than stamps. We certainly would not change now for the stamps, if they could be put in without cost.

We have demonstrated the following facts:

First. That we can pulp more ore with the rolls than can be done with a forty-stamp battery.

Second. That we have crushed 9000 tons of ore without a dollar's expense for repairs.

Third. That we have done it with less than one half the power that would have been required had we used stamps.

Fourth. That they make less dust, jar, and noise.

Respectfully yours, R. D. CLARK,
GEDDES, NEV., Jan. 22, 1883. Supt. Bertrand Mining Co.

THE PRODUCTION OF THE PRECIOUS METALS WEST OF THE MISSOURI RIVER.

Mr. J. J. Valentine, Vice-President and General Superintendent of Wells, Fargo & Co.'s Express Company, has just issued the following statement of precious metals produced in the States and territories west of the Missouri River, including British Columbia (and receipts in San Francisco by express from the west coast of Mexico), during 1882, which shows aggregate products as follows: Gold, $30,193,355; silver, $50,155,288; copper, $4,055,037; lead, $8,008,155. Total gross result, $92,411,835.

California shows a decrease in gold of $1,696,351. Nevada shows a total falling off of $1,484,188; the yield from the Comstock being $1,333,018, as against $1,726,162 in 1881—a decrease of $393,144. The product of Eureka District is $3,176,656. as against $4,127,265, in 1881—a decrease of $953,609. Utah, Colorado, New Mexico, and Arizona each show a notable increase on the products of last year.

The increase of transportation facilities for carrying bullion, pig-metal, ores, etc., has increased the difficulty of verifying the reports of products from several important localities; and the general tendency is to exaggeration when the actual values are not obtainable from authentic sources; but the aggregate result, as shown herein, we think may be relied on with reasonable confidence:

STATES AND TERRITORIES.	Gold-dust and bullion express.	Gold-dust and bullion other conveyances.	Silver bullion by express.	Ores and base bullion freight.	Total.
California	$14,733,643	$736,682	$509,342	$352,831	$16,332,498
Nevada	752,506	.....	6,588,023	3,022,847	10,363,376
Oregon	431,924	215,512	.....	.....	646,536
Washington	93,892	46,046	.....	.....	140,838
Alaska	.....	240,000	.....	.....	240,000
Idaho	1,091,208	191,568	882,890	1,160,072	3,325,738
Montana	2,150,000	215,000	4,065,000	1,574,000	8,004,000
Utah	76,954	6,201	3,139,020	4,921,000	8,143,175
Colorado	2,536,500	.....	4,803,925	18,592,840	25,933,265
New Mexico	43,728	21,864	919,047	2,682,493	3,667,132
Texas	.....	.....	257,597	.....	257,597
Arizona	386,517	100,000	5,631,083	3,180,667	9,298,267
Dakota	2,595,570	259,557	.....	.....	2,855,127
Mexico (West Coast)	510,192	.....	1,710,249	312,000	2,532,441
British Columbia	537,476	134,368	.....	.....	671,844
	$25,939,210	$2,167,694	$28,506,176	$35,798,750	$92,411,835

The gross yield for 1882, shown above, segregated, is approximately as follows:

Gold	32$\frac{97}{100}$ p. c	$30,193,355
Silver	54$\frac{77}{100}$ p. c	50,155,288
Copper	4$\frac{39}{100}$ p. c	4,055,037
Lead	8$\frac{67}{100}$ p. c	8,008,155
		$92,411,835

ANNUAL PRODUCT OF LEAD, COPPER, SILVER, AND GOLD IN THE STATES AND TERRITORIES WEST OF THE MISSOURI RIVER, 1870-1882.

YEAR.	Product as per W. F. & Co.'s statements, including amounts from British Columbia and W. Coast of Mexico.	Product after deducting amounts from British Columbia and W. Coast of Mexico.	The net product of the States and territories west of the Missouri River, exclusive of British Columbia and West Coast of Mexico, divided, is as follows:			
			Lead.	Copper.	Silver.	Gold.
1870	$54,000,000	$52,150,000	$1,080,000	.....	$17,320,000	$33,750,000
1871	58,284,000	55,784,000	2,100,000	.....	19,286,000	34,398,000
1872	62,236,959	60,351,824	2,250,000	.....	19,924,429	38,177,395

1875	80,889,057	76,703,433	5,100,000	.....	31,635,239	39,968,194
1876	90,875,173	87,219,850	5,040,000	.....	39,292,924	42,886,935
1877	93,421,754	93,811,582	5,085,250	.....	45,816,109	44,880,223
1878	81,154,632	78,276,167	3,452,000	.....	37,248,137	37,576,030
1879	75,349,501	72,685,888	4,185,769	.....	37,032,857	31,470,262
1880	80,167,936	77,232,512	5,742,380	$898,000	38,033,055	32,559,067
1881	84,504,417	81,198,474	6,361,902	1,195,000	42,937,613	30,653,959
1882	92,411,835	89,207,549	8,008,155	4,055,037	48,133,039	29,011,318

The exports of silver during the present year to Japan, China, India, the Straits, etc., have been as follows: From Southampton, $27,390,000. From Venice, $9,695,000. From Marseilles, $806,000. From San Francisco, $5,375,000. Total, $43,266,000, as against $27,000,000 from the same places in 1881.

HYDRAULICKING IN RAILROAD WORK.*

By J. T. Dodge.

In constructing the East Approach of Bozeman Tunnel, which is about 550 feet long from the mouth of the cut to the portal of the tunnel, an unusual amount of wet and sliding clay was encountered. The first 200 feet of the cut, being dry, was excavated without difficulty. In the next 200 feet, springs were encountered, and heavy slides occurred, amounting to three or four thousand yards. This material, tough and adhesive and saturated with water, was extremely difficult of removal. Shovels had to be dipped in water to make it slide off. Water had to be put on the cars to make it slide out; and when once started on a slide, it was not disposed to stop, but went from 50 to 100 feet beyond the limits of the embankment. The work was begun in February, 1882, and was prosecuted with as much diligence as the unfavorable season would allow By the 15th of July, the contractor and all immediately connected with the work had become very much discouraged. The division engineer was applied to for advice and direction. Timbers had been tried and swept away by the resistless "mud glacier." Driving piles was suggested as a means of holding back the mass. Tunneling through it was seriously considered. To go on with the work as it had been going on seemed hopeless.

"Sluicing" had been thought of when the work was first commenced; but there did not appear to be a sufficient supply of water within a reasonable distance. The placer mines of Helena being still in process of working, the writer availed himself of the opportunity of examining their methods of using water in the removal of earth. After doing so, and after having an interview with the principal owner, a gentleman of long experience in hydraulic mining, a survey was ordered, and it was ascertained that, by digging a ditch three miles long, we could reach a creek two miles west of the Summit, which gauged 250 miners' inches, and which would probably supply water enough to remove 500 yards of earth per day. It was then decided that, if the contractor would surrender that part of the work, the railroad company would try the experiment of sluicing. Accordingly, the ditch was commenced on the 20th of July, and completed on the 9th of August, so that water began running through the cut on the latter date. The grade of the ditch was assumed at 13·2 feet per mile, and its area at about 4 feet. Several flumes had to be constructed across narrow ravines, and some rock-cutting was encountered. A ground sluice 2 feet wide by 11 inches deep was placed in one side of the cut on a grade 2·2 feet per 100, parallel to the grade of the railroad. Water for the jet was taken from the main ditch in a flume 11 by 12 inches, and conveyed by about 300 feet of six-inch galvanized-iron pipe and 112 feet of cotton hose, down into the cut where it could be operated under a head of 60 feet. The nozzle was provided with one two-inch ring and one 1¼-inch ring, to be used as circumstances might require. To supply this nozzle probably required about 40 inches of water when under 60 feet head. The 1¼ jet was more compact and effective in cutting down tough and hard banks than a 2-inch jet. The whole amount of water reaching the work during the first few days of our operations probably varied from 120 to 150 inches. The weather being dry and hot, it began to diminish soon after, and fell as low as 72 inches about the 10th of September. The weather then turned cooler, it increased again to a moderate extent, and then remained about the same until work was completed on the 24th of September.

By a careful estimate of the work done in the first twelve days, it appears that the amount of earth moved was 727 yards per day. The amount done between the 10th of August and 24th of September was 17,060 cubic yards. The cost of moving the same, including digging the ditch, buying pipe and hose, and all other expenses, was less than 30 cents per yard, which was far below what it would have cost by shoveling. The work was prosecuted night and day by three shifts of two men each. Near the close of the work, a few men were employed in daytime in sloping, and some labor was used in making a dam to save part of the material in embankment. The delay of the work during the time the ditch was digging was probably a benefit, by giving the ground time to dry and drain out, so that no large slide occurred after sluicing was commenced. The amount of earth moved between the 1st of February and the 20th of July by shoveling at the bottom and scraping from the top was 19,730 cubic yards, an amount which could have been removed in twenty-seven days by sluicing with the volume of water used during the first twelve days.

MECHANICAL ORE CONCENTRATION, PNEUMATIC OR HYDRAULIC.

Written for the Engineering and Mining Journal by S. R. Krom, New York.

To the several criticisms which have appeared in the last few years, in technical journals, on the pneumatic system of concentration, it has been my intention, at a convenient time, to reply in such a complete way as to convince these critics that they are entirely wrong in their theories and conclusions. The recent articles of Mr. F. M. F. Cazin, on the subject of ore concentration, and his criticisms on the pneumatic system and every one who has indorsed it, and his personal attack on the author of the system, published in the *Mining Record*, New York, have suggested that the present is a proper time for me to make my reply.

To aid to a clear understanding of the position and arguments of the supporters of the theory that water is the best medium, I shall be obliged to quote more at length than I desire from my opponents, who have written on this subject with the sole purpose of showing the superiority of hydraulic to pneumatic concentration.

Mr. Cazin says: "The promoters of the pneumatic system have resorted to deceptive experiments, deductions, and statements in favor of their system, all of which scurrilous practices should be frowned down by scientific discussions.

"The promoters of the pneumatic system of ore concentration have pretended that, of the two mediums, water and air, water be not the better one, either theoretically or practically, and that they can show the claim in favor of water to be a fallacy; while they not only have not been able to make good their pretensions, and while theory as well as

* Read before the Western Society of Engineers.

Digitized by Google

practice have both passed to the order of the day over these pretensions."

I will first devote myself to the theoretical and then to the practical part of my subject. Among those who have in times past entered into the theoretical discussions to prove water the best medium for concentrating ores, I may mention the names of W. P. Ward, M.E., J. A. Church, M.E., Henry Englemann, M.E., J. C. Bartlett, A.M., and Mr. Cazin. All of these gentlemen have relied on the correctness of the theories laid down by Rittinger and Pernolet, to sustain their theoretical discussions.

Mr. Cazin admits that motion can be substituted for lack of density, saying, "that one can be a possible substitute for the other," but contradicts himself afterward in declaring it unnecessary to search for a common medium "for the separation of solids by their specific gravity inasmuch as the best one in one case may be the worst in another." (Why not, then, substitute motion for density, as one can be the possible equivalent of the other?)

Mr. Cazin names water and air as the only mediums practically used; but enumerates the following substances, sodium amalgam, molten lead, molten combination of lead and sodium, solutions of salts, and finally compressed air, as mediums applicable for ore separation, and he names the latter, as he says, to prevent its use being impeded in future by somebody taking out a patent on its use.

It so happens that compressed air has been used whenever air was used at all for ore concentration, whether that compression was more or less; and Mr. Cazin is a little late in naming compressed air as something new, and promising it as a gift to the public.

Mr. Cazin also holds to the great superiority of a medium of intermediate density, and gives the following ingenious proof: "That a boulder of quartz, specific gravity 2·5, and a piece of wood, density 0·7, are carried off by a creek flooding its banks; and that the wood will float, while the rock will sink, so that a local separation is effected at once, whatever the difference in volume of quartz or wood may be."

Precisely what Mr. Cazin intends to prove by this illustration I am unable to see.

Mr. Cazin in his arguments further affirms the views of his friend Bartlett: "That of two fluids, both lighter than the ore, the one is preferable which is heavier of the two." And why? "Because," he says, "it then requires less ascending velocity (motion) than the other, in order to lift the lighter above the heavier material."

The advocates of the wet system of ore-dressing hold that the so-called ideal medium is one whose density is intermediate between the minerals to be separated, and that if we possessed such a medium, "no machinery would be necessary;" and that as we can not obtain the ideal medium of the required varying densities, the one nearest to the intermediate is theoretically and practically the best. It is interesting to note also that they admit the possibility of substituting motion for density; and as the pneumatic system is based on that very axiom, their complete inconsistency in opposing that system is clearly exposed.

According to the present developments of the art of ore-dressing, it is admitted by all, and we shall take it for granted, that some fluid is necessary to effect separation, except with some magnetic ores; and although Mr. Cazin does not fully admit that air and water are the only two practical mediums, yet he allowed the question to be narrowed to air or water. We shall now first consider and analyze the question whether a medium of intermediate density (without motion) is the ideal or perfect one. Experience has sufficiently shown that no medium at rest is practicable for ore-dressing. An exact ideal medium of intermediate density without motion, or the necessary resistance obtained by giving the medium a continuous uniform motion, has been the dream of many experimenters, and that it would be perfection in ore-dressing is not an unreasonable supposition. We can imagine such a closely-regulated current, representing exact intermediate density; but while so beautiful in theory, it will not work in practice, and we do not find all the heavy mineral sinking and the light all floating upward and off, like Mr. Cazin's pine board in the flood. Mr. Cazin has failed to give us an example of any successful, practical application for ore-dressing of his principle of intermediate density. What plan he had in his mind when he made his famous offer to the skeptical Ducktown manager, does not appear in his article. For the separation of certain substances, the theory does prove effective; but for the general application of ore-dressing, the theory is fallacious. Mr. Cazin, following Professor Bartlett, says that "the difference between diameters of spheres being equal falling in air, is less than between diameters of spheres being equal falling in water."

This statement has no application to the subject, because it has reference to the spheres falling in air without motion. By giving motion to the air to make its resistance equal to water, the behavior of the spheres in falling must be theoretically exactly the same in both mediums, and such a statement as just quoted is calculated to mislead, and is therefore deceptive. The formula should read as follows: Equal falling spheres in liquids of different densities will be also equal falling in a current of air, regulated by compression, to give the equivalent resistance offered by the liquid. To illustrate the above formula, I instituted an experiment to demonstrate the incorrectness of previous formulæ on the subject of the free fall of mineral grains in air and water. I erected two glass tubes, each 2 inches in diameter and 8 feet long. One of these tubes I filled with water; through the other I forced a current of air. I found that practically, as stated, ½-inch globule of galena and ¼-inch globule of quartz fall in equal time in a column of water; but when the current of air was adjusted to retard the galena in falling to the same extent as water, then the ¼-inch globule of quartz was sustained by the current of air, and did not fall, but oscillated up and down in the open end of the tube, while the galena ball fell as rapidly as in the tube of water. I also employed bodies of other forms with conical-shaped heads (which has been illustrated in previous publications). In experimenting with these, I regulated the current of air in the air-tube, to give exactly the same resistance as water would to the falling bodies of equal weight and size, one in the water, the other in the current of air: both reached the bottom in equal time. I then let fall Nos. 1 and 3 in water; and when No. 1 reached the bottom, No. 3 was about 10 inches behind. Next I let fall the same Nos. 1 and 3 in air, and No. 1 fell in the same time in air as it did in water; but No. 3 did not fall, but, like the quartz ball, oscillated in the open end of the tube.

Ordinary philosophical reasoning could lead to no other conclusion than that which the above experiment demonstrated, namely, that the galena and quartz would be equal falling in the air-current under the conditions here described. But the experiment demonstrated that air would give some superior results as the concentrating medium beyond what I had expected.

Professor Bartlett, in his criticisms of this experiment, makes use of Rittinger's treatise to prove that the experiment was not tried under proper conditions. He says: "The quartz ball did not fall in the experiment as performed, because the condition under which the experiment was tacitly supposed to have been performed, the condition upon which every discussion on the laws of bodies falling in liquids" (Mr. Bartlett says), "was violated." "This condition was, that the air should be perfectly free to move, that the tension of the air below the ball should be the same as above it. In the case of the galena ball, this was practically complied with." In other words, Mr. Bartlett asserts that the more favorable effect was due to the narrow cross-section of the glass tube.

To avoid this sort of criticism, which was in no sense a just one, because the condition of the water-tubes was exactly equal to the condition of the air-tubes, I performed the second part of the experiment with steel wire tacks of uniform diameters, but different lengths and with uniform diameters of heads, so that each presented the same surface to both the air and water alike, and their form caused them to keep in a perpendicular position. In this experiment, the proper conditions as required by Mr. Bartlett were perfectly complied with; but he overlooked this part of the experiment, for the reason, I suppose, that it would interfere with the conclusions he wished to arrive at, and nullify his statements, as it does most completely. The experiments with the galena and quartz ball were, however, properly performed, and even smaller tubes would have been proper.

The tubes with the water proved large enough to allow the galena and quartz ball to fall in equal time, and of course the air-tube should not, for this experiment, have been any larger than its companion.

The distinguished Councilor Althans answered fully Mr. Bartlett's criticisms in the following words: "It must not be overlooked that in pneumatic jigging the equal falling grains suspended in the stream of air are always in narrow air-spaces, and that in this case the large grains, in comparison with the adjacent smaller but specifically heavier grains, are similarly situated to those in Krom's experiments in narrow glass tubes. In the opinion of the author, therefore, practical experience alone can decide which process, the hydraulic or the pneumatic, can effect the closer separation according to specific gravity and size of grain."

The remark of Councilor Althans is a sensible and correct observation, and illustrates the difference between unbiased and intelligent reasoning, and the blind following of theories which have never been realized in practice. Mr. Cazin criticises some experiments by remarking, "Krom's experiment with glass tubes gives results absolutely contrary to real facts."

The exact meaning of Mr. Cazin's remark is not clear. We generally suppose that the results are the facts themselves. In another place, he mentions compressed air as a substitute for a medium of an intermediate specific gravity, and he also says, "Compressed air would be more successful" for concentrating ores.

If we now sum up the conclusions, as far as we have gone, we find that the theory of a so-called ideal medium of intermediate density without motion is a fallacy, as it will not work in practice. We further find that motion given to water or air is an exact equivalent for density, and serves all the purposes of a medium of intermediate specific gravity. We find that the formulæ in relation to the free fall of spheres in water and air are not correctly stated; and that, contrary to the impressions intended to be given by such theoretical writers as Professor Bartlett and Mr. Cazin, spheres which are equal falling in water are also equal falling in air when raised to the same resistance by motion.

By simple reference to facts, we learn that a medium dense enough to support the lighter in specific gravity without motion or whether the exact equivalent in density is obtained by giving continuous uniform motion to the fluid, has not proved a successful means to effect the separation of ores, and that all the theoretical discussions to prove water the best medium have been founded on an erroneous basis.

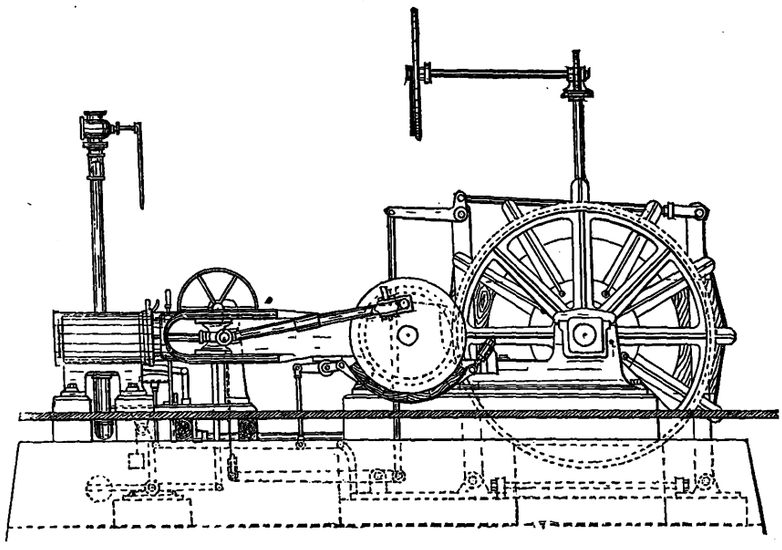
(TO BE CONTINUED.)

OUR PRODUCTION OF BESSEMER STEEL IN 1882.

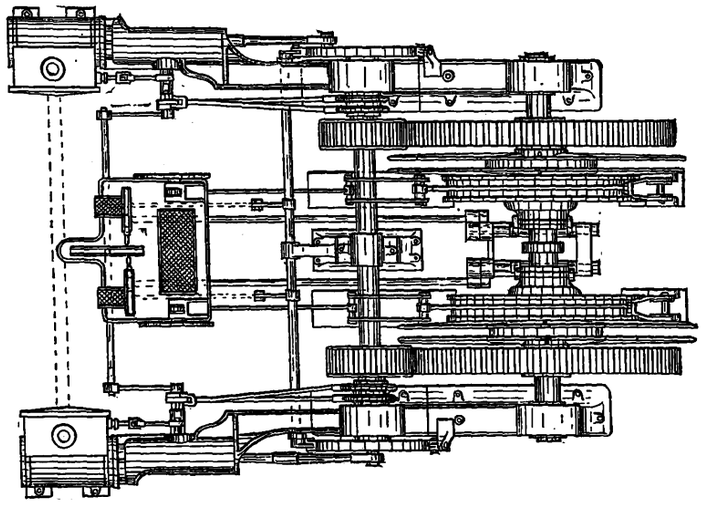
Mr. James M. Swank, Secretary of the Iron and Steel Association, has received complete statistical reports from the companies owning the fourteen completed Bessemer steel-works which were in operation in the United States in 1882. From these reports, he announces in the *Bulletin* that the quantity of Bessemer steel ingots produced in the United States last year was 1,696,450 net tons, or 1,514,687 gross tons. The increase over the production of 1881 was 10 per cent. This is a much smaller annual rate of increase than has been made for several years. The increase in the production of 1881 over that of 1880 was 28 per cent, while 1880 increased 30 per cent over 1879. The production of Bessemer steel ingots in the last six years has been as follows, in net tons:

1877	560,587	1880	1,203,173
1878	732,226	1881	1,539,157
1879	928,972	1882	1,696,450

The quantity of Bessemer steel rails produced in 1882 by the fourteen works above referred to was 1,334,349 net tons, or 1,191,383 gross tons. This was an increase of six per cent on the production of the same works in 1881, which amounted to 1,253,129 net tons, or 1,118,865 gross tons.



These figure do not cover the total production of steel rails in the United States, as there were some rails rolled in 1882 from imported steel blooms, and there were also some open-hearth steel rails rolled. Complete statistics of the production of these kinds of rails, however, have not yet been received; they will probably not quite reach 100,000 gross tons, making our total steel-rail production in 1882 approximate 1,300,000 gross tons, against a total in 1881 of 1,210,285 gross tons.



The fourteen Bessemer steel-works referred to above contain 35 converters. The Scranton Steel Company is building a two-converter plant at Scranton, Pennsylvania, which it is expected will be completed and will be put in operation in the spring.

DOUBLE REEL GEARED HOIST FOR FLAT ROPE.

In the accompanying engraving, we illustrate a hoisting-engine, built by Messrs. Fraser & Chalmers, of Chicago, which is being widely introduced in Western mines for great depths. Two sizes have been recently built, the one with 10 by 16-inch cylinders, for the Parrott Silver Copper Company, at Butte City, Montana, and the Monarch mine, of the Atlanta Mining Company, Rocky Bar, Idaho; and the other, with 12 by 16-inch cylinders, for the Lexington mine, Butte City, and the Champion mine, Central City, Colorado. We give below the specifications of the former size, adding the corresponding figures for the latter in parentheses. The 10 by 16 inch (12 by 16) engines are designed for hoisting from a depth of 1000 (1200) feet, the reels winding 1000 (1200) feet of 2¼ by ⅝ inch (3 by ⅝) flat wire rope. Starting with a speed of 170 (200) feet, it is increased to 460 (500) feet at the mouth of the shaft, the reel becoming larger by the winding of the rope on it. When the cages are balanced, the engine will hoist 5500 (7000) pounds. The weight of the engines proper, exclusive of boilers, etc., is 38,000 (58,000) pounds.

The engines are double reversible, the cylinders being dry-sand castings with double slide-valve and short steam-ports. The frames are of improved pattern, with circular guides bored true in line, the bases planed on the same plane with the cylinder feet. The composition-metal crank-box is adjustable, and is provided with oil-grooves. The crank-shaft is made of hammered iron 5 (8¼) inches in diameter with 6-inch bearings and two heavy disk-turned and polished cranks of large diameter to act as fly-wheels. The main driving-pinion is fitted and keyed to the center of the shaft, and bearings are provided on both sides near the pinion, to avoid vibration. The pinion is 16 (19) inches in diameter, with a 10 (10½) inch face and 3 (3½) inch pitch. The spur-wheel is 7 (8) feet in diameter, with 10-inch face and 3 (3½) inch pitch. The four eccentrics are fitted to the shaft. The piston is of the double-ring pattern, the piston-rod being made of steel. The cross-head is cast-steel, with adjustable slide-plates of bronze and steel wrist-pin, the connecting-rod being made of forged iron and provided with bronze boxes. The links of the revolving gear are cast-steel. There is a crank-brake for each crank, lined with wood blocks, both being connected with one shaft, to be worked by foot-levers on both sides of the reversing-lever.

The two reels have 30 (42) inch centers, and are large enough to take up 1000 (1500) feet of 2¼ by ⅝ (3 by ⅝) inch flat rope. They are provided with sleeves lined with composition metal, so arranged that they can be taken out easily and be re-babbitted when worn out. The brake-wheels are cast in one piece with the centers, and are turned true on the rim. The reel-shaft is hammered iron, 8 (10) inches in diameter in the center, tapering down to 6 (7½) inch bearings. It is turned and provided with deep key-seats for gear and clutches.

The post brakes are all of wrought-iron, with brake-blocks of wood, mounted in heavy cast-iron shoes, to be bolted to the foundation. The brakes are adjustable on the top and bottom, and are worked by strong wrought-iron levers, racks, pinions, and hand-wheels. The latter are mounted on well-designed cast-iron stands near the reversing-levers. It will be noted that Messrs. Fraser & Chalmers have throughout studied the details carefully, and have made good arrangements for easily erecting the machinery, for convenient handling, and for avoiding repairs which so much hamper mining operations, particularly in inaccessible regions.

The forge department of the Elba Bolt and Iron Company, Limited, Pittsburg, was destroyed by fire recently. In the packing-room, 1100 kegs of nuts, bolts and washers were stored, which were badly injured. In the forge department proper, were twenty-four puddling-furnaces, one train of muck rolls, an the main engine of the mill, all of which are probably either ruined or badly damaged. The destroyed portion of the works will be rebuilt at once.

THE EFFICIENCY OF MODERN TURBINES.*

By Robert H. Thurston.

The mechanical engineer has open to him as his exclusive province one department which is as yet only partially developed in practice, although well advanced in theory. I refer to that of hydro-mechanics, and especially the utilization of water power. Although one of the earliest opened by the old Greek engineers, it has been one of the latest developed. Archimedes, Ctesibus, and Hero were familiar with the principles of fluid pressure; Torricelli, Pascal, Newton, and Bernouilli developed the fundamental principles of hydro-dynamics; Du Buat, D'Aubuisson, Prony, Eytelwin, and, above all others, Darcy, supplied experimental data; but it has been reserved for our own generation to apply the knowledge so early acquired to the production of efficient hydraulic engines. But a few years ago, the vertical water-wheel, as constructed by Fairbairn for moderate and for high falls, and the undershot wheel of Poncelet, were the standard wheels in all countries, notwithstanding their cumbrous size, their slow movement, and the great cost involved both in their own construction and in that of their machinery of transmission. Their efficiency was thought high, although rarely exceeding 75 per cent. These wheels have had their day, and nothing is likely to occur to save the whole class from ultimate disuse. The turbine—introduced in an effective form by Fourney-on a half-century ago, and especially in the late forms of Fontaine, Henschel, Jonval, Schiele, and others abroad, and by Boyden and his successors in the United States—has become the only water-motor in general use. This small, cheap, quick-running wheel has completely displaced all the older forms, whether overshot, undershot, or breast wheels. The three principal types—parallel, inward flow, and outward flow—are all in use and doing good work. In Europe, they are all made by good builders, as here; but the tendency seems to be, in the United States at least, to introduce most generally another and peculiarly American type—the inward and downward flow wheel—as illustrated in the wheel built by Risdon. In efficiency, notwithstanding the comparative neglect of these motors by scientific investigators, there has been a steady and important gain during late years. The improvements which have been *felt out* by makers, working often in the dark—for few builders claim to understand the principles of their art, and no two even ever agree in their statements of the principles underlying their practice—have resulted in a gradual elevation of standard, until, to-day, a wheel which, under favorable circumstances, can not exhibit an efficiency of 80 per cent, must drop into the background. I have been asked to certify a trial giving, as claimed, 95 per cent; but that figure could, I am sure, only be attained by chance, if at all, when all conditions conspired in its favor. But wheels are, I have no doubt, doing work by the day and by the week at 80 per cent. It may be said tha Boyden did as well a generation ago. True, but only with large wheels, built as carefully as the chronometer is made, and fitted with polished buckets and diffusers, and tested under conditions purposely made the best possible. To-day, our builders of turbines give their wheels such exact proportions, and take such care in the ordinary work of the foundry, that they obtain these high figures from wheels almost directly from the sand. So far has this change gone, that our theory of the turbine, as modified by friction, requires careful revision. Accepting the older coefficients for friction and losses of energy, it will probably sometimes be made to appear from experimental trials that the wheels of our best makers are a trifle better than perfect. It would seem from figures sent me that friction in a well-formed wheel becomes partly a means of transfer of energy from water to wheel, and that the loss of

* From the President's Annual Address before the American Society of Mechanical Engineers.

Digitized by Google

efficiency due to that element is much less than has been supposed. In some of the later wheels, losses of energy due to eddies occurring within the flowing mass have been reduced to such an extent as to considerably improve their performance. In the regulation of the turbine, an excellence has been attained that is thoroughly satisfactory in some cases, and the best wheels have been found to give an efficiency at half and at three quarters gate nearly equal to the best at full gate. As the efficiency at part gate is often more important than at full gate, it is easily seen that this means a vitally important gain.

THE PRODUCTION OF THE MINES AND SMELTING-WORKS OF THE GERMAN EMPIRE IN 1881.

The mineral statistics of Prussia are promptly published; but they do not in many points represent the total production of the German empire, many of the smaller States not being readily accessible. The following figures, given in metric tons, at 1000 kilograms or 2205 pounds, show the entire output of the empire for 1881:

	Tons.
Coal	48,688,161
Lignite	12,852,324
Asphaltum	42,330
Petroleum	4,108
Graphite	1,510
Rock-salt	311,907
Salt from salt-works	456,958
Kainite	160,538
Other potash salts	745,353
Chloride of potassium, from solutions	113,168
Chloride of magnesium, "	11,070
Glauber salt, "	49,062
Sulphate of potassa, "	13,280
Sulphate of potassa and magnesia, from solutions	5,620
Sulphate of magnesia "	25,908
Sulphate of alumina, "	12,837
Alum, "	5,068
Iron ore (German empire)	5,411,890
" (Luxemburg)	2,161 882
Manganese ore	13,642
Iron pyrites	125,057
Pig-iron (charcoal) 44,564	
" (coal or coke) German empire 2,567,550	
" " " Luxemburg 293,615	
" (mixed fuel) 8,280	
Total, pig-iron	2,914,009
Spelter	105.477
Lead	86.729
Litharge	4,514
Copper	14,803
Silver (kilograms)	186,990
Gold "	381
Cadmium "	3,367
Nickel	135
Tin	102
Bismuth	56
Sulphur	2,994
Sulphuric acid	257,112
Fuming acid	1,514
Green vitriol	7,414
Blue vitriol	4,804
Zinc vitriol	616

QUICKSILVER STATISTICS FOR 1882.

The San Francisco *Commercial Herald* prints the following figures for the exports of quicksilver:

EXPORTS OF QUICKSILVER.

	1881.		1882.	
To.	Flasks.	Value.	Flasks.	Value.
Mexico	15,141	$447,573	9,741	$288,546
New Zealand	139	4,099	105	3,000
China	17,006	487,495	19,451	560,353
Japan	315	9,504	620	17,601
Central America	38	1,088	55	1,494
Australia	1,220	35,910	1,960	50,280
British Columbia	14	395	21	616
South America	816	23,889	1,986	59,621
Bombay	10	287	.....	.....

In 1866	30,287	In 1882	34,770
In 1867	28,853		

In speaking of the tariff on quicksilver, the *Commercial Herald* has the following interesting summary of the relative position of the industry in this country and in Spain:

The Almaden mine, in Spain, owned and worked by the government of that country by peons or laborers, at a tithe of the prices paid here, dates back in its history thousands of years, is of surpassing richness and extent, exceeding in value all known mines of this character in the world, is furnishing 50,000 flasks yearly, with a capacity of sufficient mercury for the whole world's needs for ages to come, and at a price profitable to that government that would close up every mine in this State, bankrupt the thirty to fifty millions of dollars invested in them, and turn out of employment more than two thousand persons engaged in working them. That this can be done, and is even contemplated, we shall attempt to show. A party holding semi-official relations with the Spanish government stated, some months since, that the "mine with its new furnaces is in a position to utterly swamp the market, so as to make every competition impossible and utterly unprofitable." An exhaustive report on the "mines and works of Almaden," made by M. H. Kuss, M.E., brought down to the year 1875, shows that the cost there per flask, including "personal expense of office, exploiting (which covers stoping, timbering, and masonry, drainage, ventilation, extraction, and transportation), distillation and bottling, shops, hospital and chapel, domain of Castilseras, extra expenses and sundries," in fact, any and every expense connected in the remotest manner with the production and placing on the market, averaged for the five years ended 1875 46¼ francs per flask, and for the year 1875, 45·67 francs, equal to $8.50 per flask, or 11·11 cents per pound, less than one third the ruinously low prices the article is selling at to-day. An extended and careful inquiry made here, covering over five sixths of the production of 1881, showed that the labor required to produce a flask of quicksilver was eight days, say for 60,000 flasks produced that year, 480,000 days' labor, and at the moderate figure of $2 per day, equal to $960,000, or $16 per flask, and this for labor alone, to which, if we add the cost of the flask or package, fully $1 each, including a duty of 35 per cent exacted by the government, we have a cost for labor and the package $17 per flask, just double the expense of that from the Spanish mine when laid down in the London market. We have been considering the cost of producing at the Spanish mine in 1875, since which time it is understood that there have been important improvements made there, especially in the treatment of its ores, reducing the expenses very largely, and proportionately the cost of the article, to what extent we are not advised, but if, in the reduction of ore, the same as here during the past ten years, probably fully 25 per cent. Referring again to Professor Kuss's report, we find that the "Spanish mine produced from 1564 to 1700, 17,863,720 tons; from 1700 to 1800, 42,149,501 tons; from 1800 to 1875, 60,166,379 tons; in all, 120,179,600 tons mercury (equal to 3,518,984,866 flasks of 76½ pounds each). When we attempt to determine the value of this enormous quantity of mercury, we find it rather difficult to estimate. The price of mercury reached 12 to 15 francs per kilogram before the discovery of the mines of California—New Almaden and others." Estimating a kilogram at 2·2 pounds 15 francs, the price obtained before the discovery of quicksilver in California is the equivalent of about $1.20 per pound. In the year 1850, when we had barely commenced producing here say 7700 flasks, the London price was £15 per flask—about 95 cents per pound. In 1861 and 1862, when our product reached from 35,000 to 42,000 flasks a year, the price here fell as low as 45 cents per pound, and at London to £7 per flask, with a production of about 25,000 yearly at the Spanish mine. This condition of prices remained without material change until 1870, when our mines were straitened in their bodies of ore, particularly the New Almaden, and our total production of 53,000 flasks in 1865 fell to less than 30,000 yearly, on an average for five years, say 1870–74 inclusive, and the price, owing to the small supply, was advanced in London to £26 per flask, and here to $1.55 per pound. It could not have been that the Spanish mine was short of ore at that time; for its reserves are always years ahead of its out-turn; but rather, that the management chose to take advantage of our misfortunes by withholding its product, and so forcing prices to an extravagant figure, which would doubtless be done again as soon as a few more of our mines could be seriously crippled and compelled to shut down, by the increased production of that mine thrown upon the market at about 30 cents per pound, which would still leave the Spanish government a profit of about 200 per cent upon the cost of producing and putting its quicksilver upon the market. For some time past, the Rothschilds have had the handling of the product of the Spanish mine, to protect them for a loan made to the government. It has been authoritatively stated that they were required by the terms made for selling the quicksilver to return not less than £6 per flask to the government, and this is so stated in Professor Kuss's report, to wit: "If the price of the metal should descend below this figure (£6), the government would not receive less than £6 sterling per flask." Evidently there has either been a change in the terms of agreement, or the Rothschilds have a secret understanding with the government; for during the past year, Rothschilds' price has ranged, for the most part, below £6, say £5 15s., and since the beginning of the year as low as £5 10s., as we have already stated, and these gentlemen are not likely to make a present to the Spanish government of 5@10s. a flask on 50,000 flasks and upward yearly. It is not easy to divine what can be the motives of the Rothschilds in pressing the price down so low, unless it be their object to force our mines to close up, and so give them the monopoly of the market for this article. A further decline of 10s. per flask in London, say £5, would be the equivalent of about 30 cents per pound, at which figure it is doubtful if more than two mines in this State could be operated without loss. Some time since, an attempt was made between the Rothschilds and parties here in interest to restrict the production with a view of bringing about better prices. The Rothschilds demanded, as a *sine qua non*, that the reduction should come wholly from this State, while the Spanish mine should be allowed to retain its full former quota, and even increase it. The proposed arrangement fell through, as there was known to be a large stock in London, and our producers were not disposed, after selling their own production at moderate figures, to stand aside and see the heavy stock in London worked off at advanced figures. It was about this time that we were given to understand that the Spanish mine was in a "position to utterly swamp the market, so as to make every competition impossible and entirely unprofitable." The duty proposed by the Tariff Commission, 10 per cent, and the equivalent of less than 3½ cents per pound on the present London price, would give our government a mere bagatelle, $25,000 to $30,000 a year, upon imports as large as those of last year, and *they* were without precedent in our history. With a specific duty of 10 cents per pound aiding the producer when the article is low, and enabling him to sell at from 40 to 50 cents per pound, a fair price for the consumer, indeed for both parties, we might hope for marked improvement in this important industry. There need be no apprehension in such a case of high figures, as Rothschild and others holding heavy stocks in London would stand ready to give us quicksilver, say 30@34c. in London, which, with a duty of 10 cents per pound, would prevent the local price going above 45@50c. There is no argument that can be made in favor of protecting other metals and industries that does not apply with equal force to this, and now that we are confronted with both the threat of being crushed out by a foreign government and with an accumulated stock of 100,000 flasks liable to be thrown upon our markets at any moment, it would seem that Congress could not do less, under a proper representation of facts, than to give us a duty of 10 cents per pound. When prices were high in 1874 and 1875, active prospecting

followed in this State, and some good developments resulted, notably the Sulphur Bank, Guadalupe, Napa Consolidated, and others. But they are not able to compete with the Spanish mine in richness and cheapness of labor, and we venture to say that, unless Congress does extend aid in the shape of a reasonable duty, we shall find ourselves, sooner or later, dependent upon the foreign article, and at such prices as the owners choose to fix for us. Whether, when all our mines are closed down for the want of a judicious duty, that figure will be anywhere near as favorable for the consumer as the present one, may well be questioned.

Mr. J. B. Randol, manager of the New Almaden mine, has published his usual valuable report on the production and price of quicksilver, from which we extract the following figures:

PRODUCTION OF QUICKSILVER, FLASKS.

Mines:	1880.	1881.	1882.
New Almaden	23,465	26,0.6	25,867
New Idria	3.209	2,775	1,954
Redington	2,139	2,194	2,228
Sulphur Bank	10,706	11,152	5,133
Guadalupe	6,670	5,228	1,138
Great Western	6,442	6,241	5,279
Pope Valley	275	.....	.....
Napa Consolidated	4.416	5,552	6,838
St. John	492	.....	.....
Altoona	245	.....	.....
Oakland	166	.....	.....
California	422	.....	.....
Great Eastern	1,279	1.065	2,127
Loverdale	.....	207	.....
Various mines	.....	376	256
Total	59,926	60,851	50,820

The following table shows the production of the mines of California, Austria, and Spain, and the variations in the price of the metal in San Francisco and in London, from 1850 to 1882, both inclusive:

YEAR.	Total yearly production of California mines.	Exports from San Francisco by sea and rail.	Price in San Francisco per pound.		Production of the Idria mine of Austria.	Production of the mine of Almaden Spain in periods of five years.	Price in London per flask.	
	Flasks.	Flasks.	Highest.	Lowest.	Flasks.	Flasks.	Highest.	Lowest.
1850	7,723	6,497	$1.50	$1.10	4,100		£ s. d.	£ s. d.
1851	27,779	10,791	1.00	.75	4,092		13 15 ..	12 5 ..
1852	20,000	21,458	.80	.72½	4,085	101,517	11 10 ..	9 7 6
1853	22,284	18,800	.72½	.72½	4,409		8 15 ..	8 2 6
1854	30,004	20,963	.72½	.72½	4,060		7 15 ..	7 5 ..
1855	33,000	27,165	.72½	.67½	4,446		6 17 6	6 10 ..
1856	30,000	23,740	.67½	.67½	5,935		6 10 ..	6 10 5
1857	28,204	27,262	.70	.60	9,189	110,058	6 10 ..	6 10 ..
1858	33,000	24,412	.65	.60	4,977		7 10 ..	7 .. ..
1859	13,000	3,399	1.00	.65	8,239		7 5 ..	7 .. ..
1860	10,000	9,488	.75	.65	4,821		7	7 .. ..
1861	35,000	35,095	.65	.45	8,493		7	7 .. ..
1862	42.000	23,747	.50	.45	4,712	122,117	7	7 .. ..

A MAMMOTH coke-car, built for the Powelton furnace at Saxton, has just been turned out of the Harrisburg Car Manufacturing Company's shops. It is not only remarkable on account of its size, but its novel construction attracts a great deal of attention. It is thirty-five feet in length, eleven feet four inches in hight, and has a capacity of twenty-four tons. There are three gates on each side that are raised and lowered by means of pulleys and are designed for convenience in loading. Six trap-doors in the bottom of the car can be let down instantly, when the load will discharge itself without further assistance. The car is to be used for conveying coke from the ovens to the furnace.

THE EFFECT OF WORK UPON THE QUALITY OF IRON AND STEEL.

Since the middle of 1879, the Association of German Railroads and the Association of German Iron and Steel Makers, have been quarreling about the specifications on the delivery of iron and steel for railroad purposes, the former carrying the requirements, determined by mechanical tests, very high, against which the latter have vigorously protested. Both parties have attempted to fortify their position, not alone by elaborate reasoning, but also by carefully conducted experiments. The facts which have been accumulated during the test are very valuable, and have thrown much light upon the relation between the actual duty in service and the quality as revealed by mechanical tests. The railroads insist that great tensile strength is a proof of good quality, and they have attempted to gather facts to show that there exists a relation between the figures obtained by test and the record of the material in service. Herr H. Brauns, of Dortmund, stated, at a recent meeting of the German Association of Iron and Steel Makers, that a careful examination of all the facts gathered by him bearing on this question has failed to bring out any such relation. He concedes that, for resistance against dead weight, against steady stress, the tensile strength of iron and steel furnishes a good guide for estimating quality. But the duty which rails, tires, and axles are called upon to meet in actual service is different in character. The German railroads demand high tensile strength and great durability, judging the latter from the contraction of area.

In order to show that their position is at least open to serious doubt, Herr Brauns has made a very interesting series of tests. It is generally acknowledged by consumers that the quality of iron and steel is improved by "putting work into it," that is, by reducing the section by hammering or rolling when hot. Now, if the ground taken by the railroads were correct, both tensile strength and ductility should be increased by work. Herr Brauns therefore prepared a series of samples, taking one half of a piece of metal and forging it down by 65 per cent of its original area, and then working down the other half by 85, 90, and 95 per cent of its original area and cutting out test pieces of equal size cold. The following were the results obtained. We have not converted the figures to our units, because the relation is plainly shown:

Worked down by. Per cent.	Tensile strength. Kilos. p. sq. mil.	Elongation. Per cent.	Contraction.
	First Group.		
65	47·7	25·00	54·2
85	52·6	18·70	41·8
65	49·0	24·00	47·2
90	50·3	23·50	46·6
65	48·9	23·00	27·1
95	51·0	21·25	47·3
	Second Group.		
65	63·9	14·50	30·1
85	64·1	14·50	25·9
65	60·3	15·00	35·0
90	63·8	15·00	37·0
65	61·7	17·00	32·9
95	65·3	13·50	32·8
	Third Group		
65	48·6	21·75	42·5
85	51·0	20·75	44·1
65	48·6	21·00	42·7
90	52 0	19·50	42·0
65	47·7	22·50	41·2
95	55·6	18·00	40·8
	Fourth Group		
65	45·9	20·50	46·0
85	48·6	17·00	49·0
65	47·0	23·50	48·4
90	51·0	20·00	40·6
65	48·3	23·00	46·7
95	51·3	22·00	48·1

A second series of tests was made by working them to 60 per cent of original area, and working two other samples out from the same piece down to 80 and 90 per cent of original area, with the following results:

Worked down by. Per cent.	Tensile strength. Kilos. per square mil.	Elongation. Per cent.	Contraction of area. Per cent.
	First Group.		
60	50·6	22·70	42 7
80	54·4	19·25	43 0
90	56·6	16·00	42·0
	Second Group.		
60	50·3	22·70	53·6
80	50·0	19·50	52·1
90	53·3	14·00	47·4

In a general way, these tests show that with the greater work the tensile strength increases, while the ductility, as shown by the elongation, decreases. There is no evidence of any law in the figures found for the contraction of area.

A third series of tests was made with steel ingots prepared in the following way. They were forged down by 65 per cent of the original area, and then one half of their length was left intact, while the second half was worked down farther. The former half is termed *a*, the latter *b*, in the following table, in which the first group shows the results obtained by straining to fracture; while in the second, the elastic limit was first determined, and then the test continued until fracture appeared imminent:

FIRST GROUP.

Part *b*. worked to per cent.	Fracture in part		Elongation measured from center.		Contraction of area at fracture.
	a.	*b*.	In *a*.	In *b*.	
85	50·6	0	21·0	16·7	43·9
90	51·6	0	24·7	12·0	35·1
95	53·6	0	24·0	7·0	38·0
85	47·7	0	27 0	14·0	48·1
90	50·4	0	26·5	12·7	41·8
95	48·6	0	19·0	12·0	20·0

SECOND GROUP.

Part *b*, worked to per cent.	Elastic limit reached.		Load continued to.	Elongation measured from center.	
	In *a*.	In *b*.		In *a*.	In *b*.
85	36·0	34·4	49·7	18·75	17·75
90	33·6	34·7	48·7	19·50	16·00
85	32·4	36·4	45·7	16·50	10·00
90	37·5	37·5	56·4	8·50	7·25
95	35·2	40·7	57·9	16·00	7·25
95	39·2	41·6	61 5	18·00	8·75

The tests of the first group show a very great difference between the ductility of that half which was less worked, *a*, and the other half, *b*, worked down in different proportions, and fracture always took place in the former.

In order to show the effect of work put into steel, upon the contraction of area, Herr Brauns carried out the following tests. He forged steel ingots down to 65 per cent of their original area and then worked some

parts of it down farther, finally cutting a test rod from it cold. He forged down three equal sections of the ingot, so that there were in the length of the rod four parts worked less and four worked more, thus:

the heavy lines indicating the parts *a*, where more work had been put in, and the others *b*, with only 65 per cent. The following were the results:

Parts *a* worked down. Per cent.	Fracture in part.		Contraction of area. Per cent.				
	a.	*b.*	*a.*	*b.* Fracture.	*a.*	*b.*	*a.*
85	0	63·7	2·7	35·9	2·7	11·2	2·6
95	0	61·4	1·5	26·7	5·1	11 2	0·4
85	0	49·1	10·9	36·9	10·9	15·5	6·7
95	0	48·0	9·4	37·2	10 5	12·1	5·4

A second set of well-forged steel rods were slightly hammered cold with a light hand-hammer at a number of places, thus:

the heavy lines indicating the parts *a*, where the rods were struck. The results are given in the following table:

Fracture in part.		Contraction of area. Per cent.				
a.	*b.*	*a.*	*b.* Fracture.	*a.*	*b.*	*a.*
0	52·6	2·7	38·0	3 0	10·7	2·6
0	51·5	4·2	43·9	1·2	12·8	1·8
0	51·4	4·8	45·7	4·5	13·7	4·8
0	49·8	4·3	48·1	4·9	16·5	2·7
0	49·0	4·4	46·6	4·9	16·8	4·5
0	48·1	4·8	30·2	1·8	22·4	4·8

Herr Brauns explains the phenomena noted by the fact that the cold as well as the hot working caused the material to become denser, so that those parts resist a distortion better. But he argues that, if causes so small are capable of producing such results, then a system of testing which relies so much as does that of the German railroads upon a distortion of form, must be weak.

PROGRESS IN SCIENCE AND THE ARTS.

A Carriage for Melted Iron.—At a recent meeting of the Franklin Institute, Mr. F. Lawrence, of Philadelphia, described an arrangement designed by him to carry ladles of melted iron, which must be conveyed quickly and without spilling. Instead of a turn-table, a very short curve may be used, and a short curved length of supplemental central rail is used, slightly above the level of the two regular rails. Both wheels are rigid on each axle, and there is no swivel to either axle. But there is a central "fifth wheel" between the two main axles, and this swivels on a vertical pivot; and as it engages the central supplemental rail at the turn, the front wheels on the fore axle are raised clear from the regular rails, and the truck runs on three wheels, rounding the sharpest curves with ease.

Transmission of Power by Electricity.—A novel application of the electrical transmission of power has lately been made at the Trafalgar collieries, Forest of Dean. The electrical arrangements were carried out by the Pyramid Electric Company, under the supervision of their managing director, Mr. A. Le Neve Foster. In this case, an electric motor is used to drive a pump in the underground workings. The pump is employed for pumping the drainage water from some of the deep workings to the bottom of the shaft, whence the ordinary steam-pumps raise it to the surface. The total vertical lift of the electric pump is 115 feet, while the length of pipes through which the water is forced is some 500 yards. A dynamo-machine is placed on the surface, for generating the current for working the motor, and is connected with it by wires led down the shaft and along the workings, a distance of some 500 yards. Messrs. Brain are satisfied with the result of the undertaking, and propose still farther to extend the utilization of electricity as a motive power.

A New Explosive.—Mr. Charles W. Siemens has just patented a new explosive which is stated to be very powerful. The compound is a mixture of saltpeter, chlorate of potash, and a solid hydrocarbon, and is suitable both for mining purposes and fire-arms, while, if ignited in the open air, the combustion takes place slowly and imperfectly. It is stated that the incorporation of the ingredients is by preference effected as follows: The saltpeter, chlorate of potash, and hydrocarbon (for which may be taken paraffine, asphaltum, pitch, caoutchouc, gutta-percha, etc.) are mixed together in pulverulent form by passing through sieves or otherwise, and the mixture is then treated with a liquid volatile hydrocarbon, which acts as a solvent to the solid hydrocarbon. A plastic mass is thus produced, which is then formed into cakes or sheets by passing through rollers or otherwise, and is rendered hard by evaporating the liquid solvent used, the sheets or cakes so produced being then converted into grains or pieces of any desired size in the same manner as ordinary gunpowder. The new compound, which has about the same density as ordinary gunpowder, and is very hard, is said to possess with equal volumes more than double the explosive force of the latter. The intensity of explosion can be regulated at will by varying the proportions of the ingredients and the size of the granules. These proportions should, generally speaking, be such that for each volume of the hydrocarbon, when converted into a gaseous state, there shall be present in the other ingredients three volumes of oxygen.

The Behavior of Nitrogen in Coal during Destructive Distillation.—It is usually stated in text-books that coal contains about two per cent of nitrogen, which, when the coal is heated in close vessels, usually comes off as ammonia. Prof. W. Foster, however, who has brought his investigations before the Chemical Society, finds that only a small fraction of the total nitrogen comes off as ammonia. Durham coal was employed which contained 1·73 per cent of nitrogen, and left 74·46 per cent of coke. A weighed quantity of the coal was placed in a combustion-tube sealed at one end, and the issuing gas was washed free from ammonia by hydrochloric acid; the gas thus freed from ammonia was passed through a second heated combustion-tube containing slacked lime; the additional ammonia thus obtained came from the decomposition of cyanogen in the gas. Taking the total nitrogen in the coal as 100, only 14·5 per cent is evolved as ammonia, 1·56 per cent as cyanogen, 35·26 per cent is present in the coal-gas as nitrogen, while 48·68 per cent remains behind in the coke. Dr. Percy Frankland said that Dr. Hoffmann, in his report in connection with the Exhibition of 1862, stated that only one third of the nitrogen was evolved as ammonia, two thirds remaining behind in the coke; and, as far as he knew, nothing had been done with the subject until Mr. Foster had taken it up. He had made some combustions of the coal used by that gentleman, using the apparatus employed in the combustion of a water residue; about ·024 gram of coal was taken; great difficulty was experienced in getting all the nitrogen off.

A New System of Hauling Coal from Mines.—Mr. C. B. Finley, of the Kittanning Coal Company, in the Clearfield region, has perfected a system for hauling coal out of the mines of the company, which appears to be both simple and inexpensive. He utilizes the switching locomotive used on the tracks outside of the mine as the motive power for drawing the loaded cars from the mine, instead of a stationary engine. The power is applied in the following manner: From the place where the trains are made up, in the mine, to the outside is some 1200 feet. Under the track which extends between these two points is an endless wire rope, passing around a large drum at each end. To the drum on the outside is geared a large cog-wheel, which in turn is geared to four smaller wheels, which are so arranged under a side-track parallel to the main track that, when the locomotive is run on this side-track to the proper position, its four driving-wheels are directly over and its weight is resting upon the four smaller wheels. Accordingly, when the train of loaded cars, varying in number from twenty-five to forty, is made up at the bottom of the slope, the last car is clamped to the rope, the locomotive is run on the side-track outside and up on the friction-wheels, and consequently the drum revolves, and the train moves up out of the mine. When it arrives at the surface, the locomotive is run off the siding, is attached to the train, and performs its ordinary duties. One of the advantages of this arrangement over the stationary engine plant seems to be that, while the trains are making up in the bank, the engine can be used for other purposes, at other places.

Forestry Statistics.—Mr. C. S. Sargent, special agent in charge of the forestry statistics of the Census, has just issued a bulletin in which he gives a partial estimate of the consumption of wood for domestic use in the United States. He figures out the enormous aggregate of 140,537,439 cords, valued at $306,950,040. The States which consume the greatest quantity of wood are the following, in the order named:

	Cords.
New York	11,290,975
Ohio	8,191,543
Tennessee	8,084,611
Kentucky	7,994,813
Michigan	7,838,904
North Carolina	7,434,690
Pennsylvania	7,361,992
Wisconsin	7,206,126
Indiana	7,059,874
Alabama	6,076,754
Georgia	5,910,045
Virginia	5,416,112
Illinois	5,200,104
Mississippi	5,090,758
Texas	4,883,852
Iowa	4,090,649
Missouri	4,016,373
Arkansas	3,922,400
South Carolina	3,670,959

It will be noticed that even those Southern States which are known to have very large and valuable deposits of coal, and some of the Western States similarly situated, are still very heavy consumers of wood for domestic purposes.

The general consumption of wood in a number of other industries is as follows:

	Cords.	Value.
Domestic purposes	140,537,439	$306,950,040
Railroads	1,971,813	5,126,714
Steamboats	787,862	1,812,083
Precious metal mining	358,074	2,874,593
Other mining	266,771	673,692
Brick and tile	1,157,522	3,978,331
Salt	540,448	122,681
Wool	158,208	425,239
Total	145,778,137	$321,962,373

This does not include the consumption of charcoal, which is given as follows:

	Bushels.	Value.
In twenty largest cities	4,319,194	$521.316
Manufactures of iron	69,592,091	4,726,114
Precious metals	97,687	29,306
	74,008,972	$5,276,736

What an enormous quantity this is—and we are confident that it does not fully represent the total consumption—will be noted, when we estimate that charcoal weighs on an average 20 pounds per bushel. We then arrive at an aggregate weight of fully 750,000 net tons.

THE PEARL FISHERIES OF LOWER CALIFORNIA.—The pearl fisheries near La Paz, in Lower California, says the *Mexican Financero*, are not a recent industry, though they have recently attracted great attention. For more than twenty years, they have been pursued in a quiet and somewhat unsystematic manner, but have been the means of very large wealth to many families, who have controlled the riparian rights. Some remarkable pearls lately found there have excited much interest. Three such extraordinary events have taken place during the past month. Probably the largest pearl on record, weighing 75 carats, was found toward the close of December. The fisherman sold it on the spot for $14,000, which, however, was an insignificant sum compared with its real value. Now

Digitized by Google

comes the announcement that one of the fishermen employed has just discovered a finely tinted and perfectly formed pearl weighing 47 carats, and valued on the spot at $5000; while yet another pearl was found about the same time, smaller than the former, but of perfect shape, weighing 40 carats and valued at $3000. We have already remarked that American buyers have hitherto strangely ignored that promising district; but large European houses are represented by resident agents, under whose purchases all the products of these fisheries are shipped to European markets.

SHIPBUILDING IN ENGLAND DURING 1882.—It is calculated, says the *Iron and Coal Trades Review*, that upward of 783 vessels were launched in Great Britain during the year 1882, of an aggregate gross total of nearly 1,200,000 tons, a record considerably in excess of that of 1881, though that year was the most prosperous that had ever been known previously. Nearly all the vessels launched have been either of iron or steel, and very few have been sailers, the bulk of the latter being constructed on the Clyde. Wood as a material for shipbuilding is almost completely abandoned in England. Only two wooden vessels were built on the Clyde last year, one on the Tyne, and none on the Wear or Tees. The fact is well known that, year by year, our wooden shipping is rapidly decreasing in number and importance; for, as the vessels are removed from the register, their owners find it to their advantage to replace them with iron steamers. The old wooden collier, so common a few years ago in the London trade, is steadily disappearing, and the largest proportion of the coal conveyed is now in moderate-sized vessels, say of 800 or 1000 tons. In the days of wooden shipbuilding, New York was the second shipbuilding port in the world, Sunderland being the first; but the introduction of iron and steel has quite put the former "out of court," while Sunderland having adapted itself to the use of the new material, was last year the second most important district in the world, the Clyde being now the first, and the Tyne third, judged by the tonnage of vessels launched last year. As iron superseded wood, so steel is gradually superseding iron, many of the largest vessels being built of it. In fact, in 1882, there were 60 steel vessels launched, their aggregate gross capacity being 108,254 tons. Steel-makers are steadily cheapening the cost of production of plates, and thus reducing the difference between them and iron plates; and as engineers are much less distrustful of them than they were a couple of years ago, their use is naturally extending, principally on the Clyde, where in fact seven eighths of the steel vessels have been built, and one fourth of the tonnage constructed on that river during the past year has been of steel. In 1879, only 18,000 tons were built; in 1880, about 40,000 tons; in 1881, the increase was to 66,609 tons; and last year, to 108,254 tons.

GENERAL MINING NEWS.

ARIZONA.

COCHISE COUNTY—TOMBSTONE DISTRICT.

The latest reports state that Contention is taking out 90 tons of ore daily, the quality remaining the same as for the past month. The Empire shaft is nearly 500 feet deep, and it is expected that a heavy flow of water will be struck soon. Some ore was taken from near the surface of the Bradshaw mine last week, when the mine was attached and shut down by a creditor whom the company has owed for some time. The whim has been completed on the Rattlesnake mine, and some good ore is extracted.

GRAND CENTRAL.—At the annual meeting of the stockholders, the following directors were elected: Charles D. Arms, J. H. McEwen, Robert McCurdy, Youngstown; Thomas Struthers, A. J. Haseltine, Warren, Pa. The directors elected C. D. Arms President, and Robert McCurdy, Secretary and Treasurer.

PIMA COUNTY.

OLD DOMINION.—The company is now working vigorously all the groups of its mines in the district, the Old Globe, the Keystone, and the Black Copper. At the Old Globe, a fine body of ore is opening up on the first level, 215 feet from the surface, and from 30 to 40 tons of ore are daily extracted and sent to the furnace. The Keystone keeps two teams steadily hauling, and the Black Copper has just commenced sending ore. On the Black Copper claim of this group, the ledge has been stripped by two pits, respectively 75 and 90 feet in length, exposing the ore for a width of from 10 to 20 feet, and in depth, so far as developed, 10 feet. On the Copper Jack location, the ledge has been stripped 64 feet in length, showing an average width of 28 feet and a depth of 14 feet, with the extent downward yet to be determined. The ore, from numerous assays made, averages from 15 to 20 per cent in copper. One furnace is kept constantly running, the supply of water and coke being insufficient for two at present. After a successful run, furnace No. 2 has been closed down for general overhauling, and No. 3 furnace started up and is now in full blast.

PINAL COUNTY.

SANTA CATALINA.—This company, which has recently bought the O'Brien copper mines, is moving its smelter from the Santa Catalinas to the Gila River. The furnace will shortly start up. There is an abundance of wood at hand to make all the charcoal needed, and the Deer Creek coal-fields are near. This coal makes a superior quality of coke, and the company need not import the latter.

CALIFORNIA.

MONO COUNTY—BODIE DISTRICT.

BODIE CONSOLIDATED.—The official report for the week ended January 20th shows: Tons of ore crushed, 13,217; assay value of pulp, $45.32 per ton, that of ore being $252.33. The tailings averaged $6.63 per ton. Bullion shipped, $5558.60. The vein is very strong in the bottom of winze No. 3, and carries more quartz than when the winze was started. The south drift on the rich vein, 780 level, is in 140 feet. The water is decreasing somewhat, so that the pumps are making a little more than eight strokes per minute.

BULWER CONSOLIDATED.—The north drift from the west cross-cut is in 291 feet. The formation in this drift is very favorable.

STANDARD CONSOLIDATED.—The official report for the week ended January 20th shows: Ore extracted and shipped to mills, 1428 tons. Shipped to the company, $25,661.60. East cross-cut from south drift, 1000 level, is 224 feet long, and the face is still in hard blasting rock. South drift from east cross-cut, 700 level, is in 365 feet, showing the vein one foot wide. North drift from west cross-cut is 302 feet long, and is in favorable formation. Total length of south drift No. 1, 500 level, is 370 feet, and the vein is 9 feet wide. The uprise from this drift has reached a hight of 248 feet, where the vein is 12 feet wide. South uprise No. 2 is up 60 feet and shows ten feet of ore. North drift is 414 feet long. North uprise is up 258 feet, showing vein 10 feet wide. South drift No. 1, 385 level, is in 459 feet, where the vein is 6 feet wide. South drift No. 2 is 570 feet long, and shows the vein 4 feet wide. The different stopes show no important change.

SAN BERNARDINO COUNTY—PROVIDENCE MINING DISTRICT.

It is reported that large lead mines have been discovered in Timber Mountains, 100 miles north of Providence.

CANADA.

PROVINCE OF NOVA SCOTIA.

The intense cold weather that has prevailed during the month of January has materially interfered with milling operations throughout the various mining camps, although the underground work has steadily progressed.

HALL-ANDERSON.—The milling operations have been at a stand-still, owing to the inability of the coil-heater to keep the water from freezing the pipes. A large quantity of ore of better quality than ever is ready for the mill, and the mine throughout is looking well.

KENT.—This company is making arrangements to put up a dam on the Tangier River, so as to obtain power for a proposed 35-stamp mill. A large surplus of power, probably of several hundred horse, is expected to be rented by the company to other mills and factories. The underground work of this mine is ready to furnish ore to keep 35 stamps at work.

OXFORD.—The superintendent telegraphs that he has just cleaned up from ten days' run $2850, and opens the month with more ore on the dump, and of higher grade, than at the beginning of any previous month. Every thing running smoothly.

SATEMO.—The cold weather has rendered it impossible to keep the mill on full time; but the clean-up just reported for the month is $1800. All developments on the Kent lode show the lode to continue with regularity, both in width and in grade. The recent settlement made by this company for its claims against Clark & Bothwell places it in a strong financial condition.

WELLINGTON.—At a depth of 1200 feet, a cross-cut has been made, and only six feet away from the lode has been found another wider and even richer than the main lode.

A discovery of copper is reported to have been made at Malaquash Point, Cumberland County.

COLORADO.

CLEAR CREEK COUNTY.

CORA MAY.—Work is steadily pushing on this lode, on Seaton Mountain. The adit is now in 70 feet, showing a pay-streak of four inches (galena, iron pyrites, and gray copper) on the hanging-wall.

DIAMOND.—The Colorado *Miner* says that a vein showing a pay-streak of about ten inches of rich ore was struck in the tunnel recently, gray copper showing plentifully. Several sample assays were made which gave an average of 235 ounces silver and 30 per cent lead per ton. Since the foot-wall of this lode was intersected, the tunnel has penetrated a distance of nearly fifty feet through dike rock, in which have been opened three veins of unusually rich ore. This last vein, supposed to be the north vein of the lode, has now been penetrated a distance of about six feet, without reaching the north or hanging-wall. A large Baker blower has been purchased to supply ventilation for the tunnel-heading and to enable the working of the late intersected veins to be prosecuted without intermission. There is a large amount of ore on the dump.

POLAR STAR.—Work was begun at clearing out this well-known Democrat Mountain property, preparatory to systematic and extensive development, in the early part of October last. Three men are at work, and have cleaned out 650 feet of the lower tunnel, retimbered it, and laid new track where necessary. A contract has been let to sink a shaft sixty feet near the lower tunnel, from the bottom of which levels will be run. The tunnel was chambered out over the 128-foot shaft when the mine was worked before. This chamber will be retimbered and a 15 horse-power engine put up for hoisting and pumping.

LAKE COUNTY.

BIG PITTSBURG.—The company's properties are all worked on a lease. Colonel Bright, who has the lease on the Bates and Pierson shafts, is taking out some very fine lead carbonate ores. The Lent and Haytrosser shafts are also working successfully.

CATALPA.—The manager has shipped two car-loads of iron ore to the iron and steel works at Pueblo, where the ore is to be tested, and its value for making steel rails and merchant iron is to be ascertained. The ore all averages about five ounces in silver to the ton. For some time past, the shipment of iron ore has been an important feature of several of the Carbonate hill mines. The Catalpa mine has lately shipped 300 tons of iron to the Grant smelter at Denver, where it is used for fluxing purposes, and about 2500 tons to the smelters of this city, and other points along the Rio Grande Railroad.

CHRYSOLITE.—Two additional leases were let on the Chrysolite mine, January 28th. The first of these was let to Messrs. S. Ayres, Jr., and Frank Ballou, on the old workings about Colorado Chief No. 2 shaft. The other lease was let to Mr. J. C. Langhorne, one of the original discoverers of the Vulture mine, now one of the group of the Chrysolite consolidation. Mr. Langhorne has a lease on the southern portion of the Vulture, and anticipates doing well.

LEE BASIN.—The shaft-house and the machinery were destroyed by fire January 23d. The loss is estimated to amount to $12,000.

MIKE & STARR.—Since putting in the new pumping machinery, the shaft has been sunk to a considerably greater depth, and a drift started forty-five feet below any of the former workings. This drift has now advanced quite a distance to the eastward, and now will be turned toward the south. About fifty feet more of drifting, it is thought, will catch the vein in its south dip. In the mean time, the sinking of the shaft is continued.

ROBERT E. LEE.—Eight thousand tons of third-class ore, which will average about $25 a ton, are now on the dumps.

TERRIBLE.—The Adlaide mine, the property of this company, is looking better and making larger shipments of ore than ever heretofore. The mine for some time past has been making regular shipments of twenty-five tons of ore a day, netting from fifteen to twenty dollars per ton. The working force of the mine numbers about fifty men. At present, the mine shows a breast of ore twenty-five feet in hight and about thirty feet in width, also a large number of minor ore faces, all promising well.

OURAY COUNTY.

Mr. W. Weston, in a letter to the Denver *Republican*, speaking of the ores of Red Mountain District, says that the ores are of two kinds—galena and a copper ore that looks like an antimonial copper glance: that from the Hudson being of a very dark gray color, in fact nearly black; that from the Yankee Girl being of a gray color and associated with copper pyrites; and that from the Orphan Boy having the usual beautiful colors of erubescite, and all these having the appearance of solid masses of metal, without gangue in them, and not having the combed or banded texture noticeable in all the ores of our vertical fissure quartz-veins. I send you specimens herewith, commencing at the lowest point (as you ascend the valley from Ouray), at which I saw ore, the White Cloud mine; the altitude is 10,000 feet above sea-level; half a mile farther up are the Gustin and Robinson mines, altitude, 10,200; 300 yards farther up, the Yankee Girl, 10,300; 100 yards farther, the Orphan Boy, 10,350; then a mile and a half farther up the gulch, the Hudson, 11,100; and 2200 feet farther up, the Congress, 11,300. So, taking every thing I saw into consideration, I am of the opinion that the whole thing is an immense horizontal contact lode, having its outcrop on the side of this chain of Red Mountains, dipping slightly toward the east, or into the mountain, and pitching downward into the earth as you travel from south to north, or down the valley toward Ouray. Of course, subsequent development may prove them to be irregular segregated contact ore-deposits; but in the mean time, I incline to the former belief. True it is that similar ore has been discovered in the Roger and Champion considerably above the line described by the altitudes given above; but I have no doubt that the flat lode, if it is such, will be found to be faulted in place, by upheavals subsequent to its formation. I was unable to visit the two last-named mines.

Digitized by Google

SUMMIT COUNTY.

GRAPHIC.—A correspondent of the Leadville *Herald* states that an important strike has been made in the Crown Point mine, the property of the Graphic Company. The old workings of the mine consist of a tunnel several hundred feet in length, from which an incline was sunk upon the vein. In this tunnel and incline, considerable high-grade ore was developed, showing brittle and ruby silver. Some time ago, a new incline was started from the surface, under the direction of Manager Parker, of the Robinson mine. In the new incline, the vein was caught at a depth of fifteen feet, and carried down in the incline to a depth of seventy-five feet, where the vein left the incline. At a depth of about 125 feet, a drift was run, in which, at a distance of about sixteen feet, the vein has just been cut, showing twenty inches of high-grade ore, of which about two tons are already out and on the dump. The new strike adds greatly to the value of the mine, and, in connection with the large amount of ore developed in the old workings, renders it one of the most valuable properties in the Ten Mile District.

GREER WORKS.—The concentrating-works, at Kokomo, have started up, under the direction of Mr. William Penberthy, who has superintended their construction The plant consists of a twenty-stamp mill, with concentrating apparatus. The mill has received shipments of ore during its construction, and has now a great deal of ore on hand. The result of its workings will be of great importance to the Ten Mile District, which possesses immense quantities of low-grade ores, which it is expected that concentration will render available. The stacks of the Greer smelter have been sold to the Cañon City Company.

ROBINSON.—Mr. James W. Davis is now firmly installed as manager of this mine.

DAKOTA.

CALEDONIA.—The superintendent's report for week ended January 14th shows: Ore produced, 950 tons. South header advanced 3 feet; total, 37 feet. North drift advanced 9 feet; total, 60 feet. Very little work done in the winze, on account of using all the men to break ore for the mill. For week ended January 21st, he reports: Ore produced, 825 tons. Bullion shipped, 643 ounces gold; value, about $11,000. South header advanced 3 feet; total, 40 feet. North drift advanced 8 feet; total, 68 feet. Have not been able to do any thing with the winze, on account of the water freezing before leaving the mouth of the tunnel. As soon as the weather moderates, will renew sinking. Only forty stamps running at present, on account of crusher breaking.

FATHER DE SMET.—The superintendent's report for week ended January 15th (delayed in mail) shows ore extracted from first, second, and third levels, 2100 tons. Ore milled, 2100 tons. The widening of the third level header 5 feet is completed. The body of ore struck in the Golden Gate cross-cut is proving to be quite extensive. A chamber has been cut out 40 feet wide and 70 feet in length, to be known as Cook's chamber. In this chamber, at a point about 150 feet southeast from the McGinty winze, a winze has been started, to connect with the third level header. It will be known as the Italian winze, and has advanced 16 feet. The product of the mine for December, bars 149 and 150, was $47,892.12; superintendent's drafts for expenses, $19,000; net profit, $28,892.12. The report for week ended January 22d shows: Ore extracted from first, second, and third levels was 1715 tons, while 1865 tons of ore were milled. The Italian winze was advanced 6 feet, and is now down 22 feet. The third level header advanced 13 feet, and is 107 feet in.

SAVAGE.—Work is prosecuted with two shifts and air-compressors in the tunnel. The breast of the tunnel is in about 800 feet.

GEORGIA.

PIGEON ROOST.—The mill is running regularly on ore from the Ogle cut. Veins which show free gold were struck recently.

SINGLETON.—The five-stamp mill at the Lockhart mine is running on ore from the stope on the Findley ridge. Work at the new 20-stamp mill is pushed vigorously.

IDAHO.

EAST FORK MINES.—A correspondent of the Salt Lake *Tribune* says that these mines are situated near the head of East Fork of Salmon River, seven miles from Galena. Little has as yet been done in this new mining district. Several locations have been made and some work done on several of the prospects, such as the Tyrolese, Lyon, Carbonate, Washington, Langtry, Germania, and others, all of which look remarkably well and have good ledges and show fine ores in quantities. Considerable ore was shipped last season from this neighborhood from Germania and other mines. The ore is chiefly galena and carbonate, which assays from 150 to 600 ounces per ton and from 30 to 60 per cent galena. These mines can be very easily and cheaply worked. Smelters and concentrating-works are wanted in this district. Water-power is unlimited in the vicinity, and a great abundance of excellent timber for charcoal, mining, building, and other purposes.

MINNIE MOORE.—The Bellevue *Chronicle* says that a fine vein of ore two feet thick was recently cut in the cross-cut on the 150 level of this mine. The ore assays 116 ounces silver and 70 per cent lead. There is no end to the ore that can and will be shipped from this mine as soon as the railroad is completed to Bellevue.

MAINE.

DEER ISLE.—A special meeting of the holders of this company was held in Portland, on January 31st, for the purpose of reorganization, or to devise some other plan for relieving the company of its financial embarrassment.

STEWART COPPER.—A special stockholders' meeting will be held at the company's office, in Bangor, February 9th, to determine what disposition shall be made of the shares of stock remaining in the treasury.

MEXICO.

The *Imparcial* announces that at Parral, Chihuahua, Messrs. George Thomas, of San Francisco; J. W. Provard, of Arizona; J. Wiley, of New Mexico; and A. B. Sawyer, of Parral, with a number of Eastern parties, have bought the Jesus Maria for $227,000. The hoisting and pumping machinery and a part of the 40-stamp battery are on the way to the mines. Mr. J. W. Provard, of the Ward Mining and Milling Company, has finished the foundation for a Stetefeldt furnace and 40 stamps, in addition to the 15 now at work.

MONTANA.

JEFFERSON COUNTY.

ALTA-MONTANA.—The company's works at Wickes are running smoothly and steadily. At the Comet mine, they are working on a five-foot vein of ore that assays 79 per cent galena and 64 ounces in silver.

SILVER BOW COUNTY—SUMMIT VALLEY DISTRICT.

The Butte *Miner* says that operations at the mines during the past week have been considerably retarded by the extremely cold weather.

ALICE.—Work is pushed with the customary vigor. A strike was made in the south cross-cut of the Magna Charta 500, which is considered important. The cross-cut intercepted the south vein, and a three foot ledge of fine ore, characterized by heavy sulphurets, was uncovered, which assays 57·91 ounces in silver per ton.

CABLE.—From the face of the 2500-foot tunnel, which intersects the ledge at a perpendicular depth of 300 feet, east and west drifts have been forwarded for a total length of 100 feet on a body of high-grade gold ore, which has an average width of 40 feet. A 40-foot ore breast is now extracting. The clean-up in the mill for the past month, during which but fifteen and sometimes only ten stamps were in operation, is said to be about $50,000.

CLEAR GRIT.—The mine is still worked for development and uncovering the ore-bodies. The ledge in the west drift holds out and improves. A new ore dump has been built, and arrangements will soon be completed to begin milling the ores.

LEXINGTON.—The 500-foot station has been started and cross-cutting commenced to intercept the south vein. The mill is running steadily, with a larger average output than ever before, that of last week being ninety per cent of assays

MOULTON.—Work progresses steadily. The body of high grade in the winze west of the 400 cross-cut holds out in good shape, assays running from sixty to eighty ounces. The ore-house is full and the mill running steadily.

NEVADA.

EUREKA TUNNEL.—The tunnel is sending to the furnaces about ten tons of ore a day. The new double-compartment shaft, situated about 100 feet westerly from the main south drift, and 40 feet south of the main tunnel, is carried down as far as the work can be done, passing through limestone, spar, iron, and small veins of low-grade ore. Preparations are making to set up the engine, which is of 40 horse-power, and will be run by steam from a large boiler set up at the mouth of the tunnel. The main south drift has been run 225 feet on a seam in ledge-matter almost the entire distance, and shows spots of ore in several places, which will be thoroughly prospected as soon as a new air-connection is made with the surface, which at present is seriously contemplated.

SILVER STATE.—The tunnel is in 315 feet. A cross-cut is driving easterly into the hill in an open seam which is incrusted with water formation. Running even with this seam is a sort of ledge-matter, carrying quartz and iron very different from the gray limestone on each side of it. These indications are favorable.

THE COMSTOCK LODE.

CALIFORNIA.—From a report presented at the annual meeting in San Francisco, we take the following: In June last, some prospecting on our croppings having shown streaks of ore yielding fair assays, a winze was sunk for the purpose of ascertaining their value. The result has been the extraction of 610 tons 1910 pounds of ore, yielding bullion to the value of $10,122.80, or $16.58 per ton, this yield being 74 per cent of the assay value of the ore, no allowance being made for moisture. Work on the croppings was discontinued in December, and will be resumed as soon as the weather permits. Our other work has been confined to opening out and partially prospecting the 2500 and 2700 levels, in the accomplishment of which there have been hoisted from the mine 11,319 tons of waste rock. On the 1650, 1750, 1950, and 2300 levels, a large amount of work has been done, jointly with the Ophir Company and by the California Company individually, in repairing the various drifts and connecting winzes on and connecting these levels, it being necessary to maintain those air-ways for ventilating purposes. It has not been considered prudent as yet to reopen our old stopes. Our work the past year has demonstrated the fact that the Comstock lode in our lower levels continues to show great strength of formation, and the cutting of seams of quartz, giving assays, in the various drifts, on the 2500 and 2700 levels, shows that it is mineralized, with a probability of finding ore-deposits of value when the lower levels are fully opened. By the judicious use of the diamond drill, I have been able to avoid or control the influx of larger quantities of water than our pumping machinery could handle. The financial statement shows total disbursements, $233,369.40, including $51,553.81 for wages and salaries, $10,344 for compressed air, $51,905.28 for legal expense, $7450.70 for a suction-fan, $93,200 for construction of C. & C. shaft, $5498.59 for reduction, $2507.20 for hoisting, $2300 for water and ice, and $1996.80 for powder, caps, and fuse. The real estate, machinery, hoisting-works, and supplies on hand are about the same as shown in last year's inventory.

TUSCARORA.

The Tuscarora *Mining News* says that the work of developing and prospecting the mines goes on steadily. Evidences of the improvement of the known existing ore-bodies, and of the approach of drifts to ore-bodies not now developing, is constantly received. Grand Prize and Argenta are each doing important work. The North Belle Isle shaft has passed its 300 level, and is progressing downward at the rate of 11 feet per week. On reaching the 400 level, sinking will be stopped, when drifts and cross-cuts will be driven. Navajo, Belle Isle, and Independence are looking well. The ore-body in Navajo widens and improves in quality as depth is attained, while the drift in Belle Isle and Independence continually shows seams and bunches of good ore. The Elko Consolidated shows ore carrying a large percentage of gold. An average assay gives $101.29 in gold, and $91.66 in silver.

SOUTH CAROLINA.

HAILE.—The development of this mine continues to show the great extent of the newly discovered vein. It is fully forty-five feet wide, and seems to increase in value as they drive in on it. It now averages about $16 per ton. The stamp-mill has been run steadily through the month of January. The clean-up will show an increase of nearly fifty per cent on the December run. The new furnace is nearly completed, and will be working early in February. All of the concentrates now awaiting treatment will average $40 per ton, some of them running much higher. With the furnace and amalgamation-works running, it is a certainty that the monthly yield will reach $15,000. It is understood that another mine, known as the Gay mine, adjoining the Haile, is about to be opened and worked. From all accounts, it will prove equally good with the latter.

UTAH.

CRESCENT.—The Salt Lake *Tribune* says that the announcement was made during the week that this company had effected a purchase or consolidation of the Walker & Buckeye with its other mines, and it was true as far as the Jennings control in the Walker & Buckeye was concerned. But since then, there has been a suit filed by the Wahsatch Mining Company against the Jenningses, founded on certain transactions in 1877, which resulted in a judgment in the District Court at that time, ending in the sale of the mine by the United States marshal, when it was bought by William Jennings.

GERMANIA.—The company has stopped shipping lead to Salt Lake City, and will manufacture its lead hereafter into white-lead and pipe to a large extent.

MAMMOTH.—Operations at Tintic are pushed with energy. Besides the erection of additional furnaces, the work of erecting the refining-works for the copper matte goes on energetically, and is so far advanced that the manager has gone East to purchase the machinery necessary for the copper refining process.

NEW COMPANIES.

The following companies have filed articles of incorporation:

Baltimore Mining Co. Capital, $5,000,000; shares, $25 each. Operations, Summit County, Utah. Directors: S. D. Connor, William H. Knox, Park City; W. P. Lynn, F. R. Jones, S. J. Lynn, and James McGregor, Salt Lake City; and Patrick Eagan, Park City. Principal office, Salt Lake City.

Cosmopolitan Mining Co. Capital, $3,000,000; shares, $20 each. Operations, Alturas County, Idaho. Directors: Samuel P. Connor, J. C. Conklin, James McGregor, and Hugh Anderson. Principal office, Salt Lake City.

Lexington Mining Co. Capital, $500,000; shares, $5 each. Operations, White Pine County, Nevada. Directors: John W. Epley and George F. Hill, Washington, D. C.; William W. Libby, W. W. Wood, Frank Hoffman, Salt Lake; and J. H. Johnson, Evanston, Wyoming. Principal office, Salt Lake City.

WISCONSIN.

NEW COMPANIES.

The following companies have filed articles of incorporation:

Consolidated Vanderbilt Mining Co. Capital, $1,200,000; shares, 120,000. Operations, New Mexico. Incorporators: The Imre Brothers, Oluf M. Meyer, John Teich, Charles Mitchell, John Mitchell, Alexander G. Gordon, Henry M. Wilmott, and Christopher C. Fletcher.

Digitized by Google

Jackson County Iron Co. Capital, $6,000,000; shares, 6000. The object of the company is the mining and milling of iron and lead, and the quarrying of stone. Incorporators: J. A. Instead, John C. Spooner, and A. J. Goss, of Hudson. General office, Hudson, Wis.

ANNUAL FINANCIAL STATEMENTS.

We give below some additional reports of the financial standing of mining companies. These statements are taken from affidavits filed with the County Clerk, and are, therefore, accurate:

	Indebtedness.	Reporting Officer.
Achi Mining Company	$1,000.00	W. R. Wade, President.
Adams Prospecting Company	None.	W. B. Dickerman, President.
Alpine Silver Mining Company, of Colorado.	20,000.00	Horace Waldo, President.
Alturas Consolidated Mining Company	9,750.00	T. R. White, Jr., Secretary.
Amador Pacific Gold Mining Company	None.	Warner Van Norden, Sec'y.
American Flag Gold Mining Company	5,500.00	A. J. F. Van Deventer, Sec'y.
Amie Consolidated Mining Company	10,000.00	Robert Sewell, Vice-President.
Animas Silver Mining Company	None.	Lindley M. Hoffman, Sec'y.
Arizona Consolidated Copper Company	350.00	Frank Rudd, Secretary.
Atlanta Hill Gold Mining and Milling Company	19,000.00	S. B. Johnston, President.
Aurora Gold Mining Company	13,000.00	Thomas C. Platt, President.
Bassick Mining Company	25,000.00	William S. Hoyt, Secretary.
Beaton Silver Mining Company	5,000.00	Everett Clapp, Secretary.
Beauce Gold Mining and Milling Company.	7,500.00	Eugene Howard, President.

FURNACE, MILL, AND FACTORY.

The universal and the 18-inch rolls at the Union Rolling-Mills, Carnegie Brothers & Co., Limited, Pittsburg, were put in operation a few days ago.

Experiments are making at the Edgar Thomson and the Cambria steel-works to take molten pig from the blast-furnace directly to the Bessemer converters, after the system largely practiced in England and on the continent. It remains to be seen whether the blast-furnaces can be made to produce sufficiently uniform in grade and quantity to carry out this plan.

The Midvale Steel-Works, Philadelphia, have made some improvements in the dies used in the becking and punching department, which will lessen labor considerably, and will do away with the cost of two heatings.

The East Tennessee Valley Zinc Company, organized a short time ago with a capital of $300,000, let the contract a few days ago for the erection of furnaces and buildings in Knoxville. Several thousand tons of zinc are already mined a few miles from Knoxville. The furnaces will be in operation by next spring.

A second bar of open-hearth steel, 6 inches wide, ¼ inch thick, and 300 feet long, was recently rolled at the Superior Rolling-Mill, Alleghany, for the United States Spring Motor Company, of Philadelphia.

Krupp's works, at Essen, now employ some 439 steam-boilers; 456 steam-engines, with an aggregate horse-power of 18,500; eighty-nine steam-hammers, weighing from 200 pounds to 50 tons; twenty-one rolling-mills; machines for making tools, 1622; furnaces, 1556, of which fourteen are high furnaces; twenty-five locomotives, and five propellers, with a tonnage of about 8000. Annual production, 300,000 tons steel and 26,000 tons iron.

The strike at the Wabash mill, Terre Haute, Ind., begun on November 4th, is still in progress. The men struck for $6 per ton, and now some of them have gone in for $5.50.

The number of works in the United States engaged in the manufacture of cut nails, spikes, and tacks is 76, employing altogether 4323 machines, and the works and machines are divided among 14 States, as follows: Maine, 1 establishment and 30 machines; Massachusetts, 11 establishments and 663 machines; New York, 2 establishments and 55 machines; New Jersey, 2 establishments and 187 machines; Pennsylvania, 28 establishments and 1366 machines; Virginia, 4 establishments and 86 machines; West Virginia, 6 establishments and 630 machines; Kentucky, 1 establishment and 80 machines; Tennessee, 2 establishments and 102 machines; Ohio, 9 establishments and 625 machines; Indiana, 4 establishments and 182 machines; Illinois, 4 establishments and 264 machines; Nebraska, 1 establishment and 26 machines; Colorado, 1 establishment and 27 machines.

The Springfield Iron Company, at Springfield, Ill., has stopped making iron and steel rails. It is preparing for the manufacture of steel plates, bars, and forgings.

The works of the Joliet Steel Company, at Joliet, Ill., are now completely idle.

The new steel plant of the Indianapolis Rolling-Mill Company, is nearly completed. It will begin rolling rails on March 1st.

The Onondaga Tube Company has been organized at Syracuse, N. Y., with a capital of $25,000.

The first shipments of hoop-iron have left the new rolling-mill at Duncansville, Blair County, Pa.

The furnace of the Kirkland Iron Company, near Utica, N. Y., has been entirely rebuilt, and was put in operation on the 1st of January. It is 65 feet high, and 13 feet in diameter at the bosh, and is supplied with iron stoves for heating the blast.

Messrs. W. D. Kelly & Sons are running their Grant furnace, at Ironton, O., on West Virginia coke, in place of charcoal. They are going to change to coke after remodeling.

The Cleveland rolling-mill has resumed work in its steel and rail departments

FINANCIAL.

Gold and Silver Stocks.

NEW YORK, Friday Evening, Feb. 2.

The mining market has been rather dull and featureless this week, though some of the low-priced shares have been largely dealt in. Prices have been very irregular for all stocks during the week, but a tendency was shown to-day to better prices. There is no change to note in the Comstocks, they having been dealt in in sympathy with the San Francisco market. The Leadville stocks have shown some strength under a large business. The Tuscaroras have not been as strong as usual, but are still held in favor. Sierra Grande has been very active and was quite strong to-day. The sales of mining shares at all the Exchanges aggregate 449,560 shares, against 606,100 last week.

The Comstock shares have had a moderate business, but at very irregular prices. California has been very active and irregular, selling from 25@20@21c. Consolidated Virginia records a moderate business at irregular prices; it sold from 68@48@52c. Sierra Nevada was quiet and irregular at $3.65@$2.60 @$3.80@$3.25. Union Consolidated sold to the extent of 475 shares at $3.40@$2.30. Ophir was quiet; assessment-paid shares sold at $2.90, and assessment-unpaid shares at $1.38@$1.15. Consolidated Imperial sold at 9@11c., with a small business. Belcher records one transaction at 88c. Hale & Norcross sold at $3. Best & Belcher had a small business at very irregular prices; it sold from $4@$3.50@$4.10. Sutro Tunnel has been quite active at irregular prices, selling from 24@21c.

The Leadville stocks were moderately active at steady prices. Amie has been active and strong, recording sales of 38,700 shares at 18@22c. Chrysolite, under a large business, has been very irregular; it sold from $1.60@$1.45. Dunkin was quiet and steady at 22@26@25c. Iron Silver records small transactions at strong prices; it sold from $2.60@ $2.80. Leadville was quiet and strong, selling from 59@70c. Little Chief had a small business, and was steady, selling at 48@42c. Little Pittsburg records sales of 589 shares at 72@68c. Big Pittsburg has been quiet and strong, selling from 14@17@16c. Climax sold from 10@9c., with a small business.

The Bodie stocks record a small business at steady prices. Bodie Consolidated was quite strong, selling from $1@$2@$1.75, with transactions of 1250 shares. Bulwer had a fair business at irregular prices, selling from 95@90@93c. Standard has been very irregular under a small business, and has sold from $6⅛@ $5¾@$6. Goodshaw has been quiet and steady at 6@8c. Bechtel sold at 5c.

The Tuscarora stocks have been quiet and irregular. Grand Prize, with a moderate business, has been very strong, selling from 72c.@$1. Belle Isle was quiet and a little weak, selling from $1@90c. Navajo has suffered a decline from $8¾@$7¾, with transactions of 2600 shares. North Belle Isle was quiet and strong, selling from 62@91c. Independence records a moderate business at steady prices, selling from 72 @75c. Elko Consolidated has been active and weak; it sold from 22@14c., with a business of 13,400 shares. Tuscarora was quiet and strong at 18@20c.

In the miscellaneous list, Alice has been fairly active at strong prices, selling from $2.40@$2.55@ $2.45. Eureka has suffered a decline from $11@ $9¾, under a small business. The Green Mountain stocks have been quiet and steady. Gold Stripe sold at 7@6c. Green Mountain has been active and strong at 54@61c. Rising Sun sold at 7@5c., and Cherokee at 6@5c. Hall-Anderson records a fair business at irregular prices; it sold for $1.35@$1.45@$1.60. Horn-Silver has also been irregular, under a fair business, and has sold from $7⅝@$6¾@$7, Prussian has been active and strong; the sales amount to 4100 shares at $4.30@$4.65. Robinson Consolidated records an active business, but has grown weak; it sold from $1.25@ 95c.@$1.10, closing at the latter figure. Sierra Grande has had a large business at very irregular prices; it sold from $2.50@$2.05@$2.75, closing firm at $2.65 to-day.

Albion has been quiet and irregular at $1@$1.50 @$1.35. Alta-Montana has suffered a decline, under a small business, selling from 22@15c. Bradshaw records a fair business, and has grown a little weak; it sold from 37@33c. Decatur has been very active and has suffered a slight decline from 12@8c. Harlem Mining and Milling Company has been moderately active at steady prices, selling from $1.10@$1.05. Hortense records a small business at steady prices, selling from 16@14c. Oriental & Miller has been active and steady at 16@15c. Silver Cliff has been very quiet at steady prices, selling from 38@60c. Sonora Consolidated records a very active business to-day at 11@15c. South Pacific was active and steady, selling from 8@9c. The State Line stocks were very quiet and about steady; Nos. 1 and 4 sold from 4@3c., and Nos. 2 and 3 from 7@ 8c. Taylor-Plumas was active and steady, selling from 17@19c.

We have received from Mr. F. M. F. Cazin, of Ely, Vermont, a letter in which he begs us to warn the public not to invest in the present Vermont Copper Mining Company on the basis of a report made by him and dated July 26th. The parties now in possession—without right, as Mr. Cazin claims—are the same who, according to his statement, had in former years embarrassed the company by mismanagement. Mr. Cazin's statements as to the future of the property, in his report, are based on the supposition that the new management would be in the hands of parties capable of grasping and coping with the technical and financial difficulties of the problem. Mr. Cazin incloses a letter, dated January 31st, and addressed to the Mutual Trust Company of this city, in which he warns them against issuing or delivering any of the 2500 $100 bonds as per agreement of January 22d, 1883, with the Vermont Copper Mining Company, on the ground that a recent conveyance made by the Vermont Copper Mining Company is illegal and invalid for a number of reasons, one of which is, that creditors of the former company representing claims of $90,000 have not waived their right to interfere, and therefore have a prior claim, so that the new mortgage bonds are practically without security.

MEETINGS.

Bull-Domingo Consolidated Mining Company, No. 115 Broadway, New York. Annual meeting of stockholders and election of trustees, February 17th, at twelve M.

Fairmount Coal and Iron Company, No. 58 South Third street, Philadelphia. Annual meeting of stockholders and election of trustees, February 14th, at twelve M.

Digitized by Google

Gold Placer Mining Company, No. 60 Broadway' Room 11, New York. A meeting of shareholders, February 9th, at twelve M.

Kittanning Coal Company, No. 328 Walnut street, Philadelphia. A special meeting of stockholders, March 1st, at twelve M.

Locust Mountain Coal and Iron Company, No. 224 South Third street, Philadelphia. Annual meeting of stockholders and election of trustees, February 26th, at twelve M.

Maryland Coal Company, No. 104 Broadway, New York. Annual meeting of stockholders and election of trustees, February 6th, from twelve M. to one P. M.

Silver Islet Consolidated Mining Company, No. 52 Broadway, New York. Annual meeting of stockholders and election of trustees, February 6th, at twelve o'clock M.

Socorro Milling and Mining Company, No. 3 Broad street, New York. Annual meeting of stockholders and election of trustees, February 5th, at twelve M.

PIPE LINE CERTIFICATES.

Messrs. Watson & Gibson, Petroleum and Mining Brokers, 55 Broadway, furnish the following *résumé* of the oil market for the week. It is a singular fact that on Tuesday, when Shannon No. 5 well in Forest County was announced as a new producer of 1425 barrels the first twenty-four hours, the market should have rallied within a few hours from 96⅛c. to $1.03⅝ the highest price of the week.

The general sentiment in the oil-producing regions is, that oil is worth $1 per barrel, and the bulls point to the rapidly declining production of the Reno, the Schultz and Reed and Brenneman wells in proof of their assertion that production is falling below the daily consumption.

Bears, however, claim that the demand and supply are about equal; that new wells in Forest County will offset declining production of old wells; that "wild-cat" wells opening up new territory are always likely to come in at an unexpected time; that the present stock on hand is the largest ever known, and that, as money is tight in Oil City and Bradford, holders will conclude to realize soon on the present steady market.

The general public is coming into oil speculation more than ever before, and it would now appear that prices made in the New York exchanges will soon have an influence on Oil City prices, and finally that New York will control quotations. The margin required to buy oil is from fifteen to twenty cents per

Digitized by Google

barrel, or $150 for every thousand barrels bought or sold.

The following table will show the fluctuations of the market during the week:

	Opening.	High-est.	Lowest.	Closing.	Sales.

Total sales...					4,152,000

REVIEW OF THE SAN FRANCISCO MARKET.

There is no news of interest from the San Francisco market. The Comstock shares were quite active and strong at the beginning of the week, and then suffered a sharp decline, but reacted and closed a little firmer. There is no news from the mines. The Tuscaroras were quiet and firm. The news from the mines continues favorable. The Bodie stocks have shown a little strength, especially Bodie Consolidated, which has been quite strong under a fair business.

Copper and Silver Stocks.

Reported by C. H. Smith, 15 Congress street, Boston, Stock Broker and Member of the Boston Mining and Stock Exchanges.

BOSTON, Feb. 1.

The market the past week has been heavy, and quotations show generally lower prices, especially on the copper stocks. Quincy takes the lead in the decline, selling from $59¾ down to $50¾, ex dividend $6. Calumet & Hecla also seems to be weak, from no special reason except a lack of buying orders, and some pressure to sell the stock by parties desiring to realize. Franklin is the only stock on the list showing an advance, and that only 50 cents per share, selling at $14½, against $14 last week. The report of this company, made up to the 1st instant, shows that it had on hand copper valued at $258,767.10, and supplies worth $69,000, making a total of $327,767.10. Its outstanding liabilities, at the same time, were $94,905.60, leaving on hand a surplus of $232,861.50, out of which it is very probable that a two-dollar dividend will be declared. Osceola declined from $31@$30, but later rallied again to $31. Huron sold at $1⅞, and Allouez at $2.55. There is no disposition to deal in the speculative copper stocks, and holders will be under the necessity of keeping their stocks until, in the dim future, something turns up to bring them to life again.

In the silver stocks, the dealings are confined to only a few specialties. There has been a little more activity in Bonanza Development, and the price has advanced from $2¼@2¾ on sales of about 3000 shares. Catalpa and Crescent hold their own very well, the former selling at 97½c.@$1.02½, and the latter at 42½c. Both companies are reported as looking well, and the Catalpa will doubtless continue the payment of quarterly dividends for some time to come. There has been a steady demand for San Pedro this week, and nearly 5000 shares have sold at 60c. Sullivan sold as before at $1. Harshaw sold at 50c., and is in better demand at $⅝ bid. The stockholders of the Harshaw have directed their trustees to expend $10,000 in prospecting the company's property at the point where the two veins would unite if their lines were carried out. The company has a surplus over all liabilities of about $80,000, of which about $10,000 is in supplies on the property.

At the Mining and Stock Exchange, transactions have been light and prices generally lower. Massachusetts & New Mexico continues steadily to decline, and sold to-day at 16c. Empire, dull at 28@30c. Deer Isle, 12@14c. Pipe Line Certificates declined from $1.04¼@98¾c., but later advanced to $1.03.

3 P.M.—The market this afternoon was without any special feature. Catalpa sold at $1.05. Pewabic sold at $9. Quincy declined to $50. Bonanza sold at $2.75. Closing prices: Calumet & Hecla, $242 bid, $243 asked. Catalpa, $1.05 bid, $1.07½ asked. Franklin, $14 bid, $14½ asked. Huron, $1¾ bid, $1⅞ asked. National, $1½ bid, $1¾ asked. Osceola, $29 bid, $31 asked. Quincy, $50, asked. Silver Islet, $6 bid, $6⅞ asked. Sullivan, $⅞ bid $1 asked. San Pedro, 57½c. bid, 60c. asked.

BULLION MARKET.

NEW YORK, Friday Evening, Feb. 2.

The Exchanges on India having improved, the London market for silver was correspondingly advanced the past week, as indicated by the figures of rates current here, given in annexed table. The lower rates for India Exchange and silver in London on the opening of the year stimulated imports from India, and thus caused a recovery in value of silver.

BULLION PRODUCTION FOR 1882.

We give below a statement showing the latest bullion shipments. These are officially obtained from the companies, where that is possible; and where official statements can not be procured, we take the latest shipments published in those papers nearest to the mines reported. The table gives the amount shipped for the week up to the date given, as well as the aggregate shipments to such date from the first of January, 1882.

The shipments of silver bullion are valued at $1.29·29 per ounce troy; gold at the standard $20.67 per ounce troy. The actual value of the silver in the following table is therefore subject to a discount, depending on the market price of silver. If the price of silver be counted at $1.12 an ounce, which has for some months been about its average value, the following figures, where they relate to silver bullion, should be diminished by about 13½ per cent, to arrive at actual value.

MINES.	States.	For the week.	Month of December.	Year from Jan. 1st, 1882.

Bullion Receipts at New York.—The bullion received from the mines at the various offices in this city during the week ended February 2d, as compiled from various sources, amounted to $288,263.71, as against $260.320.97 reported for the previous week. The receipts from January 1st, 1883, to date, are $1,671,878.49.

Exports and Imports of Gold and Silver at New York.

Exports.

Week ended January 27th	$251,745
Corresponding week last year	236,400
Since January 1st, 1883	1,058,814
Corresponding period last year	1,060,680

Imports.

Week ended January 27th	$383,444
Corresponding week last year	47,708
Since January 1st, 1883	542,476
Corresponding period last year	339,075

Foreign Bank Statements.—The governors of the Bank of England, at their weekly meeting, made no change in the bank's minimum rate for discount, and it remains at 4 per cent. During the week, the bank gained £308,000 bullion, and the proportion of its reserve to its liabilities was raised from 44½ to 47 13-16 per cent, against 31½ per cent at this date a year ago, when the rate of discount was 6 per cent. February 1st, the bank made a further gain on balance of £17,000 bullion. The weekly statement of the Bank of France shows gains of 13,250,000 francs gold and 1,100,000 francs silver.

United States Assay-Office at New York.—Statement of business for the month ended January 31st, 1883:

Deposits of gold:		
Foreign coin	$210,000.00

IRON MARKET REVIEW.

NEW YORK, Friday Evening, Feb. 2.

All departments of the iron trade are in a state of absolute quietude, and look with hope to the relief which the adjournment of Congress is expected to give. Whether business will then take a fresh start, remains to be seen.

American Pig.—Both buyers and sellers hesitate and seem uncertain how to act. This is clearly shown by one transaction of magnitude which took place this week, 5000 tons of Thomas iron selling with the understanding that the price shall be the market price at time of delivery. Our quotations remain universally for standard to choice brands at tide-water, $24.50@$26; for No. 1 Foundry, $22.50@$23.50; and No. 2, $20.50@$21. Outside brands may be obtained at a concession, and some lots of foreign Forge have sold very low. Nothing has been done in Bessemer pig, which is nominally $22.25@$22.50. England cables lower, 52s.@54s. 6d. Spiegeleisen is dull and slack, with 20 per cent at $32.75@$33, and 10@12 per cent $27@$28.

Scotch Pig.—The market is fairly steady, with prices showing a slight upward tendency, due to a feeling that freights will advance, although they are still 4s. from Glasgow to New York. The demand is fair, but poorer brands are being stored. We quote: Coltness, $25@$25.50; Langloan, $24.25@$24.75; Glengarnock, $22.50@$23; and Eglinton, $21@$21.50. At the Wall Street Exchange, the cables are nearly the same; Carnbroe, 55s. 3d.; Gartsherrie, 63s. 6d.; Summerlee, 62s.; Coltness and Langloan, 66s.; Glengarnock, 56s.; and Eglinton, 49s. 9d. Warrants are 47s. 8d.

Steel Rails.—There are occasional sales of small 3000 to 5000 lots at firmly $40 at mill, and in one instance an 8000-ton order for prompt delivery was declined because of the inability of the mill to deliver promptly. Yesterday, the failure of the Union Iron and Steel Company at Chicago, capable of producing 150,000 tons of rails per annum, was announced. It was due to mismanagement, and the appointment of a receiver is expected to stop the low sales of that mill, which have been a troublesome feature in the market for some time. It is not expected that the mill will be closed down for any length of time. London cables £4 15s.@£5.

Old Rails.—A good many rumors are afloat of sales at low figures, $23 being frequently mentioned as the basis of transactions, which we have not, however, been able to trace to any reliable source. There have been offers to buy several lots at $24.50, and we quote $24.50@$25.

Scrap.—Very little is doing. We quote, nominally, $25 ex ship.

Philadelphia. Feb. 2.

Pig-Iron.—Transactions in iron for the past six days have lacked usual interest. A few large consumers have bought freely of foundry iron especially, and a few mill-owners have placed contracts for forge iron which will carry them into the spring. The demand would be much larger but for the uncertainty of tariff legislation. Opinions differ as to the outcome of it. It is the intention of the iron men to fight the question over until next winter unless the House bill is accepted. No. 1 Foundry sold this week as low as $24.50. Better grades sold at $25, and some few special brands brought $25.50. Confidence continues among makers of special brands. Concessions are possible only for inferior brands. Mill irons are moving a little more freely than last week, though chiefly of better brands. The purchasers who use such brands are a little apprehensive that prices might harden on them in case tariff legislation was favorable to manufacturing interests. Furnace prices, in some transactions, are, for future delivery, $20.50; for others, $20. Sales have been made as low as $19, though exceptional, and even this figure has been shaded. Middlesborough has sold at $19; small lots, $20. Scotch iron is moving a little more freely, though in small lots, for foundry purposes, at $22.50@$26.50. Importers have inquiries for fair-sized lots, which will probably be placed. Bessemer is $22.50@$23, according to quotations, but there are parties in the market with offers as low as $21.50, and they expect to make arrangements at that figure for future shipments.

Manufactured Iron.—The demand for finished iron is not improving as makers would desire; but since Monday a fair amount of business, chiefly in small orders, has been booked for near-by delivery. Manufacturers are satisfied that the demand will be such as to keep their capacity fully engaged. Buyers are out of iron, and running along in a retail sort of way, waiting for something to happen which will either harden prices or weaken them. A large amount of work is in hand, and the lack of confidence is not so bad as newspaper reports would make it appear, although there is a great deal of feverishness and dissatisfaction with the way tariff matters are piddling along. Small lots of iron are selling at 2·40c. Country mills have been known to take business as low as 2·10c. These figures cover the extreme limits. Average quotations may be set down at about 2·30@2·35c. for a good iron. Skelp iron is weak, and very little business can be reported. Blooms are without any activity, and weak. A few contracts are worked up, but consumers are not rushing in with fresh contracts. Muck Bars are weak and fluctuating around $38, though some special qualities are held at $39.

Wrought Pipes—Are moving a little more freely at 65 per cent off list, though business is by no means satisfactory, and some few orders for boiler tubes at 55 off. Sheet-iron is improving quietly, though the capacity is still unfilled. Makers have fair inquiry, and, as soon as buyers feel it safe to come in, will book up for a winter and spring output. Card rate runs from 4@4·34c. ordinarily for gauges 16 to 28. Buyers of large lots have had offers at sharp concessions on these rates.

Shapes.—A very little fresh business has been done in structural iron. Manufacturers report a fair amount of business in sight, and a probability of the usual volume during the spring and summer; but excuses are made which delay business and keep quotations weak at about 2·12c. for angles.

Plate and Tank Iron.—Quotations are 2½c. for Tank. Flange, Shell, and Fire-Box are called for in small quantities, to finish out the work in hand. The indications point to a very fair demand, and all consuming establishments are busily (?) engaged on work enough to keep them running for the winter. Steel rails are quoted at $40. Limits are, perhaps, $39@$41, though the tendency is upward. The correspondence of late shows up well, and some heavy railroad building will be pushed during this summer.

Old Material.—Tees are quoted at $25; Double-Heads, $27.50; American, $27@$28. Transactions are small, and negotiations are in hand for spring shipment.

Scrap.—Scrap continues dull and transactions of but little consequence. Yards are well supplied, and sellers are willing to make concessions on inferior stuff to get rid of it. Business has been done all the way from $25@$28. For ordinary No. 2, $26 is paid; and for No. 1, $27@$27.50.

METALS.

NEW YORK, Friday Evening, Feb. 2.

Copper.—The market for lake copper is steady at 18@18½c. It is learned now, by way of England, that some time ago 17c. was refused to parties there by the Lake companies for a mixed lot. In other words, the market is somewhat unsettled through the

Digitized by Google

forced sale of 16c. Holders of Baltimore and Lake copper decline, however, to part with their metal at such figures, and for these 16¼@16¾c. is the ruling quotation. It is stated that the Copper Queen Company declined to sell a 100,000-pound lot at 17c.

It is learned that a number of Arizona mines, four being mentioned by name, have closed down, owing to inability to obtain the necessary supplies of coke and to other troubles.

At the recent meeting of the Canadian Copper and Sulphur Company in London, it was stated that the company has made a trial contract to deliver 12,000 tons of cupriferous pyrites to a New York concern, the price being kept private.

London cables lower, Best Selected £72@£72 5s., and Chili Bars, £64 15s @£65.

Tin.—The market is firm, although moderate business not exceeding 150 tons during the week has only been done. We quote spot Straits, cash 21c. London cables £92@£92 5s.

Lead.—The market has stagnated, and beyond a small jobbing trade, absolutely nothing has been done. We quote nominally 4·60c. for Common, and 4⅝c. for Refined, although any larger lots, say 300 to 400 tons, could not be placed at these figures. London cables £13 10s.@£13 15s., for English Common.

Messrs. John Wahl & Co., of St. Louis, write us as follows to-day :

Our market has declined slowly since our last report. Sales will aggregate 200 tons Refined, at 4·25c. We quote Common nominally 4·20c.

Spelter.—This market continues dull and lifeless. We learn that a large producer at La Salle has offered to deliver spelter in March at 4·65c. We quote 4·65@4·75c. London cables £15 15s.@£16.

Antimony.—With sales of about 100 cases, this metal has declined further to 10@10⅛c. for Hallett's, and 11@11⅛c. for Cookson's.

STATISTICS OF COAL PRODUCTION.

The above table does not include the amount of coal consumed and sold at the mines, which is about six per cent of the whole production.

COAL TRADE REVIEW.

NEW YORK, Friday Evening, Feb 2

Anthracite.

The market has been exceedingly quiet and flat, and the only transaction of interest, as shedding light upon the present situation, is the awarding of the contract called for by the Commissioners of Charities and Correction. The quantity involved was about 35,000 tons, 26,000 of it being broken, with some stove and egg, all to be delivered to institutions in the harbor. The contract was awarded to Messrs. David Duncan & Son, at the uniform price of $3.82 per ton, delivered alongside of dock, equivalent approximately to $3.62 on board, the freights in summer and winter, extra towing, demurrage, etc., figuring up at least to an average of 20 cents per ton. The two other parties bidding offered to take the contract at $4.09, alongside.

The only feature of interest is the fact that, in order to supply the blast-furnaces in the Schuylkill and Lehigh valleys with lump coal, of which they were short, it has been decided to work full time next week. This may be satisfactory to the furnaces, but it does not strengthen the moral effect which restriction is supposed to have upon buyers of other sizes. The three days' stoppage arrangement is not looked upon with favor by many in the trade, and it is a question well worthy of serious consideration whether it is not by far better to stop all work for a week or two or three, if necessary, at a time, rather than struggle along in the present fashion.

The Baltimore *American* has the following :

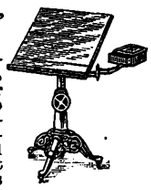
Mr. Charles F Mayer, President of the Consolidation Coal Company, was yesterday presented with a handsome testimonial in the shape of a solid silver punch-bowl and salver, made by Kirk, and valued at about $2000, by the coal trade of Baltimore. The presentation was made the occasion of a dinner to Mr. Mayer, which took place at the Merchants' Club, at which there were present as invited guests Messrs. John W. Garrett, President of the Baltimore & Ohio Railroad Company ; Senator Henry G. Davis, of West Virginia ; Hon. Lloyd Lowndes, Mr. Enoch Pratt ; Messrs. D. S. Jones, President of the Piedmont Coal Company, of Philadelphia ; William Jacques, President of the New Central Coal Company, of New York ; A. H. Stump, President of the George's Creek Coal and Iron Company ; Simon Rosenberg, President of the Atlantic Coal Company ; James Boyce, President of the Maryland Union Coal Company ; Stephen S. Lee, of the Swanton mines ; Gilmor Meredith and Benjamin Barroll, of Gilmor Meredith & Co. ; John K. Shaw, of Shaw Brothers ; John A. Boyce, Harry Lee ; H. Crawford Block, Treasurer Potomac Coal Company ; Charles W. Keim, Secretary and Treasurer of the Consolidation Coal Company ; and Decatur H. Miller. Mr. S. S. Lee, presided, and in behalf of the coal trade presented the testimonial to Mr. Mayer, taking occasion to compliment that gentleman on his recognized and valuable services to the coal trade generally, and congratulating him on the present status of affairs in the Cumberland coal regions.

Bituminous.

The bituminous coal trade is very quiet, and notably Clearfield coal is offering more freely at a concession, which is by some parties in the trade believed to be due to some arrangements of favorable rates made with the Pennsylvania Railroad. We quote Clearfield, alongside, $4.50@$4.65 ; and Cumberland, $4.65@$4.85, according to quality.

In giving a list of the miners of George's Creek Cumberland coal last week, we inadvertently omitted the name of the National Coal Company, operated by Messrs. Hitchins Brothers, of Frostburg, Md.

Horsford's Acid Phosphate
gives strength where there has been exhaustion, and vigor in place of impaired vitality.



FOR SALE.

Gold Mining Machinery.

COMPLETE MINE EQUIPMENTS.

Thirty-eight-Stamp Mill ; two Engines and Boilers, 60 and 30 horse-power ; Clayton Air-Compressor ; Ingersoll Rock-Drills ; Blake's Crusher ; Ore-Feeders, Tools, and Plant. In part or in whole, deliverable in Nova Scotia.
Apply to **C. A. SCOTT, M.E.,** P.O. Box 482, Halifax, N. S.

RANKIN, BRAYTON & CO.,
General Offices and Works, San Francisco, Cal.
Branch Works, Chicago, Ill.,
BUILDERS OF
MINING MACHINERY.
Plants for Gold and Silver Mills, embracing the latest and most improved machinery and processes for base and free ores. Water-Jacket Smelting-Furnaces for silver, lead and copper ores, with new and important improvements, superior to any other make. Hoisting-Works. Pumping-Machinery, Chloridizing Furnaces, etc. We offer our customers the best results of thirty years' experience in this special line of work, and are prepared to furnish, from San Francisco or Chicago, the most approved character of Mining and Reduction Machinery, superior in design and construction to that of any other make, at the lowest possible prices. We also contract to deliver in complete running order, Mills [illegible], Hoisting-Works, etc., in any of the Mining States and Territories. Estimates given on application. Send for illustrated circular.

Advertisers' Index	x

IT is announced by telegraph from Mexico that the National Mining Society was duly organized on the 6th inst. We have already, in a previous issue, alluded to the aims of this new association.

A VERY important addition to our available supplies of Bessemer ores is promised from the mines which the Hudson River Ore and Iron Company is about to open south of Hudson, in this State. It is said to be a siderite, running about 48 per cent of iron, one half of one per cent of sulphur, and 0·025 of phosphorus. The vein is reported to be 18 feet thick, and has been traced by Prof. JOHN C. SMOCK, of the New Jersey Geological Survey, over a distance of four miles.

THE programme of the Boston Meeting of the American Institute of Mining Engineers has been announced. There will be an evening session on Tuesday, the 20th inst., two sessions on Wednesday, one on Thursday, and one on Friday. The subscription-dinner will take place on Thursday evening. A number of excursions have been planned by the local committee, of which Gen. F. A. WALKER is President and Prof. R. H. RICHARDS Secretary. The visits to the Watertown Arsenal, where the famous Emery testing-machine will be inspected ; to the Leavitt pumping-engine, and the Norway Iron-Works will prove particularly interesting. A large number of papers have already been announced, and from the reports we hear from all quarters, the attendance will be exceptionally good, so that there is every prospect of a very successful meeting.

MR. HORATIO C. BURCHARD, Director of the Mint, who advocates a cessation of the coinage of silver at the present rate, and who opposed the issue of new bullion certificates on the ground that there was no need for an increase in the coin or paper circulation in the country, has submitted the following eloquent figures :

AMOUNT OF CIRCULATION FEBRUARY 1ST, 1883.

	In treasury.	In banks and active circulation.	Total.
Gold bullion	$51,449,382	.....	$51,449,382
Silver bullion	3,761,958	.....	3,761,958
Gold coin	121,868,451	405,510,541	527,378,992
Silver dollars	97,530,969	37,874,111	135,405,080
Other silver	27,135,244	53,428,257	80,563,501
Gold certificates	25,107,300	47,669,640	72,776,940
Silver certificates	4,306,650	68,438,820	72,745,470
U. S. notes	33,592,236	313,088,780	346,681,016
National bank notes	10,486,291	350,972,860	361,459,151
Fractional currency	7,101	7,010,992	7,018,093
	$375,245,582	$1,283,994,001	$1,659,239,583

THE managers of the Ontario Silver Mining Company, of Utah, have issued a circular in which they announce that, for the present, the payment of dividends will be suspended. There is nothing alarming in this conclusion ; in fact, it is another ample proof of the well-deserved confidence which the officers have in the permanence of their mine. During 1881 and 1882, the property, besides yielding $1,700,000 dividends, paid for permanent improvements to the extent of $500,000, and increased the accumulated surplus from $39,500 on April 1st, 1881, to $238,000 on December 1st, 1882. It has now been decided to purchase the ground adjoining the Last Chance, being an extension of the Ontario property, and to obtain the control of the Utah Eastern Railroad and the coal mines with which it is connected, in order to receive a permanent supply of cheap fuel. It is estimated that these additions to the property of the company will cost about $550,000, or $350,000 above the cash in hand. This sum the mine will have to earn before dividends can again be paid and a good surplus be accumulated. On the basis of past earnings, this would take a little more than half a year.

SCHEDULE C, on metals, has been finally reached by the House of Representatives in its discussion of the Tariff Bill submitted by the Ways and Means Committee ; and although it began its work on the 6th, it has not as yet done much. It has rejected Mr. KELLEY'S attempt, seconded by representatives from some of the Southern States, to make the duty on iron ore 60 cents per ton, and adhered to the 50 cent rate. The House declined to allow an extra protection of $3 per ton to charcoal pig-iron makers, and on the other hand rejected a proposition to reduce the duty on all pig to $6 per ton. The duty on Bessemer, open-hearth, basic, and other steel, except crucible metal ingots, blooms, billets, and slabs, has been changed from 0·6 cent per pound to 45 per cent *ad valorem*, while steel rails have been cut down to $15 per ton. Rails seem to have become the pet object of tariff reformers, and their zeal is carrying them so far that their position in the list, compared with the raw material, is entirely a false one. Charcoal bars, blooms, and billets are to come in under a duty of $22 per ton, while slabs, blooms, and billets of iron made with other fuel, are to be protected by a 35 per cent *ad valorem* rate. Bar iron, according to size, is to be dutiable at from 0·9 to 1·2 cents per pound.

On the whole, the revision of the Ways and Means Committee's bill, thus far, has been a surprise to those who professed to know the position of the majority in the House of Representatives. The result of the many close votes thus far has been a patchwork, the inconsistencies of which even the most ardent reformers will find it impossible to defend. Even they can not wish either of the bills to pass in its present form, and the prospect that no final action will be taken during this session of Congress will be a relief to all, because it will afford the time for an equitable adjustment. It is much to be deplored that business should be forced to languish to a certain degree, pending the settlement of the tariff question ; but we believe that the industries of the country will gladly submit to a delay if there is any hope that a wise and just measure will be ultimately framed.

CORRESPONDENCE.

[Communications will be noticed only when accompanied with the full name and address of the writer. Unless specially desired, only initials will be printed. We invite criticism and comment by the readers of the ENGINEERING AND MINING JOURNAL. Replies not intended for publication should be addressed to the Editor of the ENGINEERING AND MINING JOURNAL in blank, stamped, and sealed envelopes.]

The Export of Copper from Imported Pyrites.

EDITOR ENGINEERING AND MINING JOURNAL :

SIR : I must once more trespass on your space to explain a statement that I made in your correspondence column last week in regard to the disposition of the copper produced from Canadian pyrites.

In making the statement that "the entire copper product of the imported Canadian pyrites is eventually handled by the Orford Nickel and Copper Company and sold entirely as refined ingot copper," I fear I may have misled some of your readers in regard to the market that this ingot eventually seeks. I desire to add particularly *that it is all sold in a foreign market.*

EDWARD D. PETERS, JR.,
NEW YORK, Feb. 5. Assistant-Manager O. N. & C. Co.

Mr. Peters's statement confirms the main point which we desired to make in our review, namely, that the copper produced from imported pyrites was exported and did not therefore seek a market here. We were erroneously under the impression that the bulk was shipped as *matte*, while in reality it is sold as refined *ingot* copper.—EDITOR ENGINEERING AND MINING JOURNAL.

MINING STOCKS IN 1882.

We present this week a list giving the highest and lowest prices and the aggregate of sales of mining stocks in this city, together with the dividends paid by companies whose stock is dealt in. The list does not include dividend-paying mines which are exclusively quoted on other exchanges, nor those which are known to be making returns to their stockholders, nor the mines which are on a paying basis but do not publish statements of their results. Our dividend list enumerates a number of companies which have failed either by mismanagement, impoverishment, or in pursuance of a sound business policy to pay dividends.

The most striking feature which a rapid glance at both of our tables will show is the general decline in values; only a very small number, the very best known, steadiest producers, like the Calumet & Hecla, Ontario, etc., escaping the general depression. In some cases, as in Hall-Anderson, values were artificially advanced by "corners" which had nothing to do with the mine or its representatives. Among the mines which have temporarily or forever ceased to pay dividends are the Alice, which has spent the year in accumulating funds for the payment of machinery and a debt contracted by the acquisition of mining claims; the Amie, which appears to be yielding round profits to lessees whose time soon expires and who are probably taking out ore as fast as they can; the Chrysolite, which has been prospecting for new ore-bodies; the Dunkin, which at one time during the year reported good developments which have not since been realized; the Green Mountain, which has been hampered with a debt and apparently by a lack of ore-reserves; the Hibernia, which has passed into the hands of the sheriff, and is struggling with reorganization schemes; the Indian Queen, the Gold Stripe, the Plumas, and the Rising Sun, the last three collapsing with the Green Mountain, the Robinson Consolidated, the Spring Valley, the Starr-Grove, which went under as soon as the bolstering hand of its managers was withdrawn; the Stormont, which was wrecked by the same parties; and the Tip Top. Other mines, like the Tombstone and the Vizina, stopped paying dividends during the year, and as yet show no symptoms of resuming. Others have fallen off, like the Catalpa, from $120,000 in 1881 to $30,000 in 1882; the Eureka, from $225,000 to $87,500; the Northern Belle, from $387,500 to $225,000; Quicksilver common and preferred, from $525,491 to $280,313; and the Standard, from $975,000 to $725,000, due to the exhaustion of the rich ore-bodies. Not one of the Comstock mines paid a dividend, and under the pressure of regular and heavy assessments, values have gone down to low figures. The Tuscarora stocks, including the Argenta, Belle Isle, Grand Prize, North Belle Isle, Independence, Navajo, and the Tuscarora, now Elko, have latterly improved in consequence of good reports. During 1882, the Navajo paid $750,000 in dividends, against $250,000 in 1881, while the Northern Belle fell off from $387,500 to $225,000. The Dakota gold mining companies did well during 1882, Homestake paying $562,500 in 1882 against $360,000 in 1881; Deadwood-Terra, $205,000 in 1882 and $180,000 in 1881; and Father de Smet, $190,000, against $200,000 in 1881. Among the Leadville stocks, Iron Silver fell off from $500,000 to $400,000, while La Plata improved from $180,000 to $195,000, and Leadville from $20,000 to $80,000. The most prominent mine in returning dividends was the Horn-Silver, yielding $1,200,000. The additions to the list during 1882 were the Prussian Mining and Milling Company, and the Sierra Grande. The Moose has fallen into the hands of the sheriff. In the non-dividend list, there are very few, if any, that seem likely to reimburse the stockholders. Quite a number are worthless, having been sold out by the sheriff, and others are loaded with a debt from which they can not recover. The sales recorded are probably in many instances not based on actual transactions; and in this respect, the American Exchange has acquired an unenviable notoriety.

GOLD: ITS OCCURRENCE AND EXTRACTION. *Embracing the Geological and Geographical Distribution and the Mineralogical Characters of Gold-bearing Rocks; the Peculiar Features and Modes of Working Shallow Placers, Rivers, and Deep Leads; Hydraulicking; the Reduction and Separation of Auriferous Quartz; the Treatment of Complex Auriferous Ores containing Other Metals; a Bibliography of the Subject; and a Glossary of English and Foreign Technical Terms. By* ALFRED G. LOCK, F.R.G.S. *With six double-page Maps and 185 Engravings in the Text.* London and New York: E. & F. N. SPON. 1882. Royal 8vo, pp. 1229. A Geographical and a General Index.

This magnificent work is a model of its kind. It not only supplies a want in our technical literature, but does this so fully and completely as to satisfy the most exacting student. The work of John Arthur Phillips has been out of print for some time; but this is more comprehensive and thorough than that ever was. We are astonished at the proofs of Mr. Lock's patient and intelligent industry which these pages present. The list of books and of living authorities which he cites is evidence of the exhaustive character of his inquiries; and the compilation of this vast material has been executed with critical judgment. Careful indexes facilitate the use of the work for reference, while the student who may desire even more detailed information than its ample pages afford is guided by the bibliographical catalogue to the works of special authority and pertinence. It ought to be in the library of every mining engineer; and we had almost said that its possessor might get along without any other books on the subject of which it treats—at least, so far as the important outlines of history and present practice are concerned. We find in it, for instance, a description of the most recent really practical processes, such as the Mears and the De Signolles.

It is not to be wondered at if the editor of so great a work resigns, to some extent, the judicial function, and adopts or quotes the statements of others, without attempting to decide upon their value. He is trying to give an account of what has been done or is doing; and not a text-book for the dogmatic instruction of beginners. Mr. Lock has figured and described a number of amalgamating processes, for instance, which scarcely deserve to have their distinctive features thus immortalized, the real classification of pans, into big pans and little, grinding and non-grinding, pans all of iron or partly of wood or stone, well-built pans and rickety ones, being the one which in practice supersedes no end of patented confusion; and many of the devices for treating gold ores, heralded in the newspapers, and transmitted to posterity in books, being dead and orgotten in the mining districts before they become famous in literature. Yet we are pleased to notice how much of this sort of rubbish Mr. Lock has managed to omit, and how well he has, on the whole, covered the field of actual approved practice.

But practice is constantly advancing; and no one could safely go to a book a year old to get drawings for a gold-mill of the latest and best form in all details. If this were all that the book before us contained, it would still possess a high present value, but would necessarily decline in usefulness with the lapse of a few years. But the greater part of this large volume is filled with accounts of the gold-bearing regions, and a history of the gold-mining industry in all countries of the world. We know of no single work, not merely; we know of no single library in which this information can be found; and to find it presented, as it is here, in fullness, clearness, and order, is indeed a boon for which the mining engineer should be grateful. The chapter devoted to this subject occupies 745 pages, and is packed with interesting details of geology, history, industrial methods, laws, and statistics. About 100 pages are next given to a summary of the theories advanced during the last twenty years to account for the origin and formation of gold in veins and alluvial deposits, and for the occurrence of nuggets; a systematic epitome of the gold-bearing geological formations; and a catalogue of associated minerals. The following five chapters deal respectively with shallow placers, deep placers, hydraulicking (which, we are sorry to see, Mr. Lock spells without any *k*), stamp-milling, and the treatment of sulphurets.

The *résumé* of theories, above alluded to, comprises a full abstract of the views of Rosales (Victoria), Hartt (Nova Scotia), Hunt; the famous paper of Wilkinson, supporting Selwyn's hypothesis, and the supplementary papers of J. Cosmo Newbery on the formation of nuggets; also the paper of Skey (New Zealand, 1872) on the same subject, and that of Sonstadt on the gold in sea-water; and those of Whitney, Egleston, and J. S. Newberry. The quotations made from these sources cover the most important views announced in late years as to the genesis of gold, except the contribution of Prof. Henry Wurtz to this subject, which is worthy of greater attention than it has received from technical writers. But Professor Wurtz, after all, does not radically differ, as to the later stages of the deposition of gold, with the geologists and chemists of Australasia, who have taken the lead in the experimental elucidation of the question. His peculiar hypothesis of a sulphatic ocean belongs to an earlier stage than they undertake to consider.

We congratulate Mr. Lock and his publishers on this splendid piece of work. And if any body who reads this article suspects that we are deliberately praising the book in order to make people buy it, his suspicion is correct. That is just what we are doing; and Conscience, looking over our shoulder, says we are doing right.

THE LAW AS AFFECTING MINING AND METALLURGICAL INTERESTS.

Permanent Machinery.—An action was brought by certain creditors against the owner of land on which there was a steam-engine and accompanying machinery, which were annexed to a building by the owner for permanent and habitual use in smelting lead ore and manufacturing it into pig-lead. In this case—Thomas *vs.* Davis—the Supreme Court of Missouri decided in favor of the grantee of the land. Judge Henry, in the opinion, said: "Between grantor and grantee of land, if the fixture is one to become a part of the realty, it must be so firmly annexed that its removal would involve the destruction, impairment, or substantial injury to the freehold; and the manner of annexation would seem to be a material question. The offer, on the trial, to show that it was the custom to regard machinery for making pig-lead as chattels was properly ruled out. The intention in making the annexation to the freehold is to be determined by the consideration of the character of the annexation, and its appropriation and adaptation to the use or purpose of that part of the realty with which it is connected."

Superintendent Borrowing Money to Pay Miners.—The superintendent of a mine owner borrowed money at a bank to pay the miners, and executed notes in the name of his principal for the loan, and sent letters and telegrams to his principal, at his residence in Cincinnati, advising him of what he had done. No replies were received from him. Upon a refusal to pay, the bank brought suit on the notes and recovered judgment. The defendant appealed to the Supreme Court of Colorado, which also decided the case—Breed *vs.* First National Bank of Central City—in favor of the bank. The Chief-Justice (Elbert), in the opinion, said: "1. Greenleaf, in his work on Evidence, said: 'If a letter is sent by post, it is presumed, from the known course in that department of the public service, that it reached its destination at the regular time, and was received by the person to whom it was addressed, if living at the place and usually receiving letters there.' This presumption has also been held to apply to telegrams. 2. The silence of Breed upon the receipt of the letters and telegrams will, by presumption, ratify the acts of his agent. And it was proper to show, for the purpose of charging Breed, and as bearing upon the question of ratification, that the money borrowed was expended in his business and to his advantage."

MECHANICAL ORE CONCENTRATION, PNEUMATIC OR HYDRAULIC.

Written for the Engineering and Mining Journal by S. B. Krom, New York.

(*Concluded from page* 56.)

Let us now examine the true principle on which success in ore concentration is founded and on which our present practice is based. It is based indeed on a fluid of intermediate density, but not in accordance with the idea furnished by the theoretical opponents of pneumatic concentration—namely, on the principle of free fall, as free fall performs but very little if any part in effecting separation in our present practice. Its basis is well explained by the distinguished Councilor Althans:

"The dynamic effect of a living force produced by an upward jerk through the dense medium has a more energetic effect than by free fall." At every impulse, the medium is raised to a density, or its equivalent, to lift or act upon the lighter of the minerals, and the dynamic effect of the upward jerk ceases before the heavier mineral is materially affected. Thus, with water as a medium, the liquid is raised to the necessary intermediate density from 60 to 120 times per minute; with air as the medium, from 500 to 680 times per minute.

1st. If we begin with a medium sufficiently dense to support the lighter of two minerals without motion, we find it will not succeed in practice; or if we employ air and water, and give them continuous motion, to produce the required density, we find that this does not succeed in practice either.

2d. If we should undertake to give intermittent motion to a medium having a sufficient density to support the lighter minerals without motion, this would not prove effective; and if we select a medium whose density is between mercury and water, and give it intermittent motion, as in our successful practice, we should find it impossible to separate, except coarse grains of mineral possessing a wide difference in specific gravity, and could give but few impulses per minute. If we take water as the medium, we can increase the number of impulses, giving from 60 to 120 per minute, and can separate minerals of less difference in gravity and finer particles. Further, if we had a medium between water and air, we could separate still finer grains and of less difference in specific gravity, and give probably say about 280 impulses per minute. But with air as the medium, we can separate minerals of still less difference in specific gravity and still finer grains, and give from 500 to 600 impulses per minute—500 being about the best limit.

The logical conclusion is, that that medium is best which permits being brought to the required intermediate density the greatest number of times per minute. Such a medium not only effects a more rapid separation, but will separate finer grains and minerals possessing less difference in specific gravity.

The greater number of impulses which can be given by air is an advantage, and an evidence of greater capacity. This quality, which allows such rapid repetition, is indisputably an evidence of superiority, because an impulse given by air is equal, so far as the power of the impulse to act on the ore is concerned, to an impulse given by water. In practice, the extra number of impulses given by air is divided between capacity and closer separation.

Councilor Althans, in his Centennial Report, has forcibly indorsed these views. The favorable opinion expressed on the Krom Pneumatic Separator Mr. Cazin endeavors to break by asserting that the councilor was ignorant of Mr. Cazin's treatise and that of Professor Bartlett when he wrote his Centennial Report. Mr. Cazin also makes the remarkable statement that not only the water-jig can make 600 strokes per minute, but also works with increased effect, without requiring the same velocity. "Water-plungers work with increased effect," says Mr. Cazin. Will he please explain how? Is he not aware that the inherent adhesion which water produces between the particles of ore and itself prevents the full effect of the action of the impulse, and diminishes rather than increases it?

That Councilor Althans, who was one of the judges of Group I in the Centennial Exhibition, was not so ignorant as Mr. Cazin tries to make him, in spite of not having read Mr. Cazin's treatise on that subject, is shown by the complimentary remarks of Dr. R. W. Raymond, who called his report "a model of intelligent criticism, and even as a manual of art far superior to any thing we possessed in the English language before its appearance." At any rate, Councilor Althans came to his conclusions from close and attentive personal observation of the work of the pneumatic machine, and not from reading my publications.

The treatise of Professor Bartlett came into Councilor Althans's hands, it is true, after he wrote the theoretical part of his treatise contained in the Centennial Report; but he added a paragraph. He says: "It must not be overlooked that in pneumatic jigging the equal falling grains suspended in the stream of air are always in narrow air-spaces, similar to those in Krom's experiments," etc. Besides this, some time after the Centennial Report, the same treatise was enlarged and published in German, in which the councilor repeats the same favorable remarks on the pneumatic system.

"Where, then," exclaims Mr. Cazin, "are the effects hitherto unknown which the pneumatic system produces different from those in water-dressing? Althans quotes none. Where are they to be found, these

unknown effects? But it is peculiar to the Krom system that its defense moves in darkness and secrecy. It is based mainly on the ignorance of the auditory and on the favoritism of its attorneys." Such eloquence, such crushing and concentrated logic, are certainly overwhelming if not convincing.

I have sold machinery openly, and it has been open for inspection. I have published sufficient information about the pneumatic system, to give a clear idea of the correct theory, and have exhibited at fairs and at the Centennial Exhibition. My laboratory for concentrating samples of ore has always been open for any who wished to examine the workings of the pneumatic concentrator. I do a great deal in testing ores, and my guarantees of results are based on such tests.

"It is based mainly on the ignorance of the auditory and on the favoritism of its attorneys," says Mr. Cazin. I must confess, I have had some very ignorant auditors, and have found it difficult to convert some. Among the most deplorable in ignorance of my auditors I must class Mr. Cazin.

"I have failed," says Mr. Cazin, "to find, as yet, unrevoked praise anywhere, except from Mr. Trippel and from Mr. Althans." It would be sufficient, and also quite satisfactory to me, if such authorities as Councillor Althans and Professor Trippel find no reason for withdrawing their praise. But the statement of Mr. Cazin that praise has been withdrawn is totally untrue, which will appear as we advance.

Mr. Cazin, in the continuation of the criticisms, lays much stress on a publication in the London *Mining Journal* of 1878, written by Mr. G. W. Baker, the former editor of the Central City *Herald*, and purporting to be a review of what had been accomplished in eight years by the Krom pneumatic concentrators. In referring to the just-mentioned article, Mr. Cazin did not give his readers the full text, but merely what suited his purpose. It is to be regretted that Mr. Cazin, who boasts of a scrupulous honesty of purpose, could not see the unfairness of such a proceeding, more especially when ordinary intelligence would recognize that the paper was written by a disappointed man, whose whole desire was one of revenge because of his failure to force me into a contract with him for a concession of territory in which to erect new works on my plans, for which, as he stated, he had interested some friends with himself. After reiterating his early and sincere services for the pneumatic system of concentration, of which he offered himself to be the champion voluntarily, as he says, but nevertheless receiving full pay for all he ever did, and in addition many acts of kindness of a practical nature from me (gifts of money, I mean), he gives a so-called review of the history of the works built on my plan, and with the evident purpose of showing its inferiority. But has he made out a single case? Does he not himself admit that the abandonment or idleness of some of them was in consequence of "unsound business conduct," while the reference to the disaster of others, such as conflagration or the want of ore, has absolutely nothing to do whatever with the principle or merit of my system? Mr. Baker complains of not having authentic reports in some cases; but this can hardly fall on my head, inasmuch as I am unable to force those mining companies who use my machinery to publish reports for the benefit of the public. In what other case would this be done by other companies? It is simply ridiculous in Mr. Cazin to reason that, because of the temporary inactivity of some of my works, the system involved is a failure. How many wet concentrating works are in the same condition, especially the ones built by himself? And yet no sane person will denounce wet concentration because some of these works are inactive or have been closed.

The only case which would actually seem to need any explanation on my part is that of the Manhattan works. In that case, the results are fully on record. It is also on record what the results of working the Austin ore at the Star Cañon mill were before the Manhattan Company decided to build the large works at Austin. It was fully demonstrated that these latter results were entirely satisfactory, and they were supervised by Messrs. Curtis and Trippel at the time. If somewhat similar ore had been used subsequently, the result would have been the same. But instead, ore-stuff from the refuse-heaps was treated, which was absolutely worthless for any purpose, and difficult for any kind of separation. Yet by my machinery, that ore became valuable and paid, and if the agreed percentage in the result had been the main object, it could have been obtained in all of the tests, and was obtained, which will be seen in some of the following tables (the agreed percentage being 75):

44 tons 151 pounds, assay value per ton $29.21, total value $1,288.16

Pounds.	Assay per ton.	Total value.	
3456 of No. 1 concentration	$84.82	$146.56	
2584 of No. 2 concentration	207.35	353.36	
1822 of No. 3 concentration	204.21	159.96	
7353 of granular dust	58.11	210.21	
6484 of chamber dust	48.69	157.85	$1,027.94
Loss in tailings			$260.22

Percentage saved, 79·7.

A general sample of the above lot fixed the value per ton at $27.22, which is quite high enough for this ore.

With the assay value of $27.22, the saving on the above lot is 85·63 per cent.

Third Run, 15 tons, 1823 pounds.—15 tons 1823 pounds, assay value per ton $25.12, total value $399.69

Pounds.	Assay per ton.	Total value.	
1550 of No. 1 concentration	$100.53	$77.81	
1309 of No. 2 concentration	146.63	95.66	
771 of No. 3 concentration	120.93	46.61	
3374 of granular dust	57.13	79.50	
2283 of chamber dust	36.28	41.35	$340.93
Loss in tailings			$58.76

Percentage saved, 85·3.

51 tons 228 pounds, assay value per ton $82.20, total value $4,200 42

Pounds.	Assay per ton.	Total value.	
5832 of No. 1 concentration	$281.15	$819.83	
5413 of No. 2 concentration	413.12	1,116.04	
2967 of No. 3 concentration	375.43	556.95	
13,428 of granular dust	147.63	990.98	
7341 of chamber dust	109.95	408.75	$3,887.55
Loss in tailings			$312.89

Percentage saved, 92·55.

The quality of ore in the last table is similar to that (but lower in value) on which the guarantee of 75 per cent is based. But the economical considerations were better served to have a less and richer quantity of concentrations, even at the expense of some higher loss. With that sole exception, and here only partly, there is not one example introduced by Mr. Baker which would show in the least any fault in my system.

But the want of good faith on the part of Mr. Baker is evident by the very fact that he seeks to make a contract with me, and for me to give him rights such as he would undoubtedly himself denounce as unsound business conduct. If my system is so faulty, why does Mr. Baker inveigle his friends into furnishing capital for a new Krom works, and why does he admit that he expects to have satisfactory results from such a new Krom works? I can not ask for space in your JOURNAL to relate all the details in reference to the works built on my plans; but I am ready at any time to give any desired explanation to those who feel interested in knowing the truth.

Mr. Cazin further criticises my experiments, made and published in your JOURNAL, by which I obtained results in practice (whatever the theory may say) superior to those obtained in wet dressing, when we consider the prevailing theory, that equal falling grains in water are not equal falling in air. We must also consider that this was based on air at rest, and therefore the erroneous inference that water was the superior medium. But when the air is made equal in resistance to water by giving it motion, then grains equal falling in water should also be equal falling in air, and experience has demonstrated that in air there is a margin in its favor.

In these experiments, I followed the examples of Rittinger, who worked out results, and then went back and corrected the theory to accord with the results in practice.

I have already alluded to and shown the incorrectness of Mr. Bartlett's assertion, that my experiments have been made improperly, which assertion is then imitated by our hero Cazin. I am, however, satisfied that had Mr. Bartlett made practical investigations, as I did, he would have arrived at similar results. He would have found that the air-current in my jigs is maintained with great uniformity, and, in the language of Mr. Baker, "with the automatic regularity of a pendulum."

Mr. Cazin next compliments Mr. Bartlett as author for the following theories: "That medium is the best for the separation of two substances for which the ratio of diameters of equal falling squares is greatest; or, in other words, that medium is best which will separate most readily spheres of two substances nearest in size." I would here ask the reader, whether it would not rather be common sense to say, that the medium is best which can separate two bodies that have the *greatest*, and *not* the *smallest* difference in size?

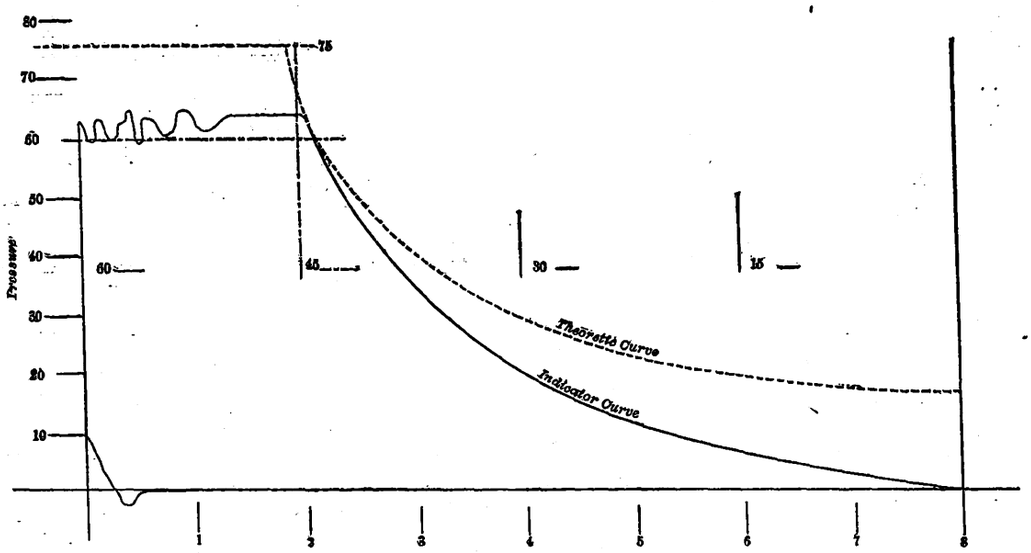
The theoretical medium is not one which can merely support particles of ore without motion, but that which can most readily be converted into the required medium of intermediate density. Air furnishes that medium, as it can be raised to the necessary resistance over 600 times per minute, while this can not be done by the water-jig for obvious reasons, notwithstanding Mr. Cazin's absurd statements to the contrary.

It has been shown, therefore, that the theories upon which the arguments have been based in support of water as the best medium are erroneous, and that the principle of a medium of intermediate specific gravity has been misunderstood to mean a medium of sufficient density to support the ore without motion; whereas the true philosophy is a medium of low density brought up to the required intermediate density by intermittent motion. This proposition is too simple to be misunderstood or questioned. It has also been shown that our present practice of jigging is not based on the principle of free fall, but on a more energetic force, and that free fall plays but an insignificant part in the separation. It has been demonstrated in practice that air can be brought up to the required density with absolute regularity, and at the rate of 500 times per minute. It is well known that the adhesion of water on fine ore particles seriously interferes with their separation, and that the absence of such adhesion in dry sands enables the pneumatic machine to treat much finer grains. It is well established in practice that less difference in specific gravity is required for the pneumatic process than for the hydraulic. It is to be regretted that my opponents have never examined the practical workings of my air-jigs, and are therefore more or less unacquainted with the principle on which they work, and entirely so with the nature of the working parts.

Let us suppose two machines working side by side—one a hydraulic, the other a pneumatic jig, both driven by the same power. We should then perceive but little difference in the operation of both machines. In each the agitation given to the ore by the upward thrust of the air or water appears substantially the same. The speed of either machine may vary within certain limits without detriment to the results, except in the produced quantity of concentrations, and both machines may be equally durable, the pneumatic machine, however, requiring less power. Again, we shall observe that the pneumatic machine can work finer grains than the hydraulic machine, and will allow a less rigid system of sizing than the latter; and lastly, water sometimes is expensive, or can not well be procured, and becomes troublesome in cold weather, while air is free from these objections. Water-dressing leaves a fine slime which is difficult and wasteful to treat. Air-jigging furnishes the same in a dry condition, which often can be used directly, but in the worst case offers no more difficulties for further treatment than the fine slimes from wet dressing. My opponents have accepted existing theories of wet concentration, and all sorts of statements in literature in favor of that system, indiscriminately and as infallible articles of faith, and they have disputed the possibility of a change or modification of these theories, and also plain matters of facts favorable to the pneumatic system of concentration.

If now, after these explanations, the gentlemen who have so violently and unjustly attacked the correctness of the theory and the practical results obtained by my air-jig still maintain their opposite views, they are invited to a competitive test to convince them of their error, and I will leave it for them to name the terms and conditions under which the test shall be conducted.

NEW YORK, November, 1882.



MESSRS. FRASER & CHALMERS, manufacturers of mining, milling, and smelting machinery, have just issued a new catalogue, fully illustrated.

THE BENNETT AIR-COMPRESSOR.

Poppet-valves for the induction of air have always been considered preferable. They have been used, however, on the self-acting principle in various forms, but always with a spring of some description to hold them to their seats, opened by the vacuum formed by the suction of the piston. By reason of the tension of the spring, this vacuum is kept up throughout a greater part of the stroke than is necessary, making so much for the piston to pull against, and never allowing the cylinder to all with free air. The recent growing demand for high speed air-compressors makes it necessary to obviate the fluttering or vibration of the spring valve at high speed. Various forms of slide-valves were resorted to, but the necessity for careful adjustment under various pressures and great loss from friction and waste in port space demanded something better. After much experience with numerous appliances, Mr. C. A. Bennett, the superintendent of the Morris County Machine and Iron Company, of Dover, N. J., has devised and perfected the automatic poppet-valve, which is the main feature of the new high-speed compressor now building by that company. It will be seen, by reference to the sectional views, that the heads of the cylinder are each provided with two poppet-valves. One set *M* is wide and freely open for the admission of air as the piston moves in the direction indicated by the arrow, and the set *M'* on the left-hand end is closed and is held tightly to the seats by means of the bar *R*, which through the rod *G*, is made to press against the cross-piece *E* connecting the valve-stems, until the beginning of the return stroke, when it moves back in the inverse direction of the arrow, and closes the valves at the other end, allowing those at the left-hand end to open at will without the use of any springs whatever. The rod *G* is attached to the cross-head of the gang-bars, which connect the steam-piston directly to the air-piston. The fly-wheel shaft is placed between them, and is in the center of the bed-plate, with steam-cylinder on one end and air-cylinder on the other, thus getting a straight line of action. The discharge-valves *N* and *N'* are of the cup form, which is found to be the most substantial. Each head contains three discharging-valves, which are held in place by a plate on the outside of the head, which is easily detached. When the air is compressed in the cylinder *A* by the piston *B* moving in the direction of the arrow, the discharge-valves at *N* open, allowing the air to pass freely down into the annular space *I I*, at the bottom of the cylinder, and out through the discharge-pipe *D* into the receiver or reservoir, the valves at *N'*, remaining closed until the return stroke of the piston opens them. Thus it will be seen that by this arrangement of induction and discharge-valves all friction (except what little is required to move the rod *R R* ⅜-inch back and forth) is dispensed with, and the air has a free passage in and out, as is shown by the card taken from one of these machines, when the compressor was doing actual work, running at a speed of 78 revolutions per minute, the throttle-valve being open and the steam pressure in the boiler at 45 pounds. No water was used in the jacket nor was any water used in the cylinder to fill waste spaces. The diameter of the cylinder was 12 inches and the stroke 18 inches.

The cylinders are kept cool by water circulating through the water-jacket *H H*. The short piece of pipe *D* collects the oil which is used to lubricate the piston, and by a simple arrangement is returned back to the cylinder. Water is injected into the cylinder in spray if desired.

THE BENNETT AIR-COMPRESSOR.

THE PROSPECTS OF THE LAKE SUPERIOR IRON MINES.

Those who saddle upon the tariff imbroglio now pending at the capital the uncertainties of the iron trade and the apparent silence which exists between ore and furnace men, do not do so, I am persuaded, from an adequate understanding of the facts. That the prolonged tinkering of our statesmen with the iron question throws some little uncertainty upon the matter of values is undeniable; but this is likely to be overestimated, even when speaking of it in modest terms. Proof of this is seen in the history of rails during the fall months of the lately deceased year. By the middle of August, when there were as yet no premonitions of the volcanic political upheaval of November, nor any pointers toward a reduction in the tariff on iron, rails had fallen off fifteen dollars per ton from the prices at which orders were booked at the beginning of the year; and by the end of September, they could be had at the mills for $43, a decline of over twenty-five per cent from January quotations. This can not be laid at the door of either tariff or political intrigue, but must be accounted for alone by the application of the economic axiom concerning the competition arising from a glutted market. Further proof of this is seen in the upward tendency of prices on rails, in spite of the tariff squabble, within the last few days, from $38.50 to $42 at mill, with prospects of an advance on that figure. In this, iron has shared in the vicissitudes common to all trades, and exemplified lately in the half-time of the coal industry and the uncomfortable falling off of clearing-house business twenty-five per cent over a like period last year. These facts shed a volume of light on the present complete stagnation and halt in communications between furnace and ore men, and it is in the light of these facts that the situation is to be properly judged.

That nothing is doing between producers and consumers is very—I almost said painfully—apparent. By the middle of this month last year, the bulk of our output for 1882 had already been spoken for and secured; but not even the best of our lake properties have as yet been inquired of to any considerable extent; and as for the second-rate mines, they are shivering in the cold with the thermometer 35 degrees below zero, and no buyer to pitch them into furnaces and warm them up. Nor do present symptoms indicate any change in the condition of affairs. The iron outlook on Lake Superior is Janus-faced, and no adequate account of the hopes and prospects of mine workers can be given that does not look both of these "faces" square in the eye. That the "hopes" and "prospects" of our producers are altogether coincident, your correspondent can find little reason to believe. The first "face"—and it is an eloquent one—is the demand which will be made on the lake for ores by furnace men at the opening of navigation. This will undoubtedly be a very small affair. The last year was one of tremendous energy in the production of ores, far eclipsing any previous year, while the consumption by no means kept pace with the supply. Probably 700,000 tons is the minimum estimate of the ore which, sold and unsold, lies unused at the docks and furnaces of Eastern towns, and it is only about two months till spring. Last year, only enough ore was on hand to carry the furnace men over until the flood-gates could be opened from our Northern beds; but this year finds enough ore on hand to carry the mills, with here and there a purchase or two, well on to September. Of course, this puts the lake men more or less in the hands—if they do not prove to be clutches—of the mill men, who will postpone inquiries for our product until along in the season, by which time, probably, many of our smaller concerns will begin to be very nervous about something with which to meet their pay-rolls. Should these concerns be forced to find ready buyers at any price, therefore, it may make the larger mines take in sail at a rate which will reduce their net earnings to a mere shaving. It is easy to see, therefore, why there are so few inquiries for ores here, and why what at first appears to be a deadlock is, after all, only a little good-natured procrastination on the part of consumers, who think to "taper off a bit" until they see how the wind is going to blow from shores along which they themselves must find markets. On the other hand, or rather on the other "face," the mine operators here are no less good-natured than their Eastern cousins. A gentleman whose opinion deserves attention informed your correspondent two days since that, during a visit in detail to all the mines of the Menominee, Ishpeming, Republic, and Michigamme districts, he had failed to find any owner who was not sanguine of a good market at good prices during the present year. The vessel-owners who supply the lake country with the Chicago traffic look forward to a larger carrying trade than ever, and are making calculations accordingly. The demand for rails during the present year, it is said, will be more than equal to that of last year, when the Bessemer and iron plants (less 200,000 tons imports) turned out an aggregate of something better than 1,950,000 tons. Without going into detail, it may, perhaps, be safely prophesied that, with no preventing disaster to crops and other farm products, the demand for rails will not fall below 2,000,000 tons. But as prices now stand, it is probable there will be little call for iron rails, and therefore rails rolled will be from Bessemer mills, the aggregate capacity of which now stands at probably 2,500,000 tons annually. At present rulings, it is not likely that many orders will be booked for English rails, so that our own brothers Jonathan will have a free and easy of the market of 1883. To be sure, this is subject to several more or less grave contingencies; but the lessons of the past year will be helpful in regulating and maintaining a steady flow of supply into a steadily maintained reservoir of demand.

Of course, your correspondent has not talked with all our mining men—from Marquette that would impossible; but he conceives that they reason on the situation about as follows: It is not at all likely that any tariff tinkering will reduce the price of rails beyond present rates; on the other hand, the tendency is already toward a strengthening of the market, and it is possible that, by the end of March, at the farthest, the price of steel rails will be at least $45 per ton. But rails sold for that or less price in immense lots during the months of August, September, and October, and no complaint was made of the prices of ores. If, therefore, the capacity of the mills is exhausted with orders at prices averaging $45 per ton, there will be no need of scaling down the prices of ores to an extent which will make mining an unprofitable industry. Actuated by all these and, perhaps, many less substantial hopes, the operators of our vast system of mines are sinking, drifting, stoping, and otherwise opening up their properties with the greatest alacrity. There is also a very large amount of prospecting quietly done, and options taken in prospect of a profitable market in the summer.

This letter has already been carried to more than modest length; but to arrive at even appropriate exactness in estimating the outlook for 1883, one other point ought to be at least casually canvassed. The contingencies of the market are much more against the ore men than were those of last year. Your correspondent does not lay claim to infallibility in saying that the demand for rails will be equal to what he has already set down, and it may be the figures somewhat exceed the maximum possible demand; be this as it may, it is not at all likely that at present prices there will be any extensive orders placed upon the books of mills which use second-class ores to any extent. What is more, there is no longer any doubt but that there is to be a reduction in hard and hematite ores of the first class, which will make second-class mining an extremely embarrassing and expensive occupation, even if they can inveigle some mill-owner into making them any offer at all for their product. Undoubtedly second-class mines are destined to stand a very hard rub in any event, with the chances against them in every market and in any condition of trade; while the glutted condition of the market and the inevitable reduction in the price of raw material make the outlook of the first-class ores, especially the hematites, any thing but a hopeful one. This may be a picture "untrue to nature;" I myself sincerely hope it will so prove; but I fear our hopes and prospects do not altogether coincide, and to base operations on mere hope would be to reckon without our host. Such, Mr. Editor, is the explanation of the apparent but not real dead-lock between lake producers and Eastern consumers. Each party is willing to wait, the mill-owner in the hope of getting the miner on the hip, and the miner in hope of a convalescence in prices which will bring a year approximating in activity, if not quite in remunerativeness, those of the boom period.

SPECULAR.

MARQUETTE, Feb. 2.

THE COST OF MANUFACTURING SULPHURIC ACID FROM PYRITES.

The following is an estimate made by William G. Crenshaw, President of the Atlantic & Virginia Fertilizing Company, and Vice-President of the Sulphur Mines Company, of Virginia, on the comparative cost of manufacturing sulphuric acid from brimstone and from pyrites, based on one year's working of a set of chambers with 110,000 cubic feet condensing capacity:

FROM BRIMSTONE.	
Cost of plant	$30,000
1100 tons seconds, $31.50	$34,650
88 tons nitrate, $55	4,840
Labor	1,200
Coal	1,200
	$41,890
Interest, repairs, wear and tear, and superintendence, 20 per cent	6,000
	$47,890
Yield, 4950 tons chamber acid, if sold at $11 per ton	$54,450
Profit (say 13·69 per cent on annual expenditure)	$6,560
If sold at $10 per ton	$49,500
Profit (or 3⅓ per cent on expenditure)	$1,610
If sold at $9 per ton	$44,550
Loss	$3,340

Cost of chamber acid, $9.71 per ton of 2000 pounds.

FROM PYRITES.	
Cost of plant	$32,000
2100 tons at $6	$12,600
80 tons nitrate, $55	4,400
Labor	1,200
Coal	1,600
	$19,800
Interest, repairs, wear and tear, and superintendence, 20 per cent	6,400
	$26,200
Yield, 4050 tons chamber acid, if sold at $11 per ton	$44,550
Profit (say 70 per cent on expenditure)	$18,350
If sold at $10	$40,500
Profit (or 54 per cent on expenditure)	$14,300
If sold at $9 per ton	$36,450
Profit (or 39 per cent on expenditure)	$10,250

Cost of chamber acid, $6.47 per ton of 2000 pounds.

PROGRESS IN SCIENCE AND THE ART.

A New Method of Insulating Wire.—Preparations have been recently completed by a new concern in this city, the Triplex Insulated Wire and Rubber Company, to manufacture insulated wire for underground and other telegraph, telephone, and other conductors. Samples which we have carefully examined prove that the system employed avoids the serious drawbacks justly raised against some of the insulating devices now in use, and gives promise of obtaining a wide field of usefulness. Briefly, the principal troubles experienced in connection with the most popular methods have been that the insulating material becomes too brittle in cold weather, making it liable to flake off, and too soft in hot days. Some kinds also do not adhere to the wire, and may be stripped from it easily. The Triplex Company tins the wire, covers it with a layer of soft rubber, around which a strip of soaked linen is wrapped, and which in turn is covered by an outer layer of thick hard rubber. For underground wires, another layer is added. The process of manufacture of this insulated wire is very simple, all the layers being put on in one operation by means of machinery, thus making it possible to furnish a comparatively cheap article. The wire is fed from a reel into a groove cut upon two steel rollers heated with steam, and simultaneously two strips of soft rubber, each more than covering one half of the wire. The excess of rubber is stripped. The coated wire is then automatically wrapped with soaked linen strips, and is carried to a second set of rolls, where two strips of hard rubber are united around it to a third coating. In this the central position of the wire in the insulating material is always secured, a matter in which other methods are not so successful.

"Steel-Iron."—The question of producing a metal possessing the physical properties of both iron and steel has for some time past received attention at the hands of practical metallurgists and others. One of the latest workers in this direction is Prof. M. Keil, who has succeeded in producing a compound metal which is stated to possess the characteristics of both metals. The professor, in giving his experiences on the subject, states that the difficulties can only be obviated when the two materials are intimately united into a whole. After many experiments, success

Digitized by Google

has, it is claimed, at last attended them, and a material has been produced answering every requirement, and to which the name of "steel-iron" has been given. The following five descriptions have been made: (1) steel by the side of iron; (2) steel between two layers of iron; (3) iron between two layers of steel; (4) the core of steel, the surrounding shell of iron; (5) the core of iron, the surrounding shell of steel. This steel-iron is manufactured in the following manner: A cast-iron mold is divided into two parts by a thin sheet of iron securely fixed in it. The fluid steel, as well as the fluid wrought-iron, which have been freed before smelting from substances preventing welding, are poured at the same time, and in the same quantity, into this double mold; the separating plate serving as the medium welding both parts, steel and iron, completely together, so that they form an inseparable whole. The plate serves as a separator and a welding agent at the same time. The success of the operation depends upon the quality and the thickness of the plate. The latter must be of a certain thickness, to prevent the two glowing and liquid masses burning through it; and it must not be too thick, so that they are able to bring it up to welding-point while rising in the mold. The dimensions of the plates depend upon experience, and naturally are regulated by the dimensions of the castings. The manufacture of the above-mentioned five kinds is the same in principle. In Nos. 2 and 3, however, the mold is divided into three equal parts, by two strips of plate; in Nos. 4 and 5, the core is formed by a sheet-iron pipe standing in the middle of the mold. It is stated by Professor Keil that the product thus obtained may be used for a great many purposes. Steel upon iron will be useful for rails, armor-plates, and anvils, the hard steel face reducing wear and tear, and also, as in the case of thief-proof safes and armor-plates, withstanding the attacks of even the hardest drill, while the iron prevents cracking consequent upon heavy blows. Parts of machinery and tools which are subject to powerful pressure, and are exposed at the same time to great vibration, are best made of the material with tough core and hard surface. The wear and tear would be slight, while the soft core imparts considerable strength and prevents fractures. From what has been said respecting the quality of this description of steel-iron, it will be seen that the extent of its application promises to be a wide one, partly on account of its undoubted excellence, partly also, from its many qualities, because it may be used for a great variety of manufactures.

WE are informed that Mr. Marsden, of the Farrell Ferro-Dynamic Foundry and Machine Company, of Ansonia, Conn., has challenged the Gates Iron-Works, of Chicago, which manufactures the Gates crusher. Mr. P. W. Gates has accepted the challenge for a trial to take place within sixty days, in the neighborhood of New York, for the purpose of testing which of the two rival machines is superior to the other.

IN a recent issue, the *Railway Age*, of Chicago, published in full the rules and regulations of the National Exposition of Railway Appliances to be opened in that city on the 24th of May. There is a very long list of premiums to be granted to the exhibitors of the best appliances. There are eight gold medals for locomotives, including one for logging and mining, a large number for cars, for axles, springs, tires, trucks, rubber and leather hose, wood-working and iron-working machinery, including drilling, planing, punching, forging, testing, grinding, and tapping machinery. Medals are to be awarded for rails and track tools, metals, scales, office and station appurtenances, oils, varnishes and paints, electric lights, castings, pipes, forges, wire rope, surveyors and draftsmen's instruments, rock-drills, etc.

A STRIKE IN AN ENGLISH ZINC MINE.—A remarkable find of blende at the Magpie mine, Derbyshire, is exciting great interest in mining circles in England. The mine is near Bakewell, in High Peak, and has been worked for three hundred or four hundred years, with the exception of a short interval from 1843 to 1869. In the latter year, it was again opened out, but the proprietors had a prolonged struggle against water, the great enemy of lead mining in North Derbyshire. For nearly two years, pumping was carried on at an expenditure of 80 tons of coal per week. During this period, the owners raised £19,000 worth of ore, at a considerable profit; but in consequence of the great expenditure of coal, it was thought advisable to suspend pumping, and to get rid of the water by driving a level. This work was begun in 1873, and was finished in 1881, at a cost of £14,000, the level, nearly 2000 yards long, unwatering the mine to a depth of 196 yards. A few weeks ago, Mr. Simmons, the captain of the mine, made the discovery of a seam of blende five feet wide, which increases in width the farther it is explored. Mr. Simmons regards the discovery as most wonderful and altogether unparalleled in England. He estimates that there are at least 50,000 tons of ore in the seam, worth £3 18s. 6d. per ton. The company is now making a road to its rich deposit, and laying down a four-foot track, on which the ore will be conveyed out of the workings. Twenty yards from this find of ore, the workmen came upon an immense natural cavern, twenty-two yards long, extending for twelve yards overhead and for an unknown depth below water. This cavern was sufficiently large to hold the whole of the *débris* excavated during six months, and was of great convenience to the company.

FURNACE, MILL, AND FACTORY.

The Steele Ore Company of Pottstown, Pa., which is composed of Messrs. Gabel, Jones & Gabel, has leased the furnace at Bechtelsville, Berks County, Pa., and changed its name to Norway Furnace. Mr. Griffith Jones, the superintendent, informs the editor of the *Bulletin* that the furnace was blown in on the 5th of January, and has been doing very well ever since.

The Morris County Machine and Iron Company, at Dover, N. J., is making several sizes of its new Bennett compressors, and proposes to make two sizes in duplex form. It has recently enlarged its works to meet the demand.

Messrs. R. D. Wood & Sons' foundry, at Millville, N. J., has resumed operations after a prolonged idleness.

The Edgemoor Iron Company, of Wilmington, Del., has completed its contract for furnishing material for the superstructure of the Brooklyn bridge, and has fully closed the transaction.

The Andrew Kloman Iron and Steel Company, at Pittsburg, is reported financially involved. The liabilities are said to be $65,000, of which $43,000 is secured.

The rolling-mill of the Reading Iron-Works, and Orr, Painter & Co.'s stove-works, at Reading, Pa., employing together nearly 600 hands, have resumed operations after six weeks' idleness.

The Bessemer Iron Company, of Avonia, capital $60,000, was incorporated at Albany on the 5th inst.

The second stack of the Dunbar Furnace Company has been blown out. The first one, now repairing, will blow in in two weeks. The company has notified its men that hereafter a certain percentage will be retained from their wages every month for three months, payments in full to be made every quarter. The company is carrying a heavy stock of pig.

Reis Brothers' sheet-mill, at New Castle, Ohio, which has been idle for some time, has started again.

At the new rolling-mill of James Ward & Co., at New Philadelphia, Ohio, it is expected that ten of the puddling-furnaces will be in operation by the middle of February, and the entire mill running by the 1st of March. The mill will furnish employment to 300 men.

New foundations are laying for the recently destroyed plant of the Chicago Smelting and Refining Company. The buildings will be 120×220, with blast-furnace building 60×60. Some new machinery will be added, and it is expected that the works will be ready to receive and refine base bullion by May 1st.

The work of rebuilding the nail mill of the Calumet Iron and Steel Company, which was burned recently, has been commenced and is pushed energetically. It is expected that the new mill will be in running order in about three months. It will cost $200,000, and will, it is asserted, be the largest and most complete nail mill in the country.

Gem Furnace, of the Shenandoah Iron, Lumber, Mining, and Manufacturing Company, at Milnes, Va., was blown in recently.

The Lucinda Furnace, at Norristown, Pa., has gone out of blast.

Copper smelting-works will very probably be erected in Harrisburg by W. H. Babbitt, of Boston. He has been engaged in locating sites, and it is said has fixed upon one as very likely to be selected—the building of the Lochiel Iron Company.

The forge department of the Belfont mill, Ironton, Ohio, has resumed work. The nail department is expected to go on Monday, the 12th inst.

The new 70-foot furnace of the Bethlehem Iron Company, at Bethlehem, Pa., has been blown in.

The Kansas Rolling-Mills, at Rosedale, Kansas, closely allied with the Union Iron and Steel Company, of Chicago, were closed on the 3d inst.

At a meeting of citizens of Coshocton, O., held to take action on rebuilding the steel-works recently destroyed by fire there, it was decided to vote a special tax of $50,000, of which sum $15,000 will be donated to the steel-works, and the remainder to other industries which may locate there.

The receivership of the Oxford Iron Company, Oxford, N. J., is ended, and the works are run by a new organization, the Oxford Iron and Nail Company, of which Mr. Theodore Sturges is president.

The work of re-lining one of the Henry Clay furnaces, of Eckert Brothers, Reading, has been completed, and the furnace will be put in operation as soon as possible. The stack has been raised from 45 to 57 feet. As soon as this stack is blown in, the other will be overhauled.

The following figures regarding a recent month's work at the rod-mill of the Cleveland Rolling-Mill Company are valuable and interesting: In 48 single turns of 9 hours each, 3,844,500 pounds, or 1716·8 gross tons, of rods were produced. The five largest amounts turned out in a single day were 100,015, 95,090, 94,200, 90,675, and 88,370 pounds. The smallest day's work was 66,750 pounds. The average was 80,093 pounds. The rods were No. 4, rolled directly in one heat from a four-inch square 100-pound bloom.

The Virginias reports that each of the sixteen furnaces in Southwest Virginia was in blast more or less during the year 1882, and that they made between 19,000 and 20,000 tons of charcoal pig (probably most of it car-wheel grade), and that about 7000 tons of this output was in hand at the close of the year. The average daily capacity of all these furnaces was about 100 tons. It seems that about half of them will be idle this year unless the price of iron improves.

The Curtis Regular Company, of Boston, reports doing a good business in steam traps and regulators, having recently supplied the Freeman Manufacturing Company and the Massachusetts Mills. They are sending large numbers to New York and Chicago.

The floods in Pennsylvania and Ohio have caused the temporary suspension of work in a number of mills, and by the interruption of railroad traffic will be hampered for some time to come. The direct damage, so far as now reported, is not very great.

The Western Nail Association met at Pittsburg on the 8th inst., and passed a resolution to the effect that, after the resumption on the 12th, the mills in the association will run three weeks only, and then shut down again for a fortnight. The thirty days' suspension expires on the 9th. Stocks are reported very light, and inquiries are multiplying as the building season approaches. No change was made in the existing card rates.

GENERAL MINING NEWS.

ARIZONA.

Dispatches from Lordsburg, New Mexico, indicate that there is trouble brewing with the Indians. Clifton appears to be threatened, and the whole Gila Valley is alarmed.

COCHISE COUNTY.

DREADNOUGHT.—This copper mine, adjoining the Peabody, has been sold to the owners of the Clifton mines for $10,000 cash.

TOMBSTONE DISTRICT.

GIRARD AND TRANQUILLITY.—Work will be resumed at these mines next week.

HEAD CENTER.—Work will be begun shortly. At the annual meeting, held in San Francisco recently, the following trustees were elected: F. A. Benjamin, A. W. Foster, P. N. Lilienthal, J. L. Moody, J. M. Gitchell, M. L. McDonald, and J. W. Pew. The officers will be elected soon. The action of the board of trustees in disposing of the property to a new corporation was ratified.

CALIFORNIA.

MILTON MINING AND WATER COMPANY.—The financial statement for the year 1882 shows the following:

Receipts.		
Gold bullion	$416,044.17	
Water sales	1,425.66	
Personalty reduced	11,759.05	
Total receipts		$429,228.88
Disbursements.		
Bonds redeemed (fifty)	50,000.00	
Interest on bonds	12,818.80	
Improvements on other property	12,908.07	
Expenses of mining	236,592.53	
Dividends	88,424.00	
Total disbursements		400,743
Increase in cash assets		$28

Showing net profit in working the Milton mines of $180,877.30.

Digitized by Google

NORTH BLOOMFIELD MINING AND WATER COMPANY.—The financial statement for the year 1882 shows the following:

Receipts.		
Gold bullion	$386,146.23	
Water sales	2,899.12	
Dividends from branch companies	42,885.50	
Personalty reduced	4,069.80	
Total receipts		$436,000.65
Disbursements.		
Bonds redeemed, 106	106,000.00	
Interest on bonds	37,075.49	
Expenses of mining	153,714.03	
Dividends	135,000.00	
Total disbursements		431,789.52
Increase in cash assets		$4,211.13

Showing net profit in working the North Bloomfield mine proper of $285,331.32.

As these properties, says the San Francisco *Chronicle*, are among the leading hydraulic gravel mines in the State, the following tabular statement showing their operations for the past six years will be of interest:

	Bullion produced.	Water sales.	Net profits.	Dividends.
1877	$670,774	$6,754	$364,045	$45,000
1878	849,036	9,694	501,181	484,498
1879	794,518	9,091	462,321	422,640
1880	665,711	12,395	264,075	105,396
1881	637,682	24,233	325,227	...
1882	802,190	4,325	416,209	223,224
Totals	$4,419,911	$66,492	$2,333,558	$1,290,758

These mines were closed by injunctions for four months during the year 1881, which accounts for the small product of that year. At the beginning of 1877, the two companies were in debt over $1,000,000. Since then, this debt has been reduced to $344,000. These payments and interest on this indebtedness chiefly account for the above discrepancy between profits and dividends.

MONO COUNTY—BODIE DISTRICT.

NOONDAY, NORTH NOONDAY, AND RED CLOUD.—The statements of these companies, which recently filed petitions of insolvency, show that they have all been in a bad condition financially. The Noonday Mining Company's liabilities are placed at $204,209.44, $179,258.01 of which consists of a judgment lien from the Superior Court in favor of Henry Wadsworth. The remainder is due to laborers, railroad companies for transportation, etc. The assets are placed at $10,100, consisting of lands, leads, tools, milling property, etc., in Mono County. The North Noonday Mining Company's liabilities are placed at $238,989.93, including a judgment held by Henry Wadsworth for $214,985.85. The assets are stated to be $10,900, consisting of similar property to that held by the Noonday Mining Company. The liabilities of the Red Cloud Mining Company are set down at $168,157.10, including a judgment lien in favor of Henry Wadsworth for $133,786.88 and a claim of the Bodie & Benton Railroad and Commercial Company for $25,859.82, acknowledged to be for transportation of ores, etc. The assets are stated to be $115,854.12, consisting of tools, sluices, land, etc., to the value of $45,000; the Paris Mining Company's property, valued at $28,280.25; the property of the May Belle Consolidated Mining Company, valued at $29,824.29; the Concordia Mining Company's property, valued at $33,824.25; and the property of the Oro Mining Company, valued at $18,925.29.

PLUMAS COUNTY—GREENVILLE DISTRICT.

The Greenville-*Bulletin* gives the following:

GREEN MOUNTAIN.—The new air-compressor has been started up. The machine works perfectly in all its parts; the drills bore four feet per hour, though the ground is hard. During the past week or two, a very marked improvement is seen in the character of the rock, with a corresponding increase in the yield of bullion at the mills.

TAYLOR-PLUMAS.—The mill works smoothly, and the mine is daily improving.

CANADA.

PROVINCE OF MANITOBA.

GEORGE HEENAN.—This company was recently formed in Winnipeg. The *Free Press* says that the promoters have purchased the claim on the Lake of the Woods known as the Thompson lode, situated on Hay Island, about a mile from the Keewatin vein. Specimens of the quartz taken from the lead have assayed as high as a thousand dollars to the ton. The company will be organized under a special act of the Manitoba Legislature. The price paid for the claim is $150,000.

KEEWATIN.—Work is pushed with great vigor.

LAKE OF THE WOODS.—It is stated that this company has on its property one of the strongest fissure-veins on the lake, over eight feet in width, and rich in both gold and silver. It is not expected, however, that much more than desultory work will be done on this until spring, as the company wishes to make thorough and careful surface prospecting over the whole of its large property, before finally determining upon the location of the working-shafts.

WINNIPEG CONSOLIDATED.—The shaft has attained a depth of 55 feet.

COLORADO.

CLEAR CREEK COUNTY.

HARRIS & BONN.—This group of mines was recently sold to the Mint Mining Company. The property consists of six lodes and mill-sites, known as Mint, Mint Extension East, Mint Extension West, Tornado, Coachwhip, and Pocahontas lodes. The principal development has been on the Coachwhip and the Mint. The latter shows ore for 150 feet on surface, which mill-runs over 150 ounces silver per ton, with a pay-streak of from two inches to two feet in width. It has a shaft 100 feet deep, and an adit is running to cut this shaft seventy feet beneath the present workings. This work is done by contractors. A large force of men will be put on as soon as the weather permits. The capital stock of the company is $175,000, with 3500 shares at fifty dollars per share.

GILPIN COUNTY.

POLAR STAR.—This mine, situated on Negro Hill, has been sold to Eastern capitalists for the sum of $6000 cash. It is the intention of the purchasers to continue work on the mine and sink the working-shaft another lift of 100 feet, which will give it a depth of over 200 feet.

HINSDALE COUNTY.

EXCELSIOR.—The shaft is down on the vein about 68 feet. Sinking will be continued until 70 feet is gained, when drifting on the vein will be commenced. The mineral is gray copper and a small percentage of zinc, and is now and then interspersed with brittle silver.

MORNING STAR.—The character of the ore now exposed is a dark, sulphureted rock, and carries galena and gray and yellow copper.

LAKE COUNTY.

Late Leadville exchanges contain the following:

AMIE.—The lessees state that out of nine drifts in their workings, eight show ore, and that there is as much ore in sight as they can possibly extract within the next thirty days. The company receives, it is said, about thirty-three per cent. gross yield of the mine.

BIG PITTSBURG.—Mr. Frank Bulkley, late of the Morning and Evening Star mines, has been appointed manager of the Big Pittsburg consolidation.

HENRIETT.—Development-work is making rapid progress, and the resources of the mine and facilities for extracting the ore are increasing daily. The No. 3 or center shaft has formed a connection with the main incline from the Harker shaft. Recently a good hoisting plant was placed on this shaft. The incline is advancing on the ore-body in the Henriett at the rate of two feet a day, and is disclosing some very high-grade mineral. The shipments of the mine average forty tons a day.

LADY ALICE.—A twelve-inch streak of ore, assaying from six to seventeen ounces of gold to the ton, has been struck. Two hundred sacks of ore are at the mine awaiting shipment.

LEADVILLE CONSOLIDATED.—This property is maintaining its output of twelve tons a day. During the past few weeks, cross-cuts and leads have been extended, until now connections exist between all three of the inclines on the mines. Extensive ore-bodies have been opened in the third level north, and also in a large piece of ground between the tenth and eleventh levels south.

PLATTSBURG-JUNIOR.—During the past winter, considerable work was done on both the Plattsburg and Junior veins. Two shifts of miners are now engaged in sinking a shaft on the Junior vein, beginning on the floor of the Junior tunnel, about one hundred feet from the entrance. The shaft has attained a depth of about twenty feet, following the hanging-wall. The vein at this point has a width of about fifteen feet of solid quartz, carrying free gold, plainly visible to the naked eye. About two feet of this quartz has been shown by assays to run unusually well in gold, returning far above the average of Lake County gold veins. Arrangements are to be made for the erection of a twenty-stamp mill.

ROBERT E. LEE.—There is enough third-class ore stacked up on the dumps to warrant the building of a stamp-mill for its treatment. On the basis of prices charged for milling this class of ore, the eight thousand tons now on the dump, together with what will be taken out in the next few months, would yield a profit that would repay the original cost of a fifteen or twenty-stamp mill, complete with pans, etc.

ROSEVILLE-ALTA.—Owing to the great flow of water in the Roseville shaft on Prospect Mountain, the company has been at a stand-still for some weeks past. It has not yet been decided whether increased pumping machinery will be provided, or a tunnel driven in from the foot of the mountain, about one thousand feet distant from the shaft.

LA PLATA COUNTY.

PUZZLE.—It is reported that this company intends to erect extensive machinery with which to operate the mine next season. So far, the returns from the workings have been very satisfactory.

SAN JUAN COUNTY.

During January, there were shipped from Silverton over the Denver & Rio Grande Railroad 76 cars of silver ore and 19 cars iron ore.

SUMMIT COUNTY.

ROBINSON CONSOLIDATED.—The Leadville *Herald* of February 2d says: On Thursday evening, Judge Goddard, in the suit of William R. Hall, J. B. Stevens, and L. B. Parker *vs.* the Robinson Consolidated Mining Company, granted the application for a receiver on the part of the plaintiffs, and appointed Mr. J. W. Wallace receiver of the property. The complaint on which the application was granted alleges, on the affidavit of L. B. Parker, late manager of the mine, that Hall is the owner of 200 shares of the stock, Stevens of 1000 shares, and Parker of 500; that the mine could be made to pay $15,000 per month above all expenses; but that during Parker's management he had not been allowed to work it either extensively or advantageously, and, notwithstanding such restraint, there were $43,000 in bank to the credit of the mine on June 1st, 1882, and $20,000 had been added since, besides the payment of $5000 of previously accumulated debt; that on the first of January, 1883, there were but $33,000 in the company's treasury, leaving $30,000 to be accounted for by the New York offices; that the workings of the mine, which are fully described, are very extensive and have cost the company about $750,000; that they were left in fine order by Parker, but that his successor, J. W. Davis, is allowing them to be flooded and damaged by water, and threatens to abandon them; that unless the pumps are kept working, all the drifts below the fifth or tunnel level will fill with water and cause irreparable damage; that a dividend was declared, to be paid on November 1st, 1882, and the amount of money required was forwarded by Parker for that purpose, but was fraudulently and wrongfully withheld by the president and directors, and squandered by them; that on April 1st, 1882, the President, Hiram A. Johnson, of New York, drew from the First National Bank of Denver $35,000 of the funds of the company, and placed it in the hands of Wilson Waddingham, a broker of New York, for the purpose of speculation, and that said funds were either lost or misappropriated; that all of said acts, together with the reports lately circulated in various newspapers as to Parker's having abstracted $200,000 worth of ore through the Wheel of Fortune, and other false statements, are a part of a conspiracy between Johnson, the directors, Waddingham, and other speculators to bear the stock of the mine and buy it in at a nominal sum; that such procedure is detrimental to the stockholders; and none of the said officers or directors is financially responsible; for all of which a receiver was asked.

DAKOTA.

ESMERALDA.—A dispatch from Deadwood says that a cave in the main workings of this mine almost instantly killed three miners, who, while returning from the scene of danger, were hurled through the tunnel by the air compressed by the cave-in, and thrown with deadly force upon the rock. Work in the mine and mill was not interfered with.

FATHER DE SMET.—The superintendent writes, under date of January 17th, as follows: Herewith express company's receipt for bar No. 151, for 1329·70 ounces gold, the result of a run of mill for first half of January. We have made a good start for this year, and intend to keep it up for a time at least. On the 15th inst., I drew for $19,000, which amount covers all expenses incurred for December. The mill is doing excellent work, stopping only to clean up. The body of ore spoken of last summer, as being in Golden Gate cross-cut 2d level, is proving very extensive, as we have excavated a chamber 40 feet wide by 70 feet long, with ore at both ends of chamber. From this chamber, I am sinking a winze to the 3d level, while the 3d level header has to be advanced 75 feet, to intercept the bottom of the winze. From appearances in this header, we are very likely to strike a good body of ore. The 3d level is the lowest point in the mine from which ore has been extracted, and is the level from which we load the cars that run to mill.

GOLDEN SUMMIT.—The mill is about ready to start. The quantity of water that is now conducted from the springs a couple of thousand feet distant is much greater than the company hoped to receive. It is sufficient to supply from sixty to eighty stamps at the present dry season of the year. A large quantity of ore is already on the dump.

GUSTIN BELT.—Negotiations are pending for the sale of the Minerva mine to this company. The sum that has been agreed upon is $40,000. Of this amount, $5000 have already been paid. The remaining $35,000 are to be put up within thirty days, when the Minerva property will pass into the possession of the Gustin Belt Company.

HOMESTAKE.—The last bullion shipment, including the semi-monthly clean-up, has been snowed in at Pierre, with no prospect of getting through for several days. About $200,000 exchange was also caught in the blockade. The only route now open to the hills, or likely to be for some time, is via Sidney, Neb. All the mails, express matter, and passengers are now forwarded by that route.

GEORGIA.

The Dahlonega *Signal* has the following:

BARLOW.—The formation of this mine, where the giants are now at work, is softer if possible than any of the ground that has yet been mined. The slate

Digitized by Google

melts before the water like ashes, leaving the quartz clean, and before reaching the mill it is worn as smooth as river pebbles by the water as it rushes through three quarters of a mile of flume-line. All the stamps are running.

CONSOLIDATED GOLD MINING COMPANY.—The mills are under headway and the cuts show large amounts of pay-ore. The ditch to convey water to the Ivey is about finished, the water being in and making its way toward the mine.

PIGEON ROOST.—The recent valuable veins discovered are not yet mined, as it is first necessary to remove a considerable amount of rubbish and low-grade ores.

IDAHO.

EAST FORK MINES.—Advices from the East Fork of the Salmon River report another important strike in that section. The miners running the main working tunnel to cut the Chloride vein, cut into a blind ledge carrying carbonate and galena ores, and samples of the ore sent here for assay run up into the hundreds. The Chloride tunnel is now in 110 feet, and is expected to cut the vein by February 15th. The result is anxiously awaited by owners of adjacent locations.

PENOBSCOT.—The main lower tunnel on this mine, running to cut the vein, is now into the hill a distance of 200 feet. After reaching a distance of 80 feet, the ledge was cut into, and to the present time the tunnel has been crossing vein-matter, and has not yet reached the hanging-wall. This 120 feet of vein-matter which has been passed through so far is mixed with gangue, spar, iron, carbonate, and galena. The ledge is apparently solid on the hanging-wall, and work will be pushed with all dispatch until the other wall is reached.

MAINE.

DOUGLASS.—Operations at the mine continue in a satisfactory manner.

PORTLAND SMELTING-WORKS.—From a letter written to the Maine *Mining Journal*, we learn that these works are to be started again under lease to Messrs. Jones & Davis, who recently built experimental works at Deer Isle, to work the vapor fuel process. They are said to have also secured the Fisher process of working refractory sulphuret ores, which, it is asserted, far outstrips the celebrated Swansea process.

STEWART.—The machinery is nearly all completed, and underground work will be begun shortly.

SULLIVAN.—The Waukeag shaft is sinking as rapidly as possible. It is expected that considerable work of a more comprehensive character will be done at this mine in the spring.

MICHIGAN.

Mr. Collyer, of the firm of Wilson & Collyer, of Chicago, which is a creditor to the amount of $30,000 of the Union Iron and Steel Company, was at Ford River, Mich., when he heard of the failure. He immediately went to Marquette, procured a writ, and chartering a special train, proceeded to Crystal Falls, where he attached the mine and other property of the company, thus getting ahead of the other creditors.

MONTANA.

LEXINGTON.—At the meeting of the company, held in Paris, France, on the 5th of January, it was shown that during the first four months of the working of the mill, it treated 11,800 tons of ore at a gross profit of 647,000 francs, or 56 francs per ton.

NEVADA.

ELKO COUNTY—TUSCARORA DISTRICT.

NAVAJO.—The superintendent reports, for the week ended January 22d, that work on the 450 level was discontinued, to admit of the necessary work being done at the station before sinking could be resumed. Good progress has been made in cutting out for the water-tank, and all other work is pushed ahead rapidly. Winze No. 2 was sunk seven feet, showing an unusual width of very rich ore. Stopes on the different levels are without material change. South drift, east lateral vein, 350 level, advanced fourteen feet. No material change to note. As we shall have to close down the mill for a few days this week, to make some repairs and clean out the boiler, our bullion shipment will not be so large next week. The run has extended over fifty days without stopping.

EUREKA COUNTY.

HAMBURG.—The Eureka *Sentinel* says that a new strike has been made. The strike is in a shaft down 175 feet from the surface, situated about 75 or 100 feet west of the cañon. The mine was worked successfully for a long time by prospectors who took out ore from near the surface, realizing large amounts of money. Since it has been in the hands of the present company, the ore extracted has yielded about $370,000. There is a good plant of machinery on the main shaft of the mine, and every convenience at hand for the economical working of it. The main shaft is down 860 feet, and several drifts have been run from it through the limestone, with ore in places and good indications to follow.

NYE COUNTY.

TYBO CONSOLIDATED.—Mr. N. S. Trowbridge, the manager of this property, has furnished the Salt Lake *Tribune* with the following information: The ores of this company's mine are base, containing gold, silver, and lead, and in the process of reduction require roasting. The property is located in an expensive place to operate, because all supplies have to be hauled long distances at a cost for some articles of six cents per pound freight. Salt used in chlorinization is about the cheapest article of supplies, and costs delivered at the mill $60 per ton. The mine is a large one, and could not be operated at a profit if the manager had not secured remarkably good results and low cost of reduction for the locality. The lead is not saved, and its presence in the ore to a large percentage makes the cost of reduction larger than it would otherwise be. The mill has twenty stamps, and is similar to other silver and gold mills. The following is a *résumé* of the work done during the past season:

Total running time by mill	137 days.
Total amount of ore worked	3776·2 tons.
Deduct loss of dust, etc., 2 per cent	75·2 tons.
Actual number of tons worked	3701
Average tons worked per day	27·57
Average value per ton in silver	23 ounces.
Average value per ton in gold	$4
Average amalgamation, silver	89·5 per cent.
Average amalgamation, gold	$2.50 per ton.
Average cost of mining and chloridizing	8.75 "
Average cost of milling	16.65 "
Net proceeds per ton	24.36 "
Net profits per ton	4.96 "

Many good prospects lie idle because of the excessive cost required to operate mines in that locality.

WHITE PINE COUNTY—CHERRY CREEK MINING DISTRICT.

A correspondent of the Salt Lake *Tribune*, in speaking of the mines, says: Enough work has been done in this district to confirm the opinions formed by the pioneers, many of whom remain with it, with the full assurance that sooner or later their fondest anticipations will be realized. Among the most prominent mines is Exchequer or Exchange, now the property of a Boston company. Large bodies of ore are now developing above water-level by Cornish tributers. This mine is without a doubt good property, but it should have a proper expenditure of capital to erect machinery properly to develop it.

The Star mine is by far the best developed in the camp. A twenty-stamp mill has been constantly at work, though at a small loss. This mine has only attained the depth of a little over 600 feet; yet in spite of insufficient machinery, a twenty-stamp mill has run constantly over five years, and now has very many thousand tons of low-grade ore on the dumps, which the company will utilize by the aid of concentrators recently erected, and the prospects in the mine are now better than they have been; but in order to be worked at a profit, it needs more powerful machinery.

The Gray Eagle is situated immediately adjoining the Star on the west, and the developments made in the levels of the latter demonstrate the continuity of the ore-bodies to the former, having worked to the Gray Eagle boundary in three or four levels.

NEW MEXICO.

Contracts are making for the survey and construction of the road from El Paso to White Oaks.

The United States & Mexico Syndicate has purchased and is opening several mines on the lead of the Little Buck and Merrimack, in the Organs, and is reported to be arranging for putting up a smelter and other machinery.

UTAH.

A correspondent of the Salt Lake *Tribune*, in speaking of the Carbonate Mining District, says:

The most prominent of the mines here now, and around which there is much interest, is the Copper King, which is a large mine, bearing copper ore of unusual richness and fineness. The lead proper just unearthed shows now about four feet of the richest kind of ore; how much wider, is not yet known, but at present only one wall has been found. The lead works easily, the copper ore coming out in big chunks, which is intermixed with beautiful yellow sand carbonates. The mine is situated near the top of one of the high mountains, and is between a contact of beautiful white quartzite and blue lime. A short distance below is a fine layer of hematite of iron, and still lower in the contact of the old red sandstone, showing very clearly that this bed at least lies near the bottom of this gigantic formation of lime. Immediately above the mine, towers a high cliff of limestone, quartzite, flints, and various other strata incidental to this per There is now about a car-load of rich ore on the dump awaiting spring for s nment. Besides the copper, the ore runs about twenty ounces silver, and a t of gold, with a strong marked improvement in the silver assays as dept attained.

The Amazon exhibits some strong croppings of copper and galena ores, and is down about eighteen feet.

Most of the claims taken up here some three years ago, during an influx of Colorado prospectors, are now open to relocation.

The Union Consolidated Mining Company is interested in some claims.

MINGO.—According to the Salt Lake *Tribune*, the smelter began operations January 1st, 1877, since which it has run most of the time, and yet at one time it lay idle for four months. Its product of lead bullion has been steady, and has reached an enormous aggregate. Recently it completed its shipment of 2000 cars, which were sent East. The average was a little over thirteen tons to the car, making an aggregate of over 26,000 tons. Most of the ore is brought to the smelter by rail, and all the fuel and fluxes are delivered to the works by the car-load, and it is estimated that it required nearly 10,000 car-loads of ore, iron, limestone, charcoal, coke, coal, etc., to produce this vast pile of bullion.

WYOMING.

Late reports from Cummins City are of a very encouraging nature. The new stamp-mill, formerly at the Florence mine, Douglas Creek District, is in full blast on Union Mining Company ore—mostly from the Gold Hill. Some trouble was experienced at first, owing to the cold weather; but steam-pipes have been put in, and it is evident that the first clean-up will be a good one. This mill runs ten stamps.

Messrs. Burnham & Hudson's mill is also making full time. These gentlemen say they are getting $40 per ton from their ore, but that Denver mill-runs give them $100. They are making arrangements for putting in fifteen more stamps. They are running ore from the Gold Blossom. These gentlemen will also put in a smaller smelter at an early day, to reduce the product of the Silver Mountain, a very promising mine with a six-foot vein, carrying gray copper and copper glance.

MINERAL PATENTS GRANTED BY THE UNITED STATES LAND-OFFICE.

The following mineral patents have been issued from the General Land-Office, under date of January 15th, 1888:

ARIZONA.

PRESCOTT DISTRICT.

Noah C. Shekels, Ophir lode.

TUCSON DISTRICT.

Sunset Silver Mining Company, Sunset lode.

CALIFORNIA.

LOS ANGELES DISTRICT.

Robert Gardner, Gardner lode.

MARYSVILLE DISTRICT.

William Hooper, placer.

SACRAMENTO DISTRICT.

J. L. Lewison, U. S. Grant mine No. 1. J. M. Green, Currie quartz mine. Michael Soap, placer.

STOCKTON DISTRICT.

PATENTS GRANTED BY THE UNITED STATES PATENT-OFFICE.

GRANTED JANUARY 2D, 1883.

269,848. Ore-Separator. Alvan P. Granger, Denver, Colo.
269,952. Hand Rock-Drill. Eugene Moreau, San Francisco, Cal., Assignor to Theodore W. Sterling, same place.
270,004. Process of Depositing Metals upon the Surfaces of Iron and Steel Coated with Magnetic Oxide. George Bower, St. Neots, County of Huntingdon, England.
270,005. Furnace for Effecting the Protection of Iron and Steel Surfaces. George Bower and Anthony S. Bower, St. Neots, County of Huntingdon, England.
270,007. Equalizing Apparatus for Pumping and Other Machinery. Charles Bridges, San Fernando, Cal.
270,149. Coal-Hopper. William Swindell, Alleghany City, Pa.
270,156. Amalgamator and Concentrator. Bryan Tyson, Washington, D. C.
270,157. Boiler-Furnace. Ezra W. Van Duzen, Newport, Ky.
270,175. Fire-Brick. William Batty, Philadelphia, Pa., Assignor of one half to George H. Perkins, same place.
270,182. Ventilator for Blast-Pipes. James Devine, St. Louis, Mo., Assignor of one half to Franz Krein, same place.
270,184. Puddling-Furnace. John Evans, Etna, Assignor of one half to Sprang, Chalfant & Co., Alleghany City, Pa.

GRANTED JANUARY 9TH.

270,217. Pulverizing Machine. Ryerson D. Gates, Chicago, Ill.
270,259. Ore-Separator. Charles W. Stickney, Washington, D. C.
270,274. Brick. William Q. Adams, Portsmouth, O.
270,281. Apparatus for Superheating Steam and Heating Air. Solomon N. Carvalho, New York City.
270,315. Miner's Combination Tool. John Jones, Oregon City, Oregon.
270,316. Miner's Candlestick. John Jones, Oregon City, Oregon
270,359. Drying-House or Kiln. William A. Allen, Jersey City, N. J.
270,365. Machine for Sharpening Drills. J. Sellers Bancroft and William H. Thorne, Philadelphia, Pa., Assignors to William Sellers, same place.
270,366. Drill. J. Sellers Bancroft and William H. Thorne, Philadelphia, Pa., Assignors to William Sellers, same place.
270,391. Dumping-Wagon. John G. Coburn, South Carthage, Assignor to himself and George B. Staples, Carthage, Me.
270,488. Drilling Apparatus. William L. Saunders, Jersey City, N. J.
270,489. Process of Testing Oils. Julius Otto Schubert, Parkersburg, West Va.
270,490. Combustion-Chamber for Steam-Boilers. James Scott, Pittsburg, Pa.
270,492. Gold-Separator. Nelson Seymour, Erie, Pa.
270,515. Steam-Pump. George B. N. Tower, New York City, Assignor of one half to Edward L. Lambie, Washington, D. C.
270,516. Ratchet-Drill. William M. Turner, Pensacola, Fla.

REISSUE JANUARY 9TH.

10,267. Explosive Compound. The Giant Powder Company, San Francisco, Cal., Assignee, by mesne assignments, of Alfred Nobel.

GRANTED JANUARY 16TH.

270,574. Steam Pumping-Engine. George F. Blake, Belmont, Mass.
270,582. Furnace Fire-Bars. James G. Galley, Forest Gate, County of Essex, England.
270,613. Rock-Drill. Charles W. Stickney, Washington, D. C.
270,653. Feeding Air to Furnaces. Thomas Mara Fell, Brooklyn, N. Y.
270,671. Means for Operating Pumps in Deep Wells and Mines. John M. Huffer, Jacksonville, Oregon, Assignor of one fourth to C. C. Beekman, same place.
270,689. Mining-Car. Gustav Olsen, San Francisco, Cal., Assignor of one half to Edward A. Rix, same place.
270,736. Coal-Chute. Isaac Burnett and Joseph E. Clifton, Geneseo, Ill.
270,756. Bucket for Conveying Ensilage, Coal, Plaster, etc. Jerome A. Cross, Fultonville, N. Y.
270,762. Lubricator. Levi P. Dollison, Wabash, Ind.
270,763. Manufacture of Sulphuric Acid. Thomas D. Dotterer, Charleston, S. C.
270,823. Gold Washer and Amalgamator. George W. Kirk, Washington, D. C.
270,825. Ore-Sizing Apparatus. Ira F. Monell, Crisman, Colo.

GRANTED JANUARY 23D.

270,892. Coal-Oil Stove. Howard Daisley, Brooklyn, N. Y., Assignor to Ray, Daisley & Co., same place.
270,900. Pump. Surn Jackson, Stockton, Cal.
270,901. Wrought-Iron. William F. Jordan, Brooklyn, N. Y.
270,905. Dumping-Cart. William Loughridge, Baltimore, Md.
270,906. Method of Milling and Apparatus used therein. Abel Mariotte, Véreux, France.
270,919. Coal-Chute. John Vinson, Knoxville, Tenn.
270,956. Ore-Concentrator. Charles Kleinschmidt, Breckenridge, Colo., Assignor to Emilie Kleinschmidt and Caroline Ambrasius, both of Cleveland, O.
270,989. Furnace. George R. Scates, Knoxville, Tenn.
271,090. Manufacture of Anhydrous Sulphide of Zinc. Thomas MacFarlane, Actonvale Quebec, Assignor of one half to Alexander Ramsay, Montreal, Can.
271,115. Portable Hoisting-Machine. Louis T. Pyott, Philadelphia, Pa.
271,138. Rock-Breaker. William S. Sharpneck, Blair, Nebraska, Assignor of one half to Green Majors, same place.
271,144. Drying-Kiln. Garrett F. Speer, Philadelphia, Pa.
271,162. Apparatus for Amalgamating and Separating Gold, etc., from their Ores. Sylvanus L. Trippe, Chicago, Ill., Assignor of one half to Abel H. Bliss, same place.
271,168. Power Rock-Drill. John B. Waring, New York City, Assignor to the American Diamond Rock-Boring Company, same place.

GRANTED JANUARY 30TH.

271,211. Automatic Fan. Charles H. Blanchard, Batavia, O.
271,285. Ore-Pulverizer. Jerome B. Sweetland, Pontiac, Mich.
271,305. Amalgamator. Augustus C. Bowen, Michigan Bluff, Cal.
271,386. Coal and Ore-Chute. George H. White, Escanaba, Mich.
271,393. Furnace. Jacob Altmeyer, Benwood, West Va.
271,418. Furnace. John Carson, Cleveland, O.
271,437. Brick and Fire-Proof Lining for Furnaces. George Duryee, New York City.
271,442. Reverberatory Furnace. George Fenwick, Gateshead, County of Durham, and Brodie Cochrane, Durham, County of Durham, England.
271,450. Pneumatic Apparatus for the Separation of Minerals, etc. Benjamin W. Hart, London, England.
271,508. Grate-Bar for Furnaces, etc. John F. Newton, Jr., Boston, Mass., Assignor to Edward Bertram Newton, same place.
271,523. Steam-Boiler or Generator. Claus Russmann, Hamburg, Germany.
271,537. Heating Apparatus. Roy Stone, New York City.
271,541. Steam-Boiler. Henry H. Suplee, Philadelphia, Pa.

FINANCIAL.

Gold and Silver Stocks.

NEW YORK, Friday Evening, Feb.

The aggregate number of shares dealt in at the Mining Exchanges this week exceeds that of last, but there is no marked change, either in prices or in dealings, to report. Sonora Consolidated has occupied most of the attention at the New York Board, and the transactions have exceeded that of any other two stocks dealt in.

The Comstocks show a little improvement in price, but have had a moderate business. The Leadville stocks have been quiet and steady. The Tuscarora stocks show a marked decline in the whole list, due mainly to bad reports circulated about the Navajo mine. Sierra Grande and Robinson have both been dealt in largely, but show no change in price. A summary of the market will be found below. The total number of mining shares sold at all the Exchanges aggregates 591,075, as against 449,560 last week.

The Comstock shares had a fair business at steady prices. California was strong, with a moderate business, selling from 18@25@24c. Consolidated Virginia has been quite active at steady prices; it sold from 49@58c. Sierra Nevada sold from $2.75@$3.50, with transactions of 1085 shares. Union Consolidated has been quiet at very irregular prices, selling from $3¼@$2⅛. Mexican, under a small business, has shown some strength, selling from $2⅛@$2⅞. Ophir was quiet and strong, selling from $2⅝@$3⅛. Consolidated Imperial had a small business at steady prices, selling from 11@10c. Best & Belcher was very quiet at $3.70@$3.90. Sutro Tunnel has had a fair business at steady prices; it sold from 21@25@21c.

The Leadville stocks were quiet and steady. Amie records a large business and was steady; it sold at 22@20@21c. Chrysolite was quiet and steady, selling from $1.40@$1.50@$1.45. Dunkin, with a small business, was steady at 33@30c. Hibernia sold at 4@3c. with transactions of 2000 shares. Iron Silver records a small business at strong prices; it sold from $2.75@$2.80. Leadville was quiet and steady, selling at 63@67c. Little Chief had a small business at steady prices, selling from 43@40c. Big Pittsburg, under small transactions, was strong; it sold from 16@23@22c. Climax was quiet and about steady at 10@8c.

The Bodie stocks were very quiet at irregular prices. Bodie was quiet and very irregular, selling from $1.75@$1.25@$1.60. Standard was also very irregular, with a fair business; it sold from $5¼@$5¼@$5⅛. Bulwer records a small business at steady prices, selling from 89@95c. Goodshaw sold at 7c.

The Tuscarora stocks have experienced a sharp decline under a small business. Grand Prize was quiet and weak at 90@75c. Tuscarora sold at 10c., with one transaction. Belle Isle records a very small business and was weak, selling at 95@70c. Navajo was the weakest of the list of these stocks, falling from $6⅛@$5⅛, closing at the latter figure; the sales amounted to 8100 shares. North Belle Isle was quiet and irregular, selling at 60@63@52c. Independence was quiet and steady at 75c. Elko Consolidated was very active at very irregular prices; it sold from 8@15@14c.

In the miscellanous list, Alice continues strong, and had a fair business, and sold from $2.45@$2.75. Eureka Consolidated was quite weak to-day, selling as low as $8.50; it sold all the week at $10. The Green Mountain stocks show some improvement, under a small business. Gold Stripe sold from 5 @c. Green Mountain was strong at 60@70c. Rising Sun sold from 4@5c., and Cherokee sold at 5@6c. Hall-Anderson records a very large business, and has been quite weak; it sold from $1.75@$1.35@$1.45. Homestake has had a fair business at irregular prices, selling from $17⅛@$18@$17⅛. Horn-Silver, under a moderate business, has been weak; it sold from $7@$5. Hukill has been a little weak, selling from 22@17c. Ontario records a small business, and has grown quite weak; it sold from $34@$28@$28¼. Prussian was quiet and strong, selling at $4.65@$4.75. Robinson Consolidated has been quite active at steady prices, selling from $1.15@$1.05. Sierra Grande records an active business at irregular prices; it sold from $2.65@$2.45@$2.60.

Albion has been quiet and strong at $1.35@$1.50. Bradshaw has had a fair business at irregular prices, selling from 31@35@33c. Central Arizona sold from 41@37c. under a small business. Decatur has been quite active at steady prices, selling from 9@10c. Enterprise records an active business on the American Board at weak prices; it sold from 61@47@49c. Harlem M. & M. Co. has been quiet and steady at $1.05@$1.10. Oriental & Miller records an active business at prices a little weak, selling from 16@14. Sonora Consolidated has been the most active stock in the market. It has been quite strong, selling from 15@25@23c., closing at 22c. The sales aggregate 128,100 shares. South Pacific has been active and steady at 8@9c. The State Line stocks record a moderate business at weak prices; Nos. 1 and 4 sold from 4@3c., and Nos. 2 and 3 from 7@8c. Taylor-Plumas has been very active at irregular prices; it sold from 19@20@18@19c.

MEETINGS.

Quicksilver Mining Company, 19 Nassau street, New York. Annual meeting of stockholders and election of trustees, February 25th, between two and three P.M.

DIVIDENDS.

The Holyoke Mining Company, of Idaho, has declared its fifth dividend of two per cent on its capital stock, payable February 12th. Transfer-books closed February 6th, and reopen February 13th.

The Kentuck Mining Company, of Nevada, has declared a dividend of ten cents per share.

The Navajo Mining Company, of Nevada, has declared a dividend of twenty-five cents per share.

The Shoshone Mining Company, of Idaho, has declared its regular monthly dividend of one per cent, payable on the 16th inst.

The Standard Consolidated Mining Company, of California, has declared a dividend of twenty-five cents per share, payable February 12th, at the Farmer's Loan and Trust Company.

PIPE LINE CERTIFICATES.

Messrs. Watson & Gibson, Petroleum and Mining Brokers, 55 Broadway, report the following for the week ended February 8th, 1883:

Total sales for the week in the three New York City Exchanges 9,865,000 barrels. The highest price within that time, $1.05¼, the lowest $1.00½. The trade has in fact been relatively very dull during the past week, Tuesday having been the most active day at advancing figures, owing to the report that morning that the McKinney and the Book & Grace wells both came in dry. During the past three weeks, there has been a succession of adverse and discouraging reports from the oil-fields, new wells coming in dry and the Forest County wells rapidly declining. This failure to obtain new producing wells and decline in production, although not resulting in much discrepancy between production and consumption, has given an impetus to bull speculation. The bulls also point to the fact that exploration is not more than one third as great as at this time last year, the number of wells now drilling being 255 against 850. But one year ago oil was selling for 85 cents per barrel. The daily production then was about 76,000 barrels, against 60,000 now. Another bull argument is the enlarged constituency of those who are trading in oil, and as the public are nearly always bullish, this naturally helps to absorb the certificates. Money too, can be obtained more freely and on better terms on Pipe Line certificates than heretofore, which encourages bull speculation. On the other hand, the bears point to the fact that money at six per cent interest, and storage charges added, make a tax of about 2 cents per barrel per month. Add to this the commissions, and it is at once seen that a dull stationary market is fatal to bull profits, and that a sharp advance is necessary to make a profit on the long side. The bear saves the expenses of carrying oil, though oil may be well worth $1.05 per barrel. It is to the interest of a great consumer of crude oil like the Standard Oil Company, in converting it into refined, to occasionally depress the speculative market far below intrinsic value, in order to lay in its supplies. The tremendous fluctuations in oil each year in the past can not be explained on any other hypothesis than "a one-man power." The present stock of oil in the custody of the Pipe Line Company is nine millions in excess of the stock in sight one year ago, and the visible supply of refined oil in nine European ports on January 31st, 1883, was 876,000 barrels in excess of January 31st, 1882. This is more significant when it is remembered that the oil exports of 1882 were less than in 1881, which would indicate a diminished consumption in Europe. Brokers and customers are almost all bullish, and consequently long. As a great deal of oil is carried on light margins, a serious break is always possible. Notwithstanding intrinsic value for oil, as in other speculation, every one except bears is reluctant to buy on a falling market, and the short interest in oil is too small to afford any support to the market in the event of a decline.

Copper and Silver Stocks.

Reported by C. H. Smith, 15 Congress street, Boston, Stock Broker and Member of the Boston Mining and Stock Exchanges.

BOSTON, Feb. 8.

There has been but little doing in mining stocks the past week, and the tendency has been to lower prices as a rule for the copper stocks, although in the later dealings a somewhat better feeling is manifested. Calumet & Hecla declined to $241½, but rallied again to $243, and closed quite strong at that figure. Franklin declined from $14½ @$13½ on smaller sales. Pewabic declined from $9½@ $8 on sale of 100 shares only. Quincy has been the most active stock on the list. Opening at $49¾, it declined to $48¼, rallied to $51, and later declined to $50, closing $50 bid, $51 asked. Osceola declined from $31@ $30. Huron sold at $1¼. The above comprises all the copper stocks dealt in at the regular Board, showing the extreme dullness of the market and the absence of any speculative demand for this class of securities.

In silver stocks, San Pedro has been active, declining early in the week from 60@30c., with a rapid advance on small sales to 75@77½c., at which price quite large blocks were taken, closing strong at 75c. bid. Bonanza has held its own at $2¾@$2⅞. Catalpa, quite firm at $1@$1.05, the last sales being at 97½c., the lowest for the week. Crescent, dull at 40@42½c. Harshaw has been in better demand, and advanced from 75c. to $1. Sullivan declined from 75c.@62½c. Napa sold at $3½, and Brunswick Antimony at $13.

At the Boston Mining and Stock Exchange, the feature for the week is the decline in Massachusetts & New Mexico from 16@8c. on a rumor that a reorganization and an assessment are contemplated. The bonds are offered freely at 20 per cent. Empire declined to 26c., Deer Isle to 11c. In miscellaneous stocks, an active business is transacted at generally higher prices.

3 P.M.—The market this afternoon developed no special features. Bonanza sold at $2¾. Catalpa, 97½c. Harshaw, $1. San Pedro, 75c. Calumet & Hecla, $243. Quincy, $50 bid, $51 asked. Franklin, $13@$13¼. Pewabic, $8@$8½. Atlantic, $14 asked. Osceola, $29 bid. Huron, $1¼ bid. National, $1¼ bid. Silver Islet, $6 bid, $7 asked.

REVIEW OF THE SAN FRANCISCO MARKET.

The San Francisco market has been quite active, the Comstock shares coming in for a good share of the dealings, at strong prices. The chief stock dealt in was Hale & Norcross, although the price has been irregular, being quite strong in the middle of the week but growing weaker toward the close. There is no special news from the mine, and there are different

opinions regarding it. There has been a break in the Tuscaroras and more particularly in Navajo. Damaging reports were circulated regarding the mine, which, it is said, the large owners heard with indifference and refused to support the stock. Consequently it suffered a sharp decline. The other outside stocks were quiet.

IRON MARKET REVIEW.

NEW YORK, Friday Evening, Feb. 9.

American Pig.—There has been a little more activity, due principally to concessions in prices. Furnaces in Western Pennsylvania are blowing out, in consequence of an accumulation of stocks, while on the Lehigh there seems to be a tendency to increase the output. Choice brands of No. 1 Foundry are still firm at $26, but ordinary and standard brands are weaker, being quoted $24@$25, while occasional outside lots are offered at even $23.50. We quote No. 2, $22.50@$23.50, and Forge, in which the weakness is most perceptible, $20@$21, at tidewater. We note the sale of 3000 tons of Thomas pig at figures near our quotations.

The stove manufacturers, at a meeting held in this city yesterday, seemed generally convinced that there had been an over-production in their goods, which does not augur favorably for the foundry trade.

Bessemer pig-iron is dull and unchanged, with England quoting by cable 52@54s. 6d.

Spiegeleisen is dull and weaker with rumors of sales at lower figures than quotations, which are for 20 per cent, $32.50@$33, and for 10 to 12 per cent, $27.50@$28.

Scotch Pig.—The market is reported a little more active, consumers apparently taking advantage of low prices. The arrivals are fair, and only a part goes into store. Freights are unchanged, and, as will be noted by the cable quotations below, Glasgow is practically unchanged. We quote: Coltness $25@$25.50; Glengarnock and Carnbroe, $22@$22.50; Gartsherrie, $24@$24.50; Langloan, $24@$24.25; and Eglinton, $21@21.50. The Wall Street Exchange has received the following cables to-day: Carnbroe, 53s. 3d.; Gartsherrie, 62s. 3d.; Summerlee, 62s.; Coltness, 65s.; Langloan, 65s. 6d.; Glengarnock, 55s. 6d.; and Eglinton, 49s. 9d. Warrants are 47s. 4d., a little lower.

Rails.—The market is weaker, and orders to the extent of about 15,000 tons have been placed at $39@$40 at mill, which we quote, with the feeling in buyer's favor. The steel bloom case tried in this city against the Custom-House has been decided in favor of the plaintiffs.

Old Rails.—The market has been very quiet, the only transactions we hear of being a small lot of D. Hs. at $27½. Ts are nominally $24.50.

Scrap.—Nothing has been done. We quote nominally ex ship $25@$25.50.

NON-DIVIDEND PAYING MINES.

A special committee on old iron and steel of the New York Iron and Metal Exchange has, after considerable discussion and correspondence, prepared the following official classification of wrought scrap-iron, for a copy of which we are indebted to Mr. Edward J. Shriver, Secretary:

No. 1 wrought scrap-iron shall consist of all wrought-iron other than plates (except when cut apart and free from angles and rivets), to be one quarter inch thick or upward, round and square, but not of such unusual size or shape as can not be worked by ordinary methods. It must be free from rails, rail ends, nails, anvils, hoes, shovels, gas-pipe, flues, stove-pipe, sheet-iron, hoops, wire and similar light iron, cast, malleable, galvanized, tinned or coppered iron, zinc, steel, or other foreign substances, also from burnt or excessively rusty iron.

No. 2 wrought scrap-iron shall consist of unwieldy pieces, such as large anchors, ship's knees, armor-plates, heavy cranks, heavy shafting, I beams, Tees, angles, or other iron of such unusual size as can not be worked by ordinary methods.

No. 3 wrought scrap-iron shall consist of wrought-iron, unfit to grade as No. 1 or No. 2, but must be free from

METALS.

NEW YORK, Friday Evening, Feb. 9.

Copper.—The market is still a little unsettled, although the small lots of Arizona and other copper forced on the market by bankers who had advanced on them have been absorbed. Holders of Lake copper, of which very small quantities are in second hands, ask 17⅛@18c., and there have been sales at the lower figure in a small way, while some buyers decline to take hold even at that figure. About 200,000 pounds of Arizona copper, guaranteed, have changed hands at 17⅛@17¼c. while Baltimore is held at 16¾c., and other less known brands have been selling at less. In the interest of a great and growing industry, it is time that producers should make some efforts to teach consumers that the difference between different brands of copper refined by men of experience from a good raw material are not as great as the ruling quotations would make it appear. Buyers should not be perplexed with an endless number of brands.

London cables Chili Bars, £55 5s.@£65 10s., and Best Selected £72@£72 5s.

Tin.—Considerable business has been done during the week under the stimulus of better quotations from abroad. Straits has sold here at 21c., and is now held at 21⅛@21¼c. London at the close cables £93 5s.@£93 10s.

Lead.—In the beginning of the week, a sale of 200 tons of Common was made at 4·60c. On Thursday, the second lot of Germania lead, 360 tons, just arrived from San Francisco, was offered for sale and disposed of at 4·50c., as no better bid could be obtained. Since then, nothing has been done, although a few hundred tons could probably be placed at the same figure, which some holders decline to consider. The stock here is small, but it is believed to be heavy in the West. London cables £13 10s.@£13 15s.

Spelter.—This metal continues excessively dull, with 4¼c. bid and 4⅝c. asked for common Domestic. The last arrivals of Foreign were on the 16th of January, and since then no Silesian spelter has been received here. What little there is on hand is not offered at less than 5·10c. London cables £15 10s.@£15 15s.

Antimony.—This metal is dull and lifeless at 10@10⅛c. for Hallett's, and 11@11⅛c. for Cookson's.

COAL TRADE REVIEW.

Anthracite.

NEW YORK, Friday Evening, Feb. 9.

The anthracite coal market is exceedingly dull and quiet, more so in fact than it has been for many years at this time of the season, which is never remarkable for activity. There is a pressure to sell, and the consequence is, that low prices prevail, even fancy coals being offered at a concession. Restricted as is the market during the winter season, the slightest causes will upset it, and the full time last week has not improved matters. Buyers are persistently holding off, waiting for developments. The demand in the East has been better of late; but the fact that only small vessels are wanted, which are scarce, tends to limit the business. Besides, the greater abundance of water has to some extent eased the mills which were running short of coal.

The production for the week ended February 3d, 1883, was 476,109 tons, against 469,130 tons for the corresponding week in 1882. The total for 1883 up to February 3d was 2,106,329 tons, against 2,100,480 tons in the same period last year, an increase in 1883 of 5849 tons.

Bituminous.

The bituminous coal trade is very quiet and dull. Prices are nominally $4.50@$4.65 for Clearfield alongside, and $4.60@$4.85 for Cumberland, according to quality.

STATISTICS OF COAL PRODUCTION.

The Transportation of Coke over the Pennsylvania Railroad for the week ended January 27th and year from January 1st:

Tons of 2000 lbs.	Week.	Year.
Penn. RR. (Alleghany Region)	1,589	7,767
West Penn. RR	1,333	9,321
Southwest Penn. RR	37,345	153,300
Penn. & Westmoreland Region, Pa. RR	6,032	22,863
Pittsburg, Penn. RR	39	80
Snow Shoe (Clearfield Region)	369	356
Total	46,707	193,187

Comparative statement of the production of anthracite coal for the week ended February 3d and year from January 1st:

BULLION MARKET.

NEW YORK, Friday Evening, Feb. 9.

Under lower exchange on India and absence of continental orders, the London market for silver has weakened since our last issue, as indicated by the figures of annexed table of prices current here.

DATE.	London Pence.	N. Y. Cents.	DATE.	London Pence.	N. Y. Cents.
Feb. 3	50 9-16	110¾	Feb. 7	50½	110¼
Feb. 5	50 9-16	110⅞	Feb. 8	50⅝	109⅞
Feb. 6	50½	110¼	Feb. 9	50 7-16	110

Bullion Receipts at New York.—The bullion received from the mines at the various offices in this city during the week ended February 9th, as compiled from various sources, amounted to $151,295.02, as against $288.263.71 reported for the previous week. The receipts from January 1st, 1883, to date, are $1,823,173.51.

Exports and Imports of Gold and Silver at New York.

Exports.

Week ended February 3d	$176,000
Corresponding week last year	3,750,840
Since January 1st, 1883	1,234,814
Corresponding period last year	4,811,520

Imports.

Week ended February 3d	$75,819
Corresponding week last year	65.787
Since January 1st, 1883	618,295
Corresponding period last year	404,862

Foreign Bank Statements.—The governors of the Bank of England, at their regular weekly meeting, made no change in the bank's minimum rate for discount, and it remains at 4 per cent. During the week, the bank gained £280,000 bullion (supplemented by a gain of £9000 on balance to-day), but the proportion of its reserve to its liabilities was reduced from 47 13-16 to 46⅛ per cent, against 33⅛ per cent at this date last year. The weekly statement of the Bank of France shows gains of 9,175,000 francs in gold and 1,975,000 francs in silver.

BULLION PRODUCTION FOR 1882.

We give below a statement showing the latest bullion shipments. These are officially obtained from the companies, where that is possible; and where official statements can not be procured, we take the latest shipments published in those papers nearest to the mines reported. The table gives the amount shipped for the week up to the date given, as well as the aggregate shipments to such date from the first of January, 1882.

The shipments of silver bullion are valued at $1.29·29 per ounce troy; gold at the standard $20.67 per ounce troy. The actual value of the silver in the following table is therefore subject to a discount, depending on the market price of silver. If the price of silver be counted at $1.12 an ounce, which has for some months been about its average value, the following figures, where they relate to silver bullion, should be diminished by about 13½ per cent, to arrive at actual value.

MINES	States.	For the week.	Month of December.	Year from Jan. 1st, 1882.

GOLD:

ITS OCCURRENCE AND EXTRACTION,

Embracing the Geographical and Geological Distribution and the Mineralogical Characters of Gold-Bearing Rocks.

BY

ALFRED G. LOCK, F.G.S.

EDITED BY

CHARLES G. WARNFORD LOCK, F.L.S.

Editor of Spons' Encyclopædia of Industrial Arts.

PRINCIPAL CONTENTS.

CHAPTER I.—Geographical Distribution. This chapter is broken up into five sections, representing the five great divisions of the world, each of which is illustrated with a double-page map showing the golden regions. Under each section, the several countries composing it are dealt with in alphabetic order; maps are given of the chief gold-fields, together with full accounts of the local geology, the character of the deposits, the fineness and impurities of the gold, the native and other modes of working, statistics of the yield, and every information having a direct or indirect influence on the commercial prospects of the gold industry.

CHAPTER II.—Geological Occurrence and Mineralogical Association. Here is included a synopsis of the various theories concerning the origin and *formation of auriferous* deposits and the growth of nuggets. The geological zones in which gold is found are described in sequence, with allusions to the particular localities. Some space is devoted to an examination of the various minerals with which gold is associated in nature, and a discussion of their influence (good or bad) on the richness of the ore.

CHAPTER III.—Shallow Placers and Live Rivers. This chapter is profusely illustrated with sections showing the manner in which shallow placers are formed, and where the gold should be sought for in them. A minute account (with diagrams) of the various apparatus in use for washing alluvial gold is supplemented by much absolutely new matter on the recovery of gold from running streams, now beginning to attract such wide attention.

CHAPTER IV.—Deep Leads or Dead Rivers. This very important subject is thoroughly exhausted on the same plan as Chapter III., the geological sections being of special interest.

CHAPTER V.—Hydraulicking. Proper details are given of the construction of all the apparatus employed in this branch, both for applying the water and saving the gold, with numerous examples of actual cost and profit, and many illustrations of operations in California and New Zealand.

CHAPTER VI.—Auriferous Veinstuff. Under this head are given many sketch-sections of quartz-veins, illustrating their peculiarities and variations. This is followed by a complete description of the construction of stamp-batteries in detail, with accounts of novel forms of reduction machinery. The appliances for arresting the gold liberated by the stamps occupy a large amount of space, and are exhaustively treated—several examples of complete mills, with their working results, being described and illustrated in full.

CHAPTER VII.—Auriferous Ores. This chapter deals with the complicated ores usually termed "pyrites." The nature of the association between the gold and the ores is analyzed with a view to lessening the loss now commonly incurred in their treatment, and several new processes are described with this object. On the whole, this is perhaps the most important part of the volume.

APPENDIX A.—Literature bearing upon the subject.

APPENDIX B.—Glossary of technical and foreign terms, and equivalents of foreign moneys, weights, and measures.

A Geographical Index and a General Index complete the work.

In one large volume, of 1229 pages, super-royal 8vo, cloth, illustrated with 6 double page Maps and 185 wood engravings. Price, $20, postage prepaid.

MR. J. TROWBRIDGE BAILEY leaves on the 20th of March for a trip through the mining districts of Arizona, Colorado, and New Mexico. Those desiring to communicate with him should address him at the office of Mr. E. O. READ, 73 Broadway, this city.

THE year 1882 has, as usual, been one of prosperity financially to the Patent-Office and one of misery to all who have dealings with that institution, because our enlightened legislators are unwilling or unable to understand that the Patent-Office was never intended to be a money-making concern, and has no right to be one. It is absurd that more than four hundred thousand dollars should be added in one year to a fund which has reached the respectable sum of over two million dollars, when every employé of the office is so crowded with work as to cause hurried performance and unnecessary delays, and to give occasion for the litigation which is making patents such uncertain property. A reasonable employment of the annual surplus in the payment of salaries to an additional force will do much toward reforming existing evils. Last year, the Patent-Office received 31,522 applications, and 20,518 patents were granted and certificates were issued.

THE tariff debate in both houses of Congress drags on wearily with little prospect of a settlement. The Senate has gone over its former work, and by a disgraceful system of log-rolling has again changed a number of very important rates, among which a series in the metal schedule are prominent. As a general thing, the amendments carried have provided for higher duties, the champions of the iron and steel interests leading in the fight for the good cause. The irrepressible iron ore men have once more appealed with characteristic modesty for $1 per ton, and when they could not get that, stood out bravely for 75 cents, which, also, was denied them. The pig-iron producers rejoice in a little victory, which, however, we fear, will not save them from the ruin that is staring them in the face. Nothing but a duty of $7 per ton can do that, and the $6.50 rate passed can only prolong the agony, which would have been brief if the former reckless decision of the Senate to reduce to $6 had been adhered to.

In the House of Representatives, the steel clause was amended so as to make the duty 45 per cent *ad valorem*. The wire cloth and netting duty was changed to two cents in addition to the rate paid for the wire of which it is made ; iron wire rope has a similar additional rate of one cent, and steel rope of two and a half cents. Nickel has received another blow, which will place Mr. JOSEPH WHARTON, of Philadelphia, according to his own statement before the Tariff Commission, in the disagreeable position of being forced to close down his poor mine and close his unremunerative works. The House makes the duty 15 cents per pound.

The proceedings of Congress are no longer watched with eager interest, because it now seems pretty well settled, as we have stated on previous occasions, that nothing will be done. The agitation has undoubtedly done much harm to the business interests of the country. But though it has stayed the current of trade, it can not check for a long time the very favorable influences now at work. There is every assurance now that our farmers will get very liberal prices for the remainder of the heavy crop of last year. Our exports are going on at an increasing rate, and when buyers in all branches have begun to replenish their exceptionally depleted stocks, the wheels of trade will move at a much more rapid rate than at present.

TAXATION OF MINES IN COLORADO.

We publish this week the text of a bill which has just passed the lower house of the Colorado Legislature, and is now pending in the Senate. It is the natural consequence of the failure of the local officers in Leadville to extort a tax on profits from the mining companies there two years ago. The mining companies united to resist this attempt, and the courts decided in their favor. The sovereign authority of the State in matters of taxation is, however, of course, competent to impose even an onerous, unjust, and impolitic tax ; and to this authority appeal has now been made in the supposed interest of the farmers and ranchmen, who would rather squeeze individuals and companies engaged in mining than pay taxes themselves. The former attempt to tax the profits of mines was pronounced illegal because the legislature had provided no definite method and means for the assessment and collection of such a tax. This deficiency the present bill supplies. It provides for annual returns to be made under oath, showing the gross product of each mine, the amount of ore reduced, and the actual cost of mining, hauling, and reduction ; and it declares the "net proceeds" to be subject to the usual assessment and collection of personal taxes, which are to be collected of the owner *or lessee*, and yet are to be, in default of payment, a lien on the mine itself—personal taxes, collectible on real estate !

The injustice of this tax consists in its character as an income-tax, levied on a single industry, while all others are exempt. Farmers, ranchmen, and merchants are not obliged to make annual exposure of their transactions, and to pay a tax on their profits. So far as taxes on personal property are concerned, this law would cause the same property to be twice taxed ; for the profits of a mining company, divided among its stockholders, would become their personal property, and as such liable to taxation.

The hardship of the proposed special tax, if it should be put into practice, would be found in the fact that it is to be assessed and collected by the county authorities. In the mining counties, the capital employed in mining would thus be exposed to plunder without protection. A uniform tax, levied by the State, would be infinitely less alarming. There is, under this bill, no limit to the amount which "rings," such as the one which a couple of years ago governed Lake County, might extort from helpless mine-owners under threat of confiscation.

The impolicy of such taxation is plain enough. To invite capital into a frontier region by every kind of glowing promise ; to encourage "permanent investments" of large sums, and then to treat the investor as "fair game" for the pot-hunters of politics, is a course which brings its own swift punishment. The mining industry of Colorado is not so prosperous that it can bear burdens not carried by any other. The new splendors of Denver bear witness to the profits realized by selling mines, not working them. And already it has become far less easy than formerly to sell Colorado mines, since Colorado juries have practically nullified the law which was intended to protect the rights of mine-owners. If the Legislature now joins in this short-sighted policy, there will be additional reason for capital to avoid that State and seek regions where the era of such oppression has not yet begun. The value of every mine, every

Digitized by Google

town lot, every mile of railroad, every stock of goods, every business in the State, will be affected by a measure which strikes thus at the industry constituting the real foundation of the whole.

We trust that the Senate or the Governor will refuse to take part in such a cow-boys' raid. *

Since the above article was written, we have received news that the bill has passed the Senate; and our *informant* adds that it will doubtless be signed by the Governor. The leading journals of the State denounce it as unconstitutional (which may or may not be the case) and outrageous which is certainly the case). We only wish its effects could be confined to the unscrupulous demagogues who *contrived it.*

CORRESPONDENCE.

[Communications will be noticed only when accompanied with the full name and address of the writer. Unless specially desired, only initials will be printed. We invite criticism and comment by the readers of the ENGINEERING AND MINING JOURNAL. Replies not intended for publication should be addressed to the Editor of the ENGINEERING AND MINING JOURNAL in blank, stamped, and sealed envelopes.]

The Increase of Richness with Greater Depth.

EDITOR ENGINEERING AND MINING JOURNAL:

SIR: In Overman's *Practical Mineralogy* I read of the Washington and other mines in North Carolina and Virginia as being veins of pyritous talcose slate, yielding from 12 to 60 ounces of silver, worth about $2 to the ton. Now, I know of similar veins here, situated in the heart of a rich mineral region, which are passed by and apparently despised by every prospector that comes along. Some of these have been worked to a depth of ten or fifteen feet, and abandoned because the assays do not exceed, at that depth, five or ten dollars. Overman says that this class of mines is really of more worth than those that assay much higher, and I am inclined to believe his conclusions are good. From what is known of such mines in the States mentioned, is it not probable that those here will increase in value at a greater depth; and if so, what would be the probable depth at which twenty-five ounces to the ton could be reached? Could not these mines be made to pay as they stand, starting say with five or ten dollars? A little light on this subject will much oblige yours respectfully, W. R. M.

NEPHI, JUAB CO., UTAH, Jan. 24.

We have been unable to find, in the work cited, the passage alluded to; but there is evidently an error, either in our correspondent's quotation or in the original, as from 12 to 60-ounce silver ore is worth more than $2 to the ton. We do not believe that our correspondent or any one else is safe in reasoning that, because ore has grown richer with greater depth in one district, it will probably do so in another. There are striking instances both of enrichment and of impoverishment in depth, and only actual development can serve as a guide in a new district.

American Companies in Sonora.

EDITOR ENGINEERING AND MINING JOURNAL:

SIR: Your JOURNAL of December 30th contains a communication headed "Mining Matters in Sonora, Mexico," which needs a few words of correction. The Mulatos mine, requiring millions of dollars for its purchase and working on a grand scale, and also an intelligent, economical, and honest management, is not a mine for American capital to invest in. Let the Mulatos go to England, where they know how to work mines. I know the Mulatos mine well, and also its "beans and tortillas" eating proprietors.

As far as the *fiasco* of Santa Maria is concerned, I can state, that half of the foreigners here believe it a *fiasco*, while the other half think that it will come out all right. The truth will become known after the big mill, now building, has been at work for some time.

But why does your correspondent not mention the Delicias mining enterprise, it being the only American company in this State that is properly managed? Its sixty-stamp mill is in Guaymas, and when in operation will make the Delicias one of the best paying mines in Sonora.

The Subiate, now in bonanza, and sold for $250,000 to English capital, will turn out a pearl of a little mine. It was first sold to an American company; but as the parties sent out a manager who pronounced it "no mine" without going into it, the purchase was not completed, and the company lost $60,000. Was this the fault of Sonora?

The Prietas Company, now at work again, is making large shipments of gold bullion. During the litigation, the mine was opened to a very considerable extent, and it is certain that there must be ore enough in sight to run the mill for some time. As regards the third, 315-foot (deepest) level, some say that it is all in *borra*, while others say that with it they struck a big silver bonanza.

The San Antonio Company was got up by an irresponsible party, and was poorly managed. Is it the fault of Sonora that hundreds of thousands were sunk there? Certainly not, since in fifty—nay in a hundred—other mines the money could have been laid out to advantage.

The Juarez built up a mill before they knew whether or not they had any water to run it with. Was that the fault of Sonora?

The Felicidad was started with insufficient means, and, although warned on all sides, took Mexicans in as partners. A litigation was the consequence, and bad management did the rest. Was this the fault of Sonora, the mine being a good one? Certainly not.

The San Juan de Dios Company put up a twenty-ton smelter, for which the ore of the mine is not fit, it being milling not smelting ore. The mine has changed hands, and will be brought on the market as a paragon, which it is not. It may, however, turn out a good little mine. The management has so far been an exceptionally poor one.

The El Plomo, near Altar, is running, with what result I do not know.

In the Carbonera District, a carbonate mine was recently sold to New Yorkers for $36,000. It is worth that, if worth any thing at all.

It is rumored that a syndicate is forming to purchase and work the old mines belonging to Mr. Alsna.

Nine out of every ten American mining enterprises turn out *fiascos*, because they are got up by irresponsible parties and are poorly managed. Is Sonora, is Mexico, to blame for that?

Sonora has a hundred more mines which could be worked to advantage, if the mine-owners and the capital could be brought together, without the intermeddling of the leeches by whom the State is overrun. Change your mode of acquiring mines and working them, and you will obtain different results. Lay the blame where it belongs. J. J. M.

HERMOSILLO.

OFFICIAL STATEMENTS AND REPORTS.

HECLA CONSOLIDATED MINING COMPANY, GLENDALE, MONT.

Mr. H. Knippenberg, general manager, and the chiefs of departments of the Hecla Consolidated Mining Company, have made a clear, straightforward and full report on the affairs of the company, from which we gather the following facts: The gross profits for 1881 were $237,729.75, and for 1882, $239,564.98, a total of $477,294.74, which was applied as follows: $77,785.13 to the payment of a debt left by the former management, $180,000 in dividends, $20,307.72 for permanent improvements in 1881 and $75,621.21 in 1882, $20,800 for charcoal, $16,524.43 for wood, $3400 for iron ore, $13,014.74 for ores, $2000 for timber on hand, and $57,841.51 cash on hand over and above all indebtedness, not counting an account of the increased quantity of supplies on hand. The following is the statement of the cost of the concentrator which we described and illustrated in our issue of December 9th, 1882:

Labor	$11,387.16
Machinery, water-wheels, etc.	9,675.68
Water-pipes	5,018.13
Logs and lumber	2,208.83
Roofing	1,164.12
Nails	394.35
Sundries and services	1,005.51
	$30,853.78

Mr. Knippenberg speaks highly of the working of the plant, though as yet no figures could be submitted. Mr. James Parfet, the superintendent of the mines, reports that $85,186.72 were paid out for dead-work and permament improvements, of which $10,424.84 went toward the driving of the Lion Mountain tunnel and $20,493.44 for shafts and drifts on the Sheep Fissure, Atlantis, and Ariadne mines. He estimates that the reserves of second-class ore amount to 50,000 tons, sufficient to keep the concentrator running day and night for two years, and most of that required for one year is mined. The output in 1880 was 11,475 tons, at a cost of $14.50; in 1881, 9360 tons, costing $14.89; and in 1882, 12,192 tons, costing $13.45 per ton, including cut-off, concentrator, and construction.

Mr. George G. Earle, superintendent of the furnaces, reports that 11,345 tons of ore were reduced; and, as illustrating the importance of concentrating, he states that in this 4311 tons of silica had to be smelted. Mr. Earle furnishes an interesting table of the production and consumption of the furnaces during the year by months. The totals for the year are as follows:

PRODUCTION.

Lead, tons	2,492·00
Matte, tons	325·00
Silver in lead, ounces	512,791·90
" " matte "	34,962·25
Value of gold	$6,145·00
Pounds copper	229,708·00

CONSUMPTION.

Gross tons of ore	12,144
Net tons of ore	11,345
Iron ore	5,340
Limestone	5,328
Slag	4,782
Matte	1,164
Charcoal, bushels	685,323
Coke, tons	1,467

The quantity of fuel used was therefore 238 bushels of charcoal and 102 pounds of coke, the net ton of mixture costing $4.99, the charcoal costing 14 cents per bushel, and the coke $32.75 per ton. The average percentage of lead in the ore was 31 per cent, of silver 47·5 ounces, and of silica 38 per cent. The average assay of slags was 2·1 per cent of lead and 0·9 ounce of silver. The discrepancy in the yield of lead, apparently showing a loss of 29 per cent, is accounted for first all by loss in slag, and metal in matte, flue-dust, etc., on hand, which reduces it to 13 per cent, while there is an apparent gain in silver of 9867 ounces. The reason for this is that the principal ore smelted, that from the Cleopatra, comes in fines and lumps, the former carrying more lead and the latter more silver. In order to avoid the cost of crushing the lumps for sampling, only the fine ore was assayed, thus causing the apparent excessive loss of lead and the gain in silver. Mr. Earle also submits very interesting detailed records of the causes of stoppage of the two furnaces. According to it, during the year one furnace lost 10 days 15 hours by cleaning, 9 days 18 hours by repairs, 13½ hours by repairs to machinery, 21 days by want of fuel, and 5 hours by high water. The second furnace stopped 10 days 5 hours because it had to be cleaned, 3 days 17½ hours for repairs, 13½ hours for repairs to machinery, 9 days for want of fuel, 5 days for want of ore, and 5 hours for high water, making a total stoppage of 42 days 3½ hours for the first and 28 days 17 hours for the second.

THE LAW AS AFFECTING MINING AND METALLURGICAL INTERESTS.

Lode versus Placer Claims.—Secretary Teller has recently rendered the following decision:

I have considered the case of the War Dance claimants *vs.* the Church Placer claimants, Russell Mining District, Gilpin County, Colorado, on appeal from your decision, holding that the lode claimants are not entitled to lode or surface ground lying within the limits of the placer. The War Dance lode was located some fifteen months subsequent to the Church placer. A question of fact is presented as to whether the lode (Survey, No. 585) was known to exist within the boundaries of the placer claim at the time of the application for a patent for the placer claim. This question as to a knowledge of the existence of the lode arises upon the first official survey, made by Deputy Locke in 1876. A lode seemed to be indicated upon that plat. It was asserted subsequently, by the Deputy-Surveyor Rank, that what seemed to be a lode upon the plat of such survey, "running through the northeasterly part of the placer, appeared to be only a porphyry dike which had never been surveyed or claimed by any body." On the other hand, it was claimed that the

Digitized by Google

so-called porphyry dike and the War Dance lode were identical. Such being the state of the question, November 22d, 1881, you directed the Surveyor-General "to make the proper examination and necessary inquiries to determine the question of identity." The result of such examination, contained in the report and plat made to the Surveyor-General, February 24th, 1882, by Benjamin H. Smith, examiner, establishes the fact that such formation, designated as a porphyry dike, is distinct from the War Dance lode, and is evidently, as stated in such report, what seemed to be "the lode mentioned in the original survey of the Church placer." As the proof stands, I think it is established that the lode claim known as the War Dance was not known until more than fifteen months subsequent to the date of the entry of the Church placer claim. But, however the foregoing question of fact may be found, it is insisted by the War Dance claimants, as the law of the case, that, if the existence of a lode becomes known at any time before patent is issued for the placer claim, then the lode and the surface ground pertaining thereto must be excluded from the patent. In the late case of Becker *et al. vs.* Sears, I considered the construction which I thought ought to be given to Section 2333, United States Revised Statutes, and held that such section "carves out from a patent to a placer claim all known lodes found therein at *date of application*, together with twenty-five feet of surface ground on both sides as incident thereto." The converse of that proposition necessarily follows, namely, that where the existence of a vein or lode in a placer claim is not known at the date of the application, then the "patent for the placer claim shall convey all valuable mineral and other deposits within the boundaries thereof." Your decision, therefore, to the effect that, "as the War Dance claim was not known until long after the date of entry of the placer claim, the lode claimant is entitled to neither lode nor surface ground, within the placer limits," is affirmed.

Alkali Lands.—The following letter has been addressed to the Commissioner of the General Land-Office:

I transmit herewith letters from Hon. John P. Jones, Senator from Nevada; Hon. W. S. Rosecrans, member of Congress from California; Messrs. Whittemore and McKee, attorneys-at-law, San Francisco, Cal.; and W. W. Morrow, Esq., of Washington, D. C.; all in relation to entries of public lands in the States of California and Nevada, containing valuable deposits of borax. My attention is called to the fact that these deposits, although valuable, are not of sufficient value to permit their being entered under the mining laws, if the recent circular approved by me September 22d, 1882, and its amendment of December 9th, 1882, are applicable to entries of land containing borax and other similar valuable deposits. It was early determined by the department that the act of May 10th, 1872, which described certain lands containing valuable mineral deposits, was applicable to lands containing deposits of borax, carbonate and nitrate of soda, sulphur, alum, and asphalt; and I believe that, from the passage of the law until the present time, "valuable mineral deposits" has been held to include the minerals and alkaline substances named. I understand that borate lands have been allowed under the provisions of the act of 1872, and the regulations made in accordance therewith. It is the desire of persons interested that the regulations which were in existence having special reference to the application for patent for placer claims, namely, the circular of October 31st, 1881, should be continued in force so far as they relate to deposits of borax, etc., as mentioned above. Believing that practical effect should be given to the mining laws of the United States, I am of the opinion that, to apply the new regulations to such entries would result in excluding such lands from sale, and depriving the people of the benefit of the use of these natural deposits. I therefore direct you to permit the entry of public lands containing valuable deposits of borax, the carbonate and nitrate of soda, sulphur, alum, and asphalt in the States of California and Nevada, and the territories of Arizona, Utah, and Wyoming—in which section of the country, I am informed, these deposits are present—under the regulations of October 31st, 1881.

In addition, however, an applicant for patent for public lands containing deposits of borax, etc., as above, must affirmatively show that the lands entered are not valuable for any other purpose than the one for which application is made. It will therefore follow that the circulars of September 22d and of December 9th, 1882, are not applicable to entries of the lands thus described and excepted. Very respectfully,

HENRY M. TELLER, Secretary.

The immediate cause of the above decision originated in an intended application—under the then existing regulations—for land in Southeastern California, known as Death Valley or "desert region," which was suspended because of the amended circular referred to; the applicants not deeming it a good business transaction to go to the heavy expenses incident to proceeding to patent a large number of locations in separate applications for patents. These lands form a vast desert plain, difficult and dangerous to traverse, owing to the absence of water and to intense heat. The public surveys were extended thereto as far back as 1858 or 1859, but no sales or disposals were ever made thereof, as the lands are not habitable, and no towns or villages within hundreds of miles. The tract is simply a dreary arid waste, the dazzling appearance of which is occasionally relieved by clumps of mesquite bushes. The places where these alkalies are found are much scattered, and have the appearance of beds of ancient lakes long since dried up. Pools of bitter water are still standing at some points, gradually undergoing the process of evaporation, leaving the alkali deposits incrusted on the sides or bottom. The construction of reduction-works, the making of roads, bringing the necessary water, and other improvements, involve an immense expense before any returns can be received. This decision is not only in accordance with former instructions—before the circulars named were issued—but also accords with the decision of the United States Supreme Court in the case of the St. Louis Smelting and Refining Company *vs.* Thomas. Simplified, the above decision is, that lands containing deposits of borax, carbonate or nitrate of soda, sulphur, alum, and asphalt, if not valuable for any other purpose, are not confined to entry under the mineral law, but are subject to disposal under the general laws governing the disposal of the public domain. It is not many years since nearly all of the salts of the kind now found in the great Western desert plateau were imported from distant foreign countries—notably Peru and Persia. The Duponts, powder manufacturers, were about the first, if not the first, to utilize these deposits by buying a large tract of land in Nevada, from the government, at the nominal sum of $1.25 per acre.

THE BILL FOR THE TAXATION OF MINES IN COLORADO.

A bill for an act to enable the county commissioners to assess and collect a tax upon the net proceeds of mines.

Be it enacted by the General Assembly of the State of Colorado:

SECTION 1. All ore and mineral-bearing material of whatever character, when broken, not in the mine, vein, ledge, or deposit, or broken and raised to the surface, shall be assessed for the purpose of taxation in the manner following, to wit:

First. From the gross yield returned or value of all such ores or mineral-bearing material, of whatever character, there shall be deducted the actual cost of extracting such ores as mineral from the mine, the actual cost of transportation of such ores or mineral-bearing material to the place of reduction or sale, and the actual cost of such reduction or sale, and all other actual and necessary costs of mining, shipping, and all necessary expenses attendant upon the prospecting, working, and development of said mines, and reducing such ores or mineral-bearing material; and the remainder thereof shall be assessed and taxed as provided for in this act.

SEC. 2. It shall be the duty of the several county assessors within this State to compile and complete, on or before the 25th day of June in each year, a tax-list or assessment-roll of the proceeds of all mines in their counties, arranged in a book to be furnished by the board of county commissioners for that purpose, in which book shall be listed and assessed the proceeds of all mines in their respective counties, as provided for in this act. It shall also be the duty of the assessor of each county, on or before the first day of May in each year, to deliver to every person or firm, owner or lessee, superintendent, treasurer, managing director, or agent of any corporation, association, firm, or company, owning or operating any mine or mines in his county, a written or printed notice, requiring him to make out and return to the assessor, at a time and place therein specified, a statement or list of all ores or mineral-bearing material extracted from such mine or mines during the year ending on the said first day of May, and the number of tons of such ores or mineral-bearing material treated, reduced, or sold during the same period, together with the amount of the gross yield of such ores or mineral-bearing material, and the cost of breaking, raising, transportation, and reduction of the same; *provided*, that in the statements or lists of gold-bearing ores treated by the stamp-mill process, the return may be of the gross yield of all ores treated by such stamp-mill process, together with the cost of mining, transportation, and reduction of the same. The said assessor shall furnish to each of such parties as above mentioned a blank, upon which such statement or list may be made, which blank shall be provided by the county commissioners, and shall be in the following form, to wit:

Name of mine.	Description of location of mine.	Name of owner, company, etc.	No. of tons extracted for the year ending May 1.	No. of tons treated, reduced, or sold during same period	Amount of gross yield of such ores.	Cost of breaking and raising.	Cost of transportation.	Cost of reduction.	Net proceeds.

SEC. 3. It shall be the duty of the owner or owners of any mine or mines yielding or producing any ore or mineral-bearing material, whenever such ore or mineral-bearing material yielded or produced during the year ending on the 1st day of May next preceding shall amount to the sum of $50 or more, reckoned as in Section 1 of this act, to make out, sign, and swear to, and deliver to the assessor a report of the amount and assessable value of such ores or other mineral-bearing material, which report or list of such amount shall be in form as provided in Section 2 of this act. In all cases where mines are worked by incorporated companies, joint-stock associations, mining or other partnerships, the general manager, superintendent, or agent having the control of the operations of such mine, shall be held to be the person whose duty it is to make such annual reports.

SEC. 4. The lessees of any mine producing or yielding any ore or mineral-bearing material that may be liable to assessment under the provisions of this act shall be held and deemed the owners of such property for he purpose of making such annual returns of all such assessable material as shall be produced or yielded during the term of their lease, and shall be held liable the same as though they were the owners of such property.

SEC. 5. In case of the neglect or refusal of the person, or firm, owner, or lessee, president, superintendent, treasurer, managing director, or agent of any corporation, association, firm, or company to give, under oath or affirmation, the statement required in Section 2 of this act, on or before the 20th day of May, in each and every year, the assessor, or his deputy, may make an estimate, from the best sources within his reach, of the number of tons and the value per ton of all ores, quartz, or other mineral-bearing material extracted by such person, firm, owner, lessee, corporation, association, or company during the next preceding year, and assess the same to them, and such assessment shall be as binding, lawful, and effectual as if made upon a sworn or affirmed statement.

SEC. 6. Any person, or firm, owner, or lessee, superintendent, treasurer, managing director, or agent of any corporation, association, firm, or company owning or operating any mine or mines yielding or producing any ores or mineral-bearing material subject to taxation, and required by this act to list the same, as provided in Section 2, and with whom the assessor shall have left a notice requiring him to make out a

Digitized by Google

statement of such property for taxation, who shall fail, neglect, or refuse to do so as herein required, or who shall return a statement known to be erroneous or defective, either as to the description or value of the ores or material listed therein, or who shall willfully make or fail to make in such list any statement whatever, whereby he shall avoid any assessment of taxes proper to be made against him, shall be subject to a penalty of not less than five hundred nor more than two thousand dollars, to be recovered by the county commissioners, for the use of the county, in any court of competent jurisdiction; and it shall be the duty of any assessor or treasurer having knowledge of a violation of the provisions of this section to report the same to the district-attorney.

SEC. 7. If any person shall willfully make or give under oath or affirmation to the assessor a false statement, either as to the description or value of the ores or material listed therein, or as to the net proceeds of the same, such person shall be deemed guilty of perjury, and, upon conviction thereof, shall be punished therefor as is by law provided for the punishment of perjury.

SEC. 8. Every tax levied under the authority or provision of this act on the proceeds of the mines is hereby made a lien on the mine or mining claim from which such ores or mineral-bearing material have been extracted, which lien shall attach on the first day of May of each year, and shall not be satisfied or relieved until the taxes levied on the proceeds of such mine are all paid, or the title of such mine or mining claim is absolutely vested in a purchaser under a sale for taxes levied on the proceeds of such mine or mining claim.

SEC. 9. The collection of the tax authorized to be levied under this act shall be enforced in the same manner in which the tax on personal property is enforced and collected under the acts relating to revenue now or hereafter in force; and in case no sufficient personal property can be found by the collector of taxes, out of which such taxes can be made, the same may be collected by the sale of the mine or mining claim upon which such tax may have become a lien, in the same manner provided for in the act relating to revenue for the collection of taxes due on real estate; and the purchaser at any sale of any such mine or mining claim so made shall be entitled to a deed for such property, or such portion as may have been sold at any tax sale, at the same time and on the same conditions as purchasers of other real property at tax sale.

SEC. 10. In all sales of any mine or mining claim for such taxes, such sale shall be held and deemed to be of the interest which the owner has therein, whether the same be in fee or the possession, right of occupation and enjoyment of such property, and shall not in any manner interfere with the right of the government of the United States to any property title to which remains in the government.

SEC. 11. The net proceeds of all mines shall be assessed and taxed in the county wherein the mine or mines are located.

SEC. 12. The assessment, levy, and collection of all taxes under this act shall be made in the same manner as all other taxes are assessed, levied, and collected under the laws now in force in this State, except as otherwise provided for in this act.

Emergency Clause—*Whereas*, In the opinion of the General Assembly an emergency exists, this act shall become law immediately upon its passage.

THE BOSS "CONTINUOUS SYSTEM" OF PAN AMALGAMATION.

In crushing wet, water is brought into contact with the ore during the act of pulverizing, which facilitates its discharge through the screen, and consequently crushing, when done by stamps, is less restricted. The finely-pulverized ore passes the screen in the form of muddy water, which by universal custom has been run into tanks or vats to settle. When a tank has settled full of sand, it is shoveled out, the sand or pulp being deposited in front of the row of pans. When a pan is ready for a charge, the sand is shoveled into it, adding water to obtain the desired consistency. At the proper time, quicksilver is added, to absorb the precious metals, or, in other words, to amalgamate them. The pan has a revolving muller which stirs and circulates the contents, producing contact among the particles of pulp and quicksilver. A charge is usually treated from four to six hours, when, by drawing a plug at the bottom of the pan, the entire contents are run into a settler. The latter in some respects resembles a pan, but is larger, and the revolving of the muller is slower. In this settler more water is added, the object being to precipitate all the quicksilver, but none of the sand. After running for a time, the quicksilver carrying the precious metals is drawn from the bottom of the settler, and the charge runs off through a plug-hole a few inches above the bottom. The shoveling of mud from the tanks, distributing it in front of the pans, and shoveling it again to charge the pans, involve much labor. The pans and settlers also require much attention. There is more or less wastage of ore from the tanks, mud being spread everywhere inside and outside the mill. In running off the settlers, more or less quicksilver is flooded away.

When crushing dry, the ore is first dried by heat, and the ore, when finely pulverized, passes the screen in the form of dust instead of mud. The dust passes the screen much more slowly than the wet ore, consequently the amount of work is much less. For this reason, dry crushing is generally confined to such base ores as require roasting. The pan treatment is similar in both cases; but less labor is involved in handling the dry ores than the wet.

Two years ago last May, Mr. P. Boss, a well-known milling engineer, of San Francisco, took up the plan of what he styles "continuous" working, at the Noonday mill, of Bodie, Cal. Referring to the illustration, he describes his "Continuous System" as follows:

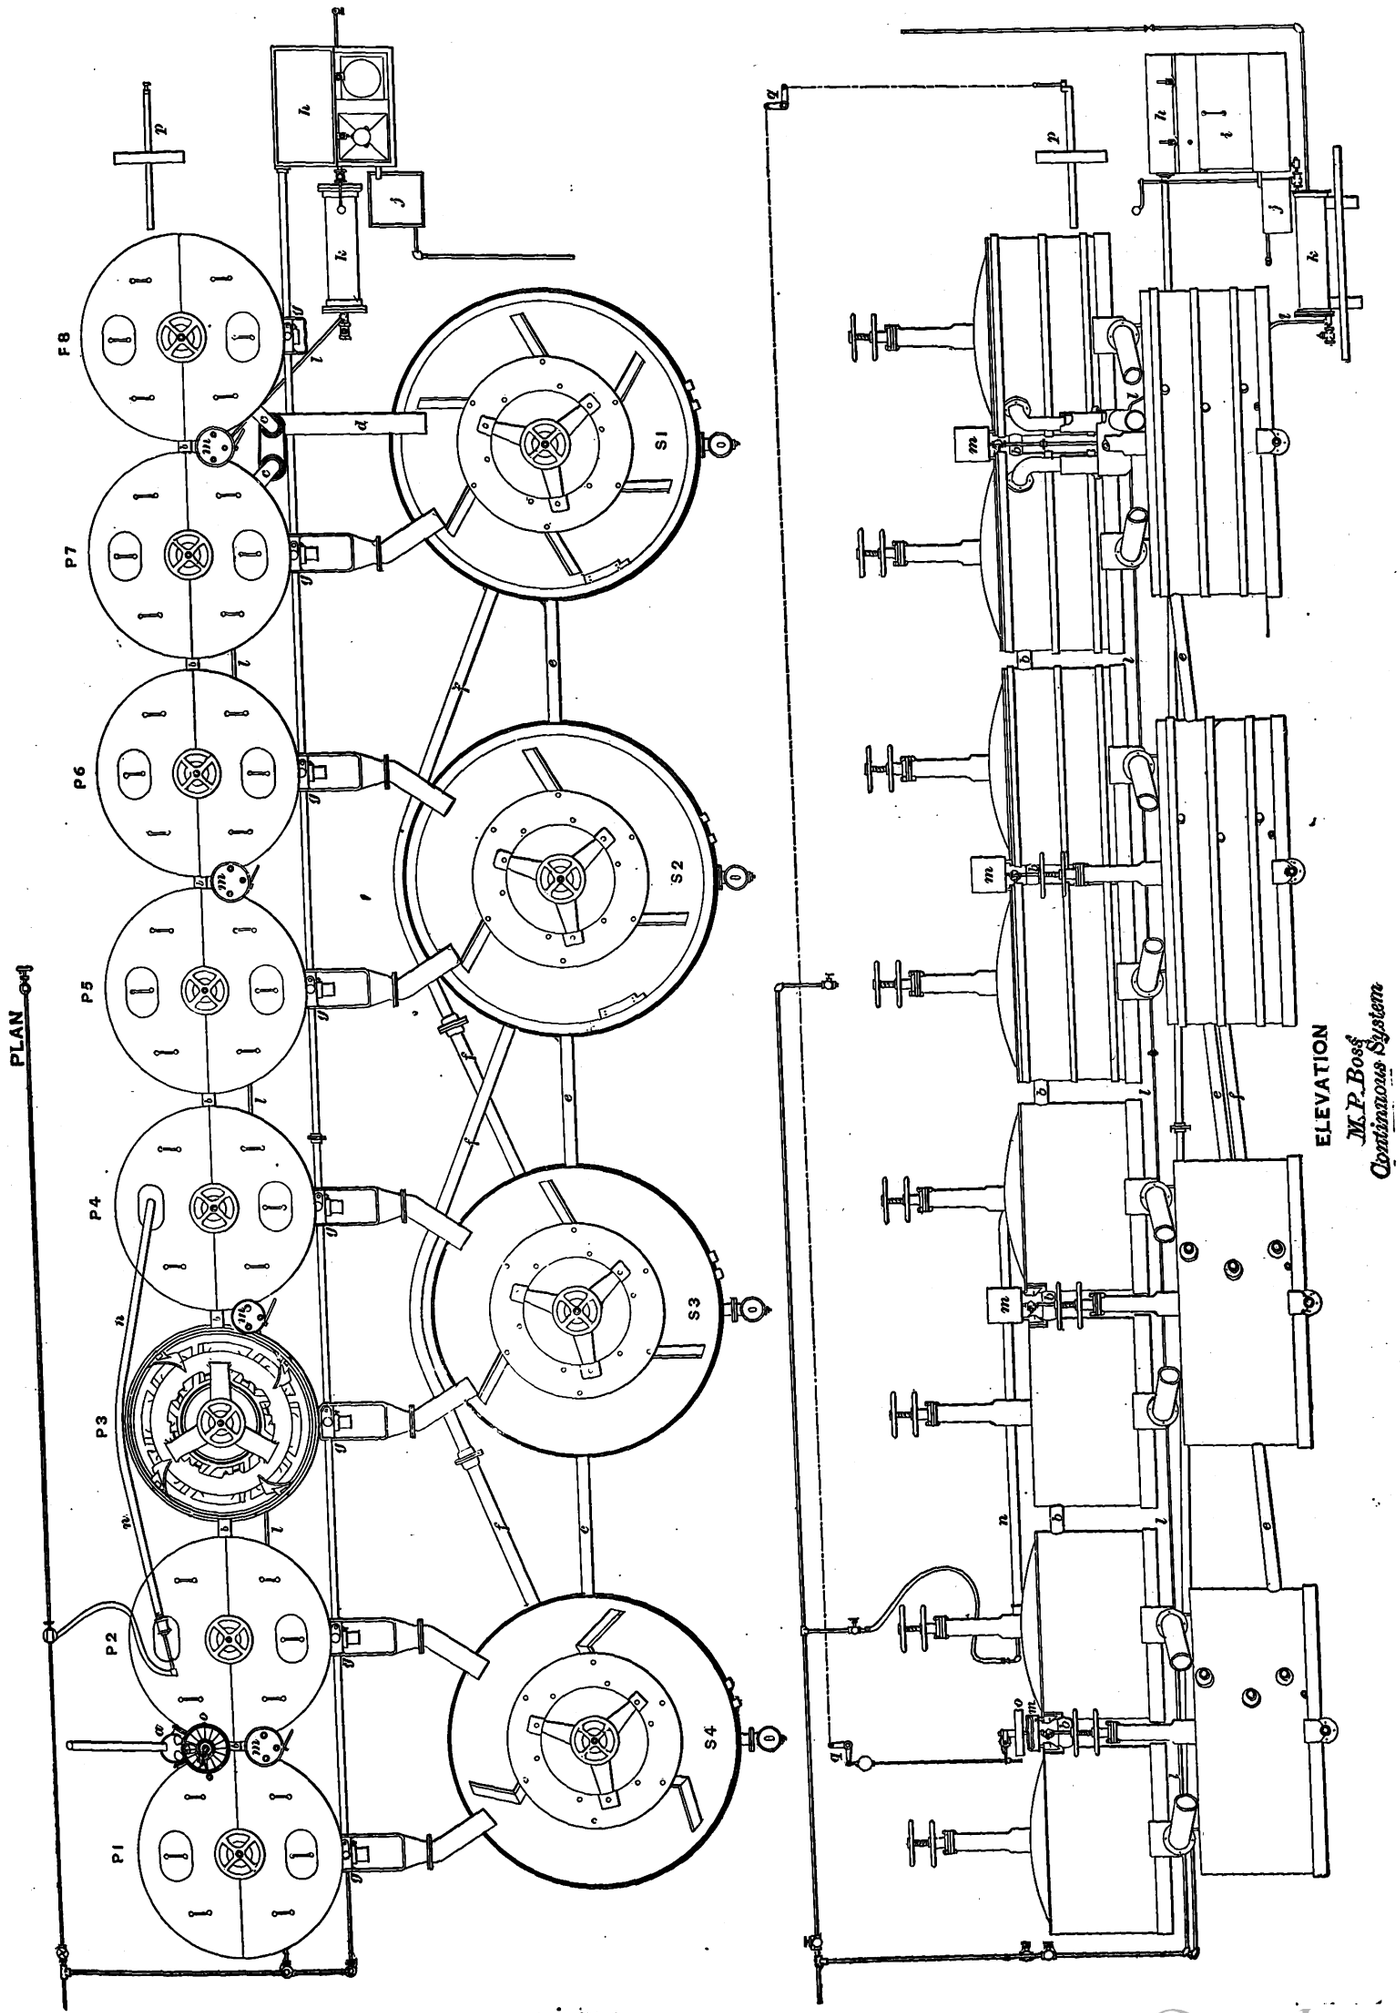
The pulp, when wet-crushed, is run from the battery through a pipe to a receiving or sampling-bowl *a*. If the pulp is roasted, or dry, it is brought to this bowl by a screw or other conveyer. This bowl *a* is connected with and has a discharge into each of the first two pans, Nos. P' and P^2. Ordinarily the opening to No. 2 is plugged, and all the pulp runs into No. 1. When No. 1 is once filled, it overflows constantly into pan 2, through a pipe *b* connecting them. In the same manner, pan No. 2 overflows into No. 3, No. 3 into No. 4, etc., throughout the series. These connecting-pipes *b* are all about seven inches from the top of the pans. Each of the last two pans of the series has an overflow-pipe *c*, leading into the settler S^1, but ordinarily the last one only is used. The system is so arranged that any pan can be "hung up" or cut out of the system. In case No. 1 needs repairs, the pulp is run directly from the battery into No. 2. If the last of the series is disabled, the next preceding is made to overflow directly into the settler. Any intermediate pan may be cut out by using the steam siphon *n* to carry the pulp around. A quicksilver bowl *g* is attached to each pan, by which the quicksilver can be drawn at any time, which is done by pulling a plug to a pipe leading to the strainers. As soon as all is run out, fresh is let in from the charging-bowl *m*. This charging may be done as often as desired. The pulp flows through the settlers in a manner similar to the pans; but the connecting-pipes *e* are on an incline, and there are stationary pipes *f* to carry the pulp around when one is cut out. From the last settler the tailings flow away.

It will be perceived that, by this method, there is no handling of the pulp whatever; that the ore comes in contact with fresh quicksilver several times in its course; that all quicksilver that escapes must flow through all the settlers; and that there can be no flooding, there being a constant, easy current. It will also be seen that the actual principle of amalgamation is the same whether by charge or by the continuous system. In either case, the pan produces contact of pulp and quicksilver, the result of which is amalgamation. It is not claimed that its action inside the pan differs materially from the old charge system. They are virtually one and the same process, the "Continuous" having some advantage from its frequent change of quicksilver. A fault in the action of the pans or settlers which may not be glaring by the old way is ruinous by the new; for it is a fundamental principle that concentrations must not accumulate in either; also, that in the pan the quicksilver must circulate vigorously throughout. There is no ore so light but that a correct pan can circulate the quicksilver through it. There is no ore so heavy but that pan and settler can be made to circulate it without concentrating.

Some trouble was at first experienced in this direction in the Sierra Grande twenty-stamp mill, Lake Valley, New Mexico, where a twenty-stamp mill was built on the Boss plan. The mill was hurriedly finished, and low wages hired only poor and inexperienced hands. At first, the settlers would accumulate concentrations and stop; but this trouble was overcome, and a test made by Mr. E. D. Town, superintendent of the mill, against the old way, showed that a higher percentage of silver was obtained with good ore, that the loss of quicksilver was less, and that a smaller amount of water was used. On certain ores, the yield was not satisfactory; but this is, very probably, due to the high percentage of manganese in some of them. An analysis of the tailings for five months showed 39 per cent of oxide of iron, 27 per cent of oxide of manganese, 5 per cent of lead, 6 per cent of lime, and 23 per cent of silver.

It has been argued by some that, as with some ores, the pulp would carry only one half as much sand as in ordinary working, it would be necessary to have twice as many pans in order to subject the ore to the same number of hours of treatment. But experience so far shows that all the time is made up by the rapid currents of the thin pulp, and that the same number of pans, by the continuous system, will treat as much ore in a given time.

The Boss system has been thus far introduced at the Noonday, Bodie; the Harshaw, Arizona; the Lake Valley, New Mexico; and the Prietas, Sonora, mills.



The Noonday was a thirty-stamp mill, afterward increased to forty stamps, and had twenty-four pans. The system has given complete satisfaction for more than two years and a half, giving a rather better percentage. The loss of quicksilver was reduced from an average of one and a quarter pounds to .67 of a pound per ton of ore. The pay-roll was reduced forty-four dollars per day. In the Harshaw mill, the capacity was increased and the percentage of yield improved by one and four tenths by assay average. At the Prietas forty-stamp mill, where the ores were very heavy, more than three fifths of the time the tailings showed merely a trace of gold, being too small to weigh. At the Noonday, the Harshaw, and the Lake Valley, severe tests were made, extending over a period of weeks, of the continuous against tanks, since when none of them has used tanks.

THE HOWE CULM GRATE.

The Scranton *Republican* has the following notice of the Howe patent grate for using culm, which has been in use at the Lackawanna Iron and Coal Company's works: It works with two levers, and in two minutes' time a laborer can clean all the ashes and clinkers from a furnace which, with the old process of using a poker, would take him half an hour to perform. It is a great fuel-saving invention, because, in furnaces where it is placed, culm can be burned instead of large coal. Culm will come into general use in course of time in consequence of this important invention. Mr. B. Niebell, engineer of the Lackawanna Iron and Coal Company, says that, as soon as the company puts the grate into all of the furnaces, it can do away with one boiler from each nest. Culm makes more steam than coal when used in furnaces having this patent grate, because neither time nor steam is lost in cleaning the furnaces of clinkers and slate. With this grate, the boilers are making steam constantly, and are not cooled off, as they were formerly, when the doors were opened to clean the fires. The device is very simple in its construction, and can be taken from the foundry and put into the furnace without any fitting. It acts somewhat on the principle of a pair of shears, the grate being one blade and the knife-edged oscillating bars the other blade. When the handles are pushed from the operator, the fires are loosened up; and when the handles are pulled back, the blades cut the clinkers.

THE Denver & Rio Grande Western Railroad has been carrying coal from the mines of the company at Pleasant Valley into Salt Lake City since the first of the year, and has entered into sharp competition with the Union Pacific Company, which has sold its coal from Knox Springs and Webber in Salt Lake City. The prices of coal under this competition were reduced from $8 to $5.25 per ton in car-load lots at Salt Lake City on January 15th. The Pleasant Valley coal is of superior quality, and is preferred by manufacturers to other coals obtainable.

THE PRODUCTION OF PIG-IRON IN 1882.

Mr. James M. Swank, Secretary of the American Iron and Steel Association, announces the actual production of pig-iron in this country in 1882. In that year, our blast-furnaces produced 5,178,122 net tons, or 4,623,323 gross tons, of pig-iron. In 1881, the production was 4,641,564 net tons, or 4,144,254 gross tons. The increase in 1882 over 1881 was 536,558 net tons, or 479,069 gross tons, which is over 11 per cent. The following table gives the production of anthracite, charcoal, and bituminous pig-iron in 1882, compared with 1881 ·

Kinds of fuel.	Tons of 2000 pounds. 1882.	1881.
Bituminous	2,438,078	2,268,264
Anthracite	2,042,138	1,734,462
Charcoal	697,906	638,838
Total	5,178,122	4,641,564

The production of 1882 exceeded that of any previous year in every respect. More bituminous pig-iron, more anthracite pig-iron, or more charcoal pig-iron was made than was ever produced in any one year before.

The stock of unsold pig-iron in makers' ha ; at the close of 1882 was over twice as large as that at the close of 188.. The stock at both periods is shown in the following table :

Kinds of fuel.	Tons of 2000 pounds. 1882.	1881.
Bituminous	157,196	36,495
Anthracite	107,259	90,351
Charcoal	165,239	84,050
Total	429,694	210,896

The stock of both bituminous and anthracite pig-iron on hand at the close of 1882 is thus seen to have been light, but that of charcoal pig-iron was very heavy, amounting to almost one fourth of the production for the year of that kind of iron.

As our imports of foreign pig-iron in 1882 amounted to about 540,000 gross tons, and the producers of pig-iron had 188,300 gross tons on hand unsold at the beginning of 1882, as compared with 383,655 tons at the close of the year, our probable consumption of pig-iron in 1882 was about 4,967,968 gross tons, against a probable consumption of 4,982,565 tons in 1881.

The condition of the furnaces of the United States on January 1st of the present year is shown in the following table, as compared with their condition one year previous :

Date.	Completed furnaces.	In blast.	Out of blast.
January 1st, 1883	687	417	270
January 1st, 1882	701	446	255

THE COPPER DEPOSITS OF ADAMS COUNTY, PENNSYLVANIA.

Written for the Engineering and Mining Journal by J. Trowbridge Bailey, M.E.

The results arising from recent developments in the copper fields of Adams County, Pa., have caused such enterprise and interest to be manifested, as to induce considerable amount of capital to seek investments in this locality for purposes of investigation and exploration. I have quite recently had occasion to visit and examine the deposits in question, and some information regarding them I think likely to prove of interest. A number of companies have been organized for the purpose of developing and working the deposits, and the results of these undertakings have from time to time formed the topic of discussion in several local journals. Prominent among the enterprises of this nature are the Harrisburg Copper Mining and Smelting Company, the Headlight Copper Company, and the South Mountain Copper Mining Company. The two first mentioned are at present in active operation ; the work upon the latter company's property, however, has for some reason been discontinued.

The fact that copper has existed in quantities sufficient to prove commercially valuable in our Eastern sedimentary and primary formations has been known for many years. From Nova Scotia to Georgia, the deposits have been worked and remuneratively so in many sections of the Appalachian Mountains, both upon their eastern and western slopes. The deposits discussed below are located in that portion of the great Eastern mineral belt lying within the counties of Adams and Franklin in Pennsylvania and Frederick and Washington in Maryland, or more specifically, the mineralized zone is confined to the several ranges and spurs of South Mountain within a radius of twenty-five or thirty miles of the intersection of these county-lines with Mason & Dixon's line. South Mountain forms in Maryland the division line between Washington and Frederick counties. Crossing the State line at Blue Ridge station, on the Western Maryland Railroad, it passes into Pennsylvania following closely in a northeasterly direction the county-line between Franklin and Cumberland counties upon the north and Adams and York counties upon the south. Over this entire territory are more or less indications of copper, but the most active explorations have taken place in the localities more especially referred to above. The Western Maryland Railroad crosses the belt at Blue Ridge station upon its way to Baltimore toward the south, and toward Harrisburg northward. The mountains in all parts, but particularly in the vicinity of present developments, are ramified with roads and ways.

Geological Features.—It would be difficult to do justice to the geology of this section without first making a most careful and detailed examination of the country, accompanied with more extensive and well-directed developments. From my comparatively cursory examination, which extended over a territory probably fifteen miles in extent, and comprising all the developments of any moment which have thus far taken place, I comprehend the lithology as follows: Upon the west and north of South Mountain in the Cumberland Valley, we find a hard, compact crystalline limestone, lying in a comparatively undisturbed state. This valley lies between two upheavals; namely, the South Mountain upon the south, and the North Mountain upon the north. The underlying crystalline schists, composed of a coarse sandstone conglomerate, chloritic and metamorphic schists of all kinds, have been greatly dislocated and turned upward by the disturbances caused by the formation of South Mountain, and by denudation have been exposed to view upon both its slopes. Except where infiltration has taken place, however, the stratified formations are entirely devoid of copper-bearing minerals.

Breaking through the stratified formation and following in its strike the apex or general trend of the range, is a zone or dike of quartzitic epidote. This volcanic intruder contains the cupriferous minerals or deposits. In some localities, the line of demarkation or contact between the chlorite which apparently forms the country-rock and the epidote is very distinct, but in general the disturbance has been considerable, and the adjoining rocks are dislocated and ruptured. Present in all directions, and highly metamorphosed, are amphibole, chlorite, and the manifold decomposition products of epidote. The exact manner of the primary occurrence of the copper is to my mind as an accessory constituent of the volcanic epidote. It is present principally native, but in some degree as oxide and sulphide. The latter forms are undoubtedly, however, present through oxidation or changes from the former. Where aqueous and atmospheric agencies have had sway, of course the carbonates are present. Where opportunity presented itself, as in cracks, cleavage faces, cavities, or geodes, a segregating action has taken place, concentrating the metal into wonderfully rich accumulations, as is markedly the case at Mussulman Hill, the Headlight Company's properties, and in lesser degree at other localities. As a rule, any piece of epidote in this locality will be found more or less impregnated with copper, usually in very fine grains homogeneously distributed. There is little doubt in my mind that the metalliferous deposits or zone of impregnation do not extend beyond the truly volcanic formation, except where infiltration into the adjoining rocks has taken place. It is possible that the serpentine is present, filling a previously existing fissure in the crystalline schists. The only instances of a similar deposition that I know of occur at Monte Catini in Italy. Here the schistose or sedimentary strata are broken through and much metamorphosed by serpentine. The mineral is present in fissures formed in the serpentine, and increases qualitatively and quantitatively with depth. The ores occur scattered through the serpentine rock, and consist of sulphides and native copper. They form small nodular masses, or even large ones of several feet in extent and cubical contents, and increase in number with depth. Similar lodes occur at Rocca Tederighi, where the serpentine occurs between quartz-porphyry country-rock. The veins increase in richness with depth. Serpentine occurs in numerous localities, and appears to be generally a carrier of copper ores.*

The developments which have thus far been carried on upon the portion of the mineral belt are very meager, superficial, and mostly misdirected. Beginning at the southern portion of the district, we find considerable territory held by the Harrisburg Copper Mining and Smelting Company. Upon the George Warner tract, several shafts from ten to fifteen feet in depth have been sunk in the shales and schistose quartzite, evidently some distance from the serpentine deposit, which has not yet been definitely located. The schists contain copper in very small percentages, present as carbonate and only through infiltration. The laminæ strike north 45 degrees to 50 degrees east (mag.) and dip north and east at an angle of 75 degrees. The second development takes place at shaft No. 2 on the Brown tract about one mile north of the Warner tract. Here a shaft ten feet deep has been sunk in the chloritic country-rock, and affords naturally no indications of any moment of copper, being remote from the true deposit. Shaft No. 3 is one mile north of No. 2. It is down 50 feet in a mixture of epidote and chlorite, which appears to be very much disturbed. At 40 feet, a small vein of oxide and native copper was struck, dipping into the hill ; but instead of following this, the work was discontinued, and, at the time of my examination, the shaft was filled with water.

Several miles north of these developments is the Wagamon farm. No development has been prosecuted here, but excellent surface indications are present, of native copper and oxide of copper, plentifully disseminated in a fine quartzitic epidote. I took specimens from an area of four or five acres, and find them all to be highly impregnated with native metal. One boulder in particular attracted my attention. It weighed probably half a ton, and was completely peppered with native copper and oxide of copper. The country-rock is a chlorite. At any point between these developments, surface indications are present in a high degree.

The mineralized epidote or serpentine zone extends over Mason & Dixon's line, at Blue Ridge station, into Pennsylvania. The first developments of any account in this State have been prosecuted on the property of the Headlight Copper Company. Considerable excitement exists at present over the recent strikes in these workings. A tunnel has been driven in 70 or 80 feet at, or nearly at, right angles to the strike of the deposits. At a distance of about sixty feet, a region of impregnation was encountered. This chimney or chute was cut by the tunnel obliquely, and showed an area of probably 24 square feet. The manner of deposition of the copper was a uniform dissemination to the amount of from 10 per cent to 20 per cent for five feet, but dissipating itself gradually upon all sides into the epidotic rock. The latest advices give account of a second strike, farther on. This, in my opinion, is likely to be of more importance than the first one, being nearer the main body, of which abundant indications are present upon the surface.

Adjoining the Headlight Copper Company's property are, successively, the Pittinger, Gladhill, Shingledecker, Balsley, and Bingham tracts. Upon the latter is a shaft 40 feet deep, and the remains of an old furnace. The shaft is sunk in quartzite, but is at present filled with water. This work was done some fifty or sixty years ago, the furnace being operated to treat the ore taken from the shaft. Upon the dump of the old furnace are to be seen fine bodies of ore from these developments. There appear to be three distinct veins upon this hill, and float consisting of native copper to the amount of four or five tons has been shipped to Phœnixville.

A stretch of four or five miles separates this from the next point of development, which is located on the Russell tract, and belongs to the South Mountain Copper Company. A shaft 120 feet deep has been sunk. It was closed at the time of my visit, and I could ascertain but little regarding it. Several tons of low-grade copper ore were upon the dump. It is not unlikely that the work has been injudiciously placed.

At Culp Hill, several miles north of this, a shaft 22 feet deep has been sunk between two apparent chlorite walls ; some fine ore has been extracted. I have some magnificent specimens of native copper collected at this shaft. I am in great doubt whether the point selected is the

* Von Cotta's *Ore-Deposits.*

Digitized by Google

proper one. The apparent walls are due to a slip or fault of the country chlorite, and copper has been deposited by precipitation from infiltration. It would be wise to direct developments in other portions of the hill, with a view to determine more definitely the location of the deposit.

The last and most important developments are located upon Mussulman Hill, one mile north of Culp Hill. Here a shaft is down 30 feet, and some of the finest ore I have ever seen has been extracted. In approaching the apex of the hill along the strike of the deposit, the surface of the ground is literally covered with wonderfully rich native float, pieces weighing a ton or more sticking full of native copper and oxide of copper being visible. One piece of native metal weighing 27 pounds was picked up by Dr. Snively, the former lessee of the property, within a few feet of the shaft. There are not less than fifty tons of good marketable ore lying in the vicinity of the shaft. Active work has been commenced since my visit to the property.

The zone of impregnation or eruption preserves a wonderfully uniform strike and degree of mineralization throughout Pennsylvania, and is confined, so far as my examination took place, to Adams County. The geology of Mussulman Hill is plainly visible in driving along its base. The mineral-bearing zone of eruptive rock is plainly marked along its strike by *detritus* consisting of large and small boulders of highly metamorphosed quartzitic epidote. Immediately upon the epidote lies the stratum of chlorite, inclined at an angle of about 35 degrees. Upon this follow successively strata of talcose schists, quartzite, and argillaceous shale, and this is the general lithological sequence, preserved with local variations along the entire belt.

So little well-directed and intelligent development has been prosecuted upon these deposits that it is impossible to form any definite idea of their true character and consequent value. The results of the present active operations have been much more satisfactory than any hitherto undertaken, and should their ultimate issue prove successful, it will not occasion me any surprise. The ore when encountered *en masse*, as at Mussulman Hill, is exceptionally rich, consisting almost entirely of native metal which can be treated at a mere nominal figure. It is almost impossible to obtain a reasonably accurate determination of the ore, owing to the presence of so much native copper. Assays from Mussulman Hill give a return of from 15 to 45 per cent of copper; from the Headlight property, from 2 to 20 per cent; and at different points along the belt, the float distributed over the surface assays from 1 to 10 per cent Cu. Where such enormous masses of rich surface float exist, it is reasonable to suppose that deposits of magnitude are present. Indications of this nature in other portions of the world would create great enterprise and solicit intelligent expenditures of moneys in demonstrating their worth and importance.

There is one very important point to be considered in relation to these deposits, which has a direct bearing upon their economic value; namely, their character, or the manner of occurrence in which we may expect to find the mineral in future explorations. It is an exceedingly difficult matter, considering the meager data at hand furnished by development, to know in what class of mineral deposits they may be placed. Although the locality has been frequently the subject of reports by a number of engineers, other than a mere casual reference has never been made to these geological characteristics. One prominent engineer is of the opinion that the mineral is deposited in fissure-veins. Especially did he consider that to be the case at Culp and Mussulman hills. At these two points the idea has probably been derived from the fact, already stated, that the developments, consisting of two shafts, have been made between two comparatively smooth chloritic walls. The character of the material inclosed between these two walls, however, precludes any possibility of its being a fissure in the generally accepted sense. The vein-matter is composed of a metamorphosed quartzitic chlorite, highly laminated, with the laminæ inclined at an angle of about 80 degrees to the walls, being cut abruptly by them without affording at the point of contact any signs of clayey decomposition or other features so characteristic of fissures. It presents all the appearances of being a fault or slip in the country chlorite. This dislocation has afforded opportunity in a limited degree for the more ready passage of waters containing in solution copper, lixiviated probably from the epidote. I have failed to observe in any locality in this immediate section any definite form of deposition. Certainly, no true fissure-veins are present. I am inclined to the opinion that the volcanic epidote is present, filling a previously existing fissure, or possibly the eruption causing the fissures and the matter contained in them are of the same age. By contraction in cooling, or through the action of waters, local cavities have been produced which have subsequently been mineralized by the percolation of fluids holding the copper in solution, and causing it to be concentrated into local segregation or deposits. The developments in the tunnel of the Headlight Company's property seem to substantiate such a view.

In the southern extensions of this mineral zone, the sedimentary formations of Maryland, Virginia, and North Carolina contain copper—not unlikely of the same primitive origin as that under discussion—filling cracks, fissures, or interstratified with the shales, sandstones, and limestones. I recall an instance of a true fissure in North Carolina, possessing a hanging-wall of precisely the same epidote as that found in Adams County, the foot-wall being composed of the schistose formations already spoken of. This vein was traceable for over three miles, and is excessively well mineralized, undoubtedly by its contiguity to the epidote, which, like that in Adams County, is homogeneously impregnated with native metal. The feature best calculated to insure desirable results, namely, the "permanency of the mineral," can of course only be established by possessing an accurate knowledge of its manner of deposition. If a secondary era of eruption has caused sub-fissures or veins to be formed either entirely in the serpentine or breaking through and across the mineral-bearing zone, similar to that cited in North Carolina, they will be found to possess great richness and permanency. Should, however, the changes be confined to the mere local causes already referred to, exploitations will be accompanied with great uncertainty of results. Until more extensive investigations have been carried on, this point is apt to remain a problematic one.

A NEW catalogue has been issued by the Morey & Sperry Mining Machinery Company, of 92 and 94 Liberty street, this city.

JOHN G. BUCHAN HEPBURN.

Recent telegraphic dispatches from Mexico bring the painful announcement of the death of John G. Buchan Hepburn, who was murdered by riotous miners at Pinos Altos, Chihuahua, on Sunday, February 4th. Only a few details of the lamentable occurrence have been received; but from these it appears that on Sunday afternoon a large party of troublesome and dissolute men made a violent attack upon the store of the Pinos Altos Company, in resisting which an employé of the company was killed. Mr. Hepburn, the principal owner and manager of the mine, went into the store to quiet the tumult, addressing the rioters in conciliatory language, but was himself shot and instantly killed.

The unfortunate victim of this deplorable ruffianism was a gentleman whose early and tragic death will be deeply mourned by many friends in this as well as in his native country. Mr. Hepburn was an Englishman, born in 1841, the son of Sir Thomas Buchan Hepburn, who was recently a member of Parliament for Haddingtonshire. Like many other young English gentlemen, Hepburn came to the United States, about eight or ten years ago, to seek in the far West a career in which the possibilities of acquiring fortune might be combined with those attractions of an outdoor life in a new country with which men sometimes like to vary the monotony of civilization. He first engaged in sheep-raising in Oregon or Northern California, but, not finding that profitable, soon turned his attention to gold quartz-mining, first near Hornitos, in Mariposa County, California, and subsequently at Black's, near the Yosemite Valley, both of which enterprises were failures. Disappointed but not disheartened, he went, in 1877, to Mexico to look for something new, and, after some months of searching, finally made a contract for the purchase of the Pinos Altos mine. To the development of the new enterprise he devoted himself with great industry and perseverance, and a very large amount of capital, some seven hundred thousand dollars, it is said, much of the latter being furnished by his family and friends at home, who had an abiding faith in his ultimate success. It was only within the past year or two that their hopes had begun to be realized. For some time past, the mine has been in bonanza, making a large monthly product and profit. Recent reports were, in effect, that the capital invested was being rapidly repaid; and it was Mr. Hepburn's expectation to return home during the coming year with his hopes and wishes fulfilled. It is indeed hard that after years of self-exile and persistent work he should, at last, have met such an unhappy end just as the success for which he had so long been striving was within his grasp. Mr. Hepburn was a man of peculiarly amiable disposition and attractive manner; and those who knew him here, though slightly, will long remember him with a tender regret and a deep sympathy for the family and friends who mourn his loss at home.

PROGRESS IN SCIENCE AND THE ARTS.

Premium for a Perfect Safety-Lamp.—Mr. Ellis Lever, Culcheth Hall, Bowdon, England, has agreed to hand over to the Central Board of the Miners' National Union the sum of £500, to be paid as a premium to any person, either in or out of the United Kingdom, who shall invent a portable electric or other safety-lamp, to be used in mines. The following are the conditions: (1.) The £500 to be invested in the names of three trustees, one of whom shall be Mr. Thomas Burt, M.P., the other two to be chosen by the Central Board of the Miners' National Union. (2.) The lamp to be a perfectly portable electric or other lamp, which the working miners can conveniently carry from place to place in the mine, and which will not, under any circumstances whatever, cause an explosion of gas. (3.) The efficiency of the lamps put in for competition to be submitted to five gentlemen composed as follows: Three scientists to be named hereafter, one to be selected by Mr. Lever, one by the Council of the Royal Society, and one by the Council of the Society of Arts; one person representing the mining engineers, chosen by themselves; and one person representing the workmen, chosen by the Central Board of the Miners' National Union. (4.) The adjudicators to meet in London after the allowed time has elapsed. (5.) The offer to remain open until the 31st day of December, 1883. If a lamp meeting the requirements herein stated has not been invented, the £500 to revert to Mr. Ellis Lever.

The Consumption of Charcoal by Swedish Blast-Furnaces.—Dr. Tamm has published in the *Jern Kontorets Annaler* an elaborate paper on the consumption of charcoal by 28 Swedish blast-furnaces. The averages of his tabulated statements are as follows: Hight to tunnel-head, 14·03 meters; hight to bosh, 4·37 meters; diameter of top, 1·65 meters; diameter of bosh, 2·65 meters; diameter of hearth, 1·10 meters; cubical contents, 64·22 cubic meters; pressure of blast, 54 millimeters quicksilver; temperature of blast, 210 degrees Celsius; daily consumption of charcoal, 74·89 cubic meters; percentage of oxygen in ore, on the basis of oxygen in pure peroxide of iron at 100, 93·44; percentage of carbonic acid in charge, 3·97 per cent; yield of iron in charge, 46·50 per cent; quantity of charge borne to one cubic meter of charcoal, 357 kilograms; weekly production of pig, 84,593 kilograms; weight of one cubic meter of charcoal, 159 kilograms; deducting moisture, 136 kilograms. One thousand kilograms of charcoal bore 2170 kilograms of burden. The carbon carried into the furnace by the fuel, ore, and limestone, per 1000 kilograms of pig produced, were as follows: 746 kilograms of pure carbon by the charcoal, 19·9 kilograms of carbon, distilled with the oxygen, by the charcoal; and 24·1 kilograms of carbon by the carbonic acid in the charge. The oxygen entering the gases amounted to 40 kilograms by the charcoal, 388 kilograms by the ore reduced, and 67 kilograms by the carbonic acid in the charge, a total of 492 kilograms to 1000 kilograms of pig. According to the analysis, the escaping gases held 11·9 per cent of volume of carbonic acid, and 25·9 per cent of carbonic oxide, and by computation on the basis that 26·96 volumes of oxygen are carried into the furnace with 100 volumes of nitrogen, the escaping gases contain 57 volumes of nitrogen and 5·2 volumes of hydrocarbons and hydrogen. The ratio of carbonic acid to carbonic oxide, by weight, in the gases, was 0·74. Assuming that 1000 kilograms of pig carry off 40 kilograms of carbon, then 611 kilograms of carbon are burnt to carbonic oxide before the tuyeres, and 95 kilograms, or 13 per cent of the carbon are consumed for the reduction of ore directly.

Rolling Nickel and Iron.—The process invented some years since by Dr. Fleitmann, of Iserlohn, Germany, of making nickel malleable, has

Digitized by Google

attracted considerable attention, and it appears that it is now utilized on a large scale at Schwerte, where pure nickel sheets, sheet steel covered on one or both sides with 5, 10, or 12 per cent of nickel, nickel wire, steel wire plated with 20 per cent of nickel, wire made of an alloy of 25 per cent of nickel and 75 per cent of copper, and similar goods are manufactured. The nickel is made malleable by the addition of one tenth of one per cent of magnesium, the action of which appears to be to reduce occluded carbonic acid and carbonic oxide to carbon. The nickel thus treated is cast into plates, which are reheated and are rolled down to a thickness of 0·08 to 0·12 inch. These sheets are laid upon the steel plates to be coated on one or both sides as the case may be. The steel plates are cleared of cinder, etc., by being pickled or planed. They must be free from blow-holes, and the steel must be of the best, toughest quality. The pile of steel and nickel plates is then covered with thin sheet-iron, to protect it against the action of air, and is then put into a reheating furnace where it is carried to a red heat, and is afterward rolled down under high pressure by from 25 to 40-inch chilled cast-iron rolls, running at a speed of from 20 to 25 revolutions. The rolled piles are put into a pickling bath of dilute sulphuric acid, where they remain until the outer layer of sheet-iron has been entirely removed. The nickel-coated steel sheets are rolled cold in a three-high train in which the middle roll is driven, the other two being idlers Finally, a polish is given to the sheets. It is stated that the process of manufacture has been so well developed in its details that the waste of the original materials employed is only about 10 per cent. The sheets are stamped in manufacturing cooking utensils. One per cent of the goods are rejected on account of defects which are principally traceable to blow-holes in the steel, or other causes affecting the uniformity of the surface of the steel plates. In order to test the question whether nickel would be injurious to health if used for cooking utensils, a dog was fed daily with 0·5 gram of acetate of nickel until the total amounted to 10·5 grams of nickel. The animal remained healthy and gained two pounds in weight. Two liters of milk were kept in a nickel-plated dish for eight days and only absorbed 0·002 grams of the nickel in that time. Dr. Fleitmann has begun to manufacture iron thus plated with nickel, and has made pure nickel castings as heavy as 100 pounds. It is stated that he contemplates manufacturing nickel-plated boiler-plate, in order to prove its advantages for marine and mining purposes. From all accounts, the weld between the steel or iron and the nickel is very good, and this is the principal advantage of Dr. Fleitmann's expensive method over the ordinary method of nickel-plating by electricity.

An American Rival of the Gjers Soaking-Pit.—A recent issue of the *American Manufacturer* contains a very interesting account of the new works of the Bessemer plant of the Pittsburg Steel Casting Company, planned and built by Mr. William Hainsworth. The object of the plant is to produce rather a variety of different grades and sizes of steel castings and shapes than a large product of steel for one purpose, as the majority of existing Bessemer mills. The converter has only five tons capacity, and is built so that it has a deep pit and a slight fall to the mold, in order to insure quiet casting. The only distinctive feature of process proper is, that a rabble is introduced at the close of the blow, in order to insure thorough mixing of the spiegel and produce a uniform metal.

After the ingots have been cast, Mr. Hainsworth keeps them in an upright position until they are rolled, claiming that, until the ingot has thoroughly set, there is danger of having it show interior cavities if turned over on its side. The most interesting part of Mr. Hainsworth's plant is what he calls the "equalizer," the object of which is practically the same as that of the Gjers "soaking-pit," which has attracted so much well-merited attention during the last few months. These equalizers are described by the *American Manufacturer* as follows:

They consist of five square-shaped holes of fire-brick, about 6 feet deep and 3 feet 6 inches square at the bottom, tapering inward to 3 feet square at the top, and on each side of the row are a pair of Siemens regenerators for gas and air, which are supplied by two gas-producers located in the converter building. They are in appearance and construction very similar to a set of five holes for melting crucible steel by Siemens furnaces, such as are to be seen in the crucible department of the same works. In each of these holes four ingots, weighing from one to one and a quarter tons, are placed in a vertical position. The holes having been previously heated to a heat of approximately 2000° F., and filled with gas which forms a non-oxidizing atmosphere, and the ingots, when they are placed in the holes, being of a dark or medium red color on the outside but still fluid in the interior, it requires only a few minutes before the heat is equalized throughout the ingot, the outside becoming heated to a soft yellow heat, and the interior solidified and cooled to about the same heat, in which state the ingot is in the very best condition for rolling to a small billet or even to a flanged rail. Mr. Hainsworth believes that this system of equalizing the heat of ingots is the only one by which a large ingot may be rolled to a thin flanged rail without reheating, and without having the thin flange become too cold for successful rolling before the finishing pass.

When the works are running regularly, the amount of fuel used in the equalizers is almost nothing. The dampers may be shut down, the holes filled with gas, which prevents the ingots from wasting by oxidation, and the air-valve closed, so that the only fuel needed is that required to keep the holes full of gas. The expense of this fuel, on a large output, would be probably not over one cent per ton. As the five holes will contain twenty ingots, and as eight minutes is ample time for the first ingot of each cast to be left in the hole, it will be seen that the five holes are sufficient in capacity for the entire output of a large three-converter steel-works. In the plant of the Pittsburg Steel Casting Company, only three of the five holes are used, and two of them might be sufficient, and, in fact, one has been found sufficient for sixty net tons in eight hours.

Mr. Hainsworth wishes it to be stated that his model of the equalizers was made in 1881, and was shown by him, in the latter part of that year, to Capt. W. R. Jones and Mr. Rinard, of the Edgar Thomson Steel-Works, and, in January and February, 1882, to Mr. James Hemphill and Mr. William Clark, of the Pittsburg Bessemer Steel-Works; to Mr. John Fritz, of the Bethlehem Steel-Works; Mr. Smith, of the Joliet Steel-Works; Mr. Felton, of the Pennsylvania Steel-Works; and several other steel men, well known here and in Europe. The contract for building the "equalizers" was given to William Swindell, of Pittsburg, in January; work was begun upon them in February; and they were completed in May, 1882.

COMPRESSED AIR LOCOMOTIVES IN AN ENGLISH COLLIERY.—Machinery for underground use of a higher class than has been employed before is now in course of adoption in South Staffordshire. There has been introduced at the Cannock and Rugeley collieries, Hednesford, an air-locomotive that gives very satisfactory results. The *Colliery Guardian* reports that the engine is one of Lishman & Young's, and has been made by the Grange Iron Company, near Durham. It has a pair of 4½-inch cylinders, with 8-inch stroke, and is fitted with all the working parts of an ordinary steam locomotive. The receiver (the substitute for the boiler) is 6 feet 6 inches long by 3 feet 6 inches diameter, and is made of Siemens's steel plates. The engine is now working at a pressure of 300 pounds to the square inch, but will stand a pressure of 500 pounds. It is situated at a distance of 1200 yards from the bottom of the shaft. It goes into the stalls and brings the coal directly from the face of work, a distance of 250 yards, delivering it to a station at the bottom of a trough fault. At this, a hauling rope takes hold of the trains and draws them up to where the main hauling engine takes them to the shaft. This main engine is stationed on the surface. It has a 32-inch cylinder, and besides hauling it compresses the air necessary for the smaller air-locomotive. The air-cylinder of the main engine is 20-inch diameter, with 5-foot stroke, and the air is compressed to 65 pounds per square inch. The air at this density is conveyed down the shaft in large receivers, and is taken along the mine for a distance of 850 yards. Here a pair of 12-inch cylinder engines work a 5-inch compressor, and further compress the air up to 300 pounds per square inch. It is then led into a small receiver, and is taken to a point at which the air-locomotive can be charged—an operation that only occupies half a minute.

A PROFITABLE AFRICAN DIAMOND MINE.—It is often, says the London *Mining World*, that the pioneers of a new invention or industry exhaust and impoverish themselves in its development. The depression in the Kimberley and diamond district which now exists is due to this cause. It is stated that during the last two years many hundreds of thousands of pounds have been expended in this industry by local capitalists, and local resources are now at a stand. The business has also suffered from other causes, namely, high local rates, costly working, litigation, and also from a depreciation in the market value for the gems. In the Kimberley District, a great correction of these evils has been found in the amalgamation of various companies working in the same mine under a different title, thus effecting enormous saving in management and working. The success of the Kimberley Central, as it is called, is clearly shown in the fact that in its three years' existence it has paid on its capital of £576,000, dividends and bonuses to the amount of £426,996, or, including the sum carried forward, nearly the whole of its original capital. As an instance of the enormous productiveness of a diamond *mine* when well managed, the figures of this company's operations are at least startling. In less than three years during which it has been worked, it has produced 482,924 carats of diamonds, valued at £744,797. The working of last quarter, ended October 31st last, yielded a net profit of £174,931. Out of this sum, £48,184 was paid in rates, £20,000 carried to reserve, £33,415 brought forward, and the balance applied to a *quarterly* dividend of 12½ per cent.

FURNACE, MILL, AND FACTORY.

Graff, Bennett & Co. have commenced to drill for gas at their Millvale rolling-mill, which is situated a short distance above Alleghany.

The Graff-Bennett Iron-Works at Sharpsburg, Pa., are now operated double in nearly every department. The Danks puddling-furnace, which has been idle for some time, was lighted up last week.

The new furnace of the Cherry Valley Iron Company, at Leetonia, Ohio, is completed, and will be blown in at an early date. The new stack is 75 × 15, and will have a capacity of about 100 tons per day.

The wages of the puddlers at McIlvaine's plate mill, at Reading, Pa., have been reduced from $4.75 to $3.75 per ton for pig-iron. The heaters were reduced proportionately.

The basic process seems now to be making good headway in England. At the Eston works of Bolckow, Vaughan & Co., a new Bessemer converter is building for the purpose of making steel ingots by the basic process. Another converter has also been added, which, when, in operation, will give the works a capacity for producing 16,000 tons of basic steel monthly.

The work of removing the eighteen-inch train of rolls from the old rail-mill of the Cambria Iron Company, at Johnstown, preparatory to the substitution of a twenty-one-inch train, is now in progress, and will consume, together with other needed alterations and improvements, probably six weeks' time. By the change, the mill be enabled to roll heavy as well as light sections.

The hoist of the blast-furnace at East Conemaugh was burnt recently, and the engine was slightly damaged. Operations will be resumed in a few days, unless it should be deemed advisable to shut down for general repairs. The damage will amount to about $500. The furnace has been in blast for nearly seven years.

There seems to be much activity in adding to the plant for manufacturing nails in the West. At Wheeling, four firms are adding a total of 100 machines, and similar news comes from other quarters. This is somewhat strange, in view of the fact that the mills are forced to the policy of suspension so frequently in order to maintain prices; and if this goes on, the strength of the Western Association must ultimately give way. There seems to be even some uneasiness in regard to the growing competition of Eastern works, which are not bound to restrict, and who sell at Chicago and other Western points at from 10 to 15 cents below the $3.40 card rate.

Mushet steel for the knives and dies of nail-machines seems to be doing good work at the Laclede nail-works, Wheeling. It is reported that the knives last longer and produce a cleaner-cut nail.

The Oliphant furnace, located south of Uniontown, Pa., has been blown out for repairs. About three weeks will be required to overhaul the furnace.

The stockholders of the Bay State Iron Company of Boston, in liquidation, recently met, 8100 of the total 8480 shares being represented. Treasurer Richards presented a statement of the company's condition, which shows the total assets to be $1,877,466; liabilities, $581,400. Of the entire unsecured debts, those held in Boston are about $90,000, while those held in New York and elsewhere constitute the balance. It was voted that the assignment of all real and personal property of the corporation in the State of New York, and of all debts due to the corporation from persons or corporations in the State of New York, to be made to trustees for the benefit of its creditors, be approved, and that the directors be authorized to wind up the affairs of the company as soon as possible

The Pittsburg Steel Castings Company, of Pittsburg, appears to be doing goo

Digitized by Google

work with its new Bessemer plant. It has made a casting of a spur-wheel 8 feet diameter, 20-inch face, 6½-inch pitch, which required 18,000 pounds of steel. It required two blows of the converter, the steel made in the first blow being held in the ladle while the second blow was made. The time from the tapping of the cast-iron into the converter for the first blow until the casting was successfully completed was 59 minutes. Another casting of 14,000 pounds, requiring two blows, was successful in 41 minutes from the time the pig metal of the first blow was tapped from the ladle. These feats are believed to be unequaled in the steel-casting business.

Another effort has been made to consolidate coal and iron companies in the Hocking Valley, this time under the name of the Columbus & Hocking Coal and Iron Company. The concerns mentioned are: the Akron Iron Company, at Buchtel; the Crafts Iron Company, at Glendale; the Thomas Iron Company, at Gore; the Winona furnace, at Winona; the Bessie furnace, of Moss & Marshall, New Straitsville; the Thomas Coal and Iron Company, of New Straitsville; and the Longstreth Coal Company, of Longstreth. The authorized capital of the combination is $5,000,000. We understand that there is considerable opposition to the scheme on the part of other companies in the valley.

M. M. Buck & Co., of St. Louis, have received an order for hoisting and other machinery for the mines of Gov. A. C. Hunt, at Laredo, Texas.

The new wire-mill of the Lambert & Bishop Wire Fence Company, of Joliet, will contain large benches of ripping, medium, and small-size wire machinery, and an extensive cleaning, bluing, and drying plant, also an improved annealing plant. Another department will be devoted to a system of galvanizing based on entirely new principles. The basement of the building will be occupied by extensive barb-wire machinery of all descriptions, and to the whole will be added the usual fitting and repairing-shops necessary to a large establishment. The plans have been prepared by Mr. G. M. Rose, late of Birmingham, England, who has been appointed superintendent of the works.

George D. W. Whitcomb, of Chicago, owner of the Harrison mining machine patents, has instituted suit in the United States Circuit Court for the Southern District of Illinois against Joseph, John, and Bernhard Yoch, who have lately begun the manufacture of the Yoch mining machine, the invention of Mr. Bernhard Yoch. The suit is brought on the Harrison reissued patents, Nos. 9408 of October 12th, 1880, and 9439 of November 2d, 1880; and the Whitcomb patents, Nos. 232 and 792 of September 28th, 1880, and 26,704 of November 7th, 1882, the plaintiff alleging an infringement of these patents by the defendants.

The Cleveland Furnace Company, operating the blast-furnace of the Steubenville Coal and Iron Company, has concluded an agreement with large creditors to settle by partial payments within the year, at the end of which a settlement in full is to be made.

It is probable that the new Vulcan furnace at Newberry, Mich., will be blown in early next month.

The Youngstown, Ohio, Steel Company will start at an early date.

At a public meeting of the citizens of Hubbard, Ohio, R. H. Jewell and George M. McKelvey were appointed a committee to solicit subscription for stock in the tin-plate mill. It was also decided at the meeting to erect the mill at a cost of not less than $10,000. The projector of the enterprise, Mr. Hutchins, agrees to put in $6000 in money to begin with, and to allow his salary of $2500 per year to be added for five years to the concern.

The Lidgerwood Manufacturing Company, 96 Liberty street, New York, has appointed J. H. Houghton, General Eastern Agent for the sale of the Lidgerwood engines. Mr. Houghton was for a number of years superintendent for Kendall & Roberts, Cambridgeport, Mass., which position he resigned to accept the one to which he has just been appointed. He will immediately open a store in Boston, where a full line of Lidgerwood engines will be kept in stock.

English papers print a comparison of the blast-furnaces built and at work last year, as compared with the year 1881. It would appear from the published returns that there were 963 furnaces in England last year, against 968 in 1881, while 575 were in blast in 1882, against 555 in the previous year. The greatest increase in the number of furnaces in blast was in Scotland, when 113 out of 148 built were in blast, against 105 at work in 1881, an increase of five furnaces. Cleveland shows an increase of four on the year, 100 being at work, against 96, but there was a decrease of three furnaces built last year, as compared with 1881. East Worcestershire had also an increase of four, 50 being in blast, against 46 in 1881; but there was a decrease of five furnaces built. In Glamorganshire, there was also an increase of four furnaces blowing, so that the districts named furnish the whole of the increase. The chief changes in other districts were a falling-off of four in the northeast and northwest of England. The returns of the furnaces built in some districts scarcely convey a correct idea. Some of the old furnaces, although in existence, will never be working again, as they can not now be worked at a profit in competition with new forms.

GENERAL MINING NEWS.

ARIZONA.

COCHISE COUNTY—TOMBSTONE DISTRICT.

There is nothing new to report from the mines in this district. Work progresses in the usual manner and the prospects remain the same.

GILA COUNTY.

LONG ISLAND.—This smelter is not running at present.

OLD DOMINION.—The smelters are running steadily.

TACOMA.—This company started smelting ore from its mines February 8th. Every thing is running smoothly. Two hundred tons of ore are at the smelter and 250 tons of coke. At the mine, a new strike has been made outside of any former workings. The old portion of the mine is showing splendidly. A tram way 400 feet long has been constructed.

PIMA COUNTY.

According to the Arizona *Citizen*, the group of copper mines in the Patagonia Mountains owned by Messrs. Baldwin, Best, and Cheatham, and known as the Joker, Telephone, Cliff, and Castle claims, are among the finest copper properties in that entire section. The three first named adjoin each other on the same lead; the latter two are distinct ledges that lie almost at right angles from the main lead against which the Cliff abuts. On the Joker is a 4×6 shaft 22 feet deep. It has been sunk in the center of the ledge and shows ore on all sides. As no cross-cutting has been done, the exact width of the ledge can not be ascertained; but as the croppings break boldly for twenty feet in width, it is hardly fair to suppose that the mineral between walls will measure less. All the material taken from the Joker shaft has an assay value in copper of 14 per cent. It also carries a small silver value, but not enough to justify its reduction for that metal alone. The Telegraph lies to the north of the Joker, and has been developed to the extent of an eight-foot shaft. No cross-cutting has been done. The average assay of ore taken from this shaft was 28 per cent. No work has been done on the Cliff, Castle, and Telephone mines.

CALIFORNIA.

MONO COUNTY—BODIE DISTRICT.

BODIE CONSOLIDATED.—During the past week, 132 tons of ore were crushed; average assay value, $62 per ton, that of the sacked ore being $231 per ton. East cross-cut, 1000 level, was advanced 14 feet, and cut another faulting vein. The winze from the 780 level is down 66 feet, showing strong vein. The water is handled without difficulty, the pump working at the rate of 9½ strokes per minute.

BODIE TUNNEL.—The mill is running steadily.

BULWER.—A west cross-cut at a point 317 feet north of the main west cross-cut, 700 level, has been begun.

STANDARD CONSOLIDATED.—During the past week, the Standard milled 1446 tons of ore. The east cross-cut from south drift, 1000 level, is 260 feet long, and is without change. The south drift from east cross-cut, 700 level, is 398 feet long, and the vein in the face is 18 inches wide. The east cross-cut from north drift is in 25 feet. The upper levels continue to look well and yield large quantities of good ore.

PLUMAS COUNTY—GREENVILLE DISTRICT.

CRESCENT.—The Greenville *Bulletin* says: The rich vein of ore now worked 100 feet from the dividing-line between the Taylor-Plumas and the Crescent is pitching toward the Taylor-Plumas ground.

TAYLOR-PLUMAS.—All the indications tend to show that a large chimney of ore will soon be developed.

SAN BERNARDINO COUNTY—PROVIDENCE MINING DISTRICT.

BONANZA KING.—The January product, without clean-up, was $61,777.44. This was the result of ten stamps, dry crushing. It is reported that the mill is working entirely on second-class ore-screenings.

SIERRA COUNTY.

HARLEM MINING AND MILLING COMPANY.—From the company's prospectus we take the following: The company has been incorporated under the laws of the State of New York, with a capital stock of $1,000,000 in 200,000 shares of $5 each. The mine, known as the Kenton mine, is situated on Kanaka Creek, about thirty-five miles northeast of Nevada City. It is opened by two tunnels, one having been driven in 283 feet and the other 750 feet. The tunnels are connected by two uprises. The company is at present driving a third tunnel, which, when completed, will develop the mine to a depth of 520 feet below tunnel No. 2. The vein is said to be a strong ledge in a regular formation of slate, its course being north and south, and the dip 43 degrees to the east. The formation and walls are such that the ores are easily and cheaply mined, and the nature of the ores such that they are rapidly and economically reduced in the mill. The ores are transported to the mill from the mouth of tunnel No. 2 by a tramway 909 feet long. The eighty-stamp mill has a capacity of from 35 to 40 tons per day. The total cost of working the ores is estimated at $2.50 per ton while the average value of the ores as shown by yield in mill is from $7 to $8 per ton. The percentage of sulphurets in the ores is said to be considerably above the average of California gold mines, being about 5 per cent, at times going as high as 15 or 20 per cent. The sulphurets of this mine are peculiar from the large proportion of arsenical pyrites they contain, in many places in the veins passing into almost pure arsenical pyrites and in the latter case many are said to show a yield as high as $7000 or $10,000 per ton. The average yield of the sulphurets from the average ore is $100 per ton. The company proposes to add 12 stamps to the mill, 14 Frue vanners, and build chlorination-works for treating the sulphurets. The total cost of these improvements, including tunnel No. 3 is estimated at $40,000. The officers of the company are: John S. Lockwood, James R. Davies, James J. Kelso, William G. Lord, Henry P. Chapman. Mr. Charles S. Benham is the General Manager.

CENTRAL AMERICA.

NEW YORK & HONDURAS ROSARIO.—Dispatches recently received state that the new mill has started and is working splendidly. Delay was caused by alterations made by Mr. Keay, who, after convincing himself of the character of the mines and the quality and quantity of the ore, considered it necessary to build a larger pan-house for additional pans. Heavy blasting had to be done in hard rock, and the pan-house had to be finished before the mill could run. Official reports from the mines, received by the last mail, are the most favorable the company has yet had. Two additional great strikes are reported, one in the Rosario mine, between the fourth and fifth levels, very rich in gold, and one in the New York mine of the same character. The five mines belonging to this company, it is reported, are all fissure-veins containing valuable ore, and the dumping-grounds of the company are said to be filled with selected ore ready to be milled.

COLORADO.

CLEAR CREEK COUNTY.

SHENANDOAH VALLEY LODE.—A strike consisting of from four to eight inches of fine-grained galena—a sample of which milled 372 ounces of silver per ton—was recently made. The mine is opened by a tunnel 400 feet long. The drift has been driven along the side of the ore-vein. The ore has been uncovered for a distance of 60 feet, and holds out well in the breast.

GILPIN COUNTY.

PERIGO.—The mine is improving as development proceeds. The driving of the tunnel will be resumed shortly.

ROLLINS.—At the annual meeting, it was decided to build a fifty-stamp mill at Rollinsville. Work will be commenced early in the spring. The company decided to continue the work of developing its placer mines on South Boulder, below Rollinsville. Work will be resumed on the lower cross-cut tunnel, which is to be driven under Perigo Mountain, just as soon as the weather will permit, and will use power drills.

LAKE COUNTY.

Late Leadville exchanges contain the following:

The Thespian shaft, on Carbonate Hill, has now attained a depth of 590 feet. The shaft passed through forty feet of contact matter, and has now penetrated the underlying limestone to a depth of twenty feet. Drifting on the contact will begin to-day.

BIG PITTSBURG CONSOLIDATED.—Mr. Frank Buckley, the newly-appointed manager, has declared all the leases granted on this property by his predecessor, Mr. Joseph Vimont, void. Mr. Buckley is preparing to work the property for the company. Considerable opposition will be encountered from the lessees, who all claim to hold legal leases on the mines of the consolidation.

BUCKEYE.—Drifting is in progress at 127 and 168 feet from the surface. Both levels show iron and other encouraging indications.

MORNING AND EVENING STAR MINES.—On the first of the month, these companies commenced shipping their ore to Cummings & Finn's smelter.

SHIELDS.—This mine, located at the head of Little Frying Pan Gulch, is not meeting the expectation heretofore entertained of it. From reliable sources, it is learned that the mine is not making expenses, and unless more money is supplied with which to continue work, the property will doubtless soon revert to the management of the company.

SMUGGLER.—This mine is now shipping from twenty-five to forty tons daily.

OURAY COUNTY.

Mr. W. Weston, in a letter to the Denver *Republican*, writes that an increased prosperity is the decreased cost of turning our ore into dollars. In 1877, we paid $45 per ton for treatment of ores at local reduction-works, and from $20 to $35 per ton to get the ore there on pack animals. In 1880, our ore began to go to the Pueblo works of Mather & Geist, by wagon to Alamosa, the distance to the latter place being over 200 miles, and the cost of freight and treatment being $55 per ton. The cost of freight and treatment of our ore to the Pueblo Smelting and Refining Company is now $35 per ton. In addition to this, the cost of supplies is reduced at least 50 per cent, and the cost of packing the ore from the mines to Ouray at least $5 per ton, so that the average cost of producing the ore and getting it to the shipping point is at least $10 per ton less than in 1880. Therefore we save $20 per ton in freight and treatment to Pueblo, and $10 per ton in producing and getting the ore to Ouray, which makes us receive $30 per ton more for our ore now than we did in 1880. For all this, we are indebted to the Denver & Rio Grande Railroad, and, as the same figures will apply more or less to all the camps in the San Juan region, the incalculable benefit conferred on the State of Colorado by that rail-

Digitized by Google

road may be partially appreciated, for its advent has made paying mines of a thousand prospects whose ores three years ago were as so much waste. If the Denver & Rio Grande Railroad builds a branch from its main line at Montrose to Ouray, the further reduction in freight of ore will not be very great—perhaps $5 per ton—but we shall be able to ship all the ore we can produce, whereas now we are dependent on such wagon freight as may be available. In addition to this, the reduction in prices of supplies and labor, and the building of wagon-roads to the mines, will reduce the cost of laying the ore down in Ouray at least $10 per ton more, which will give us $45 per ton more for our ore than we received in 1880; and it must be remembered, too, that this is reckoning on the ore going to Pueblo, a distance of 275 miles. It does seem to me that with extensive coal-beds in the Uncompahgre Valley, and the mining camps of the Dolores, San Miguel, Ophir, Sneffels, Uncompahgre, Red Mountain, and Poughkeepsie tributary to it, there should be a smelting center established in that valley some time in the near future. To give a notion of the decrease in prices, in 1877, I paid $1 per pound for giant powder that I now buy for 35 cents, and $12 per 100 pounds for flour that I now buy for $4.50. Hay has come down from $55 per ton to $25 per ton, and oats and corn from 10 cents per pound to 3 cents; potatoes from 5 cents per pound to 1½ cents, and other things in proportion. Another assurance of our permanent prosperity has been furnished in the fact that concentration, or getting rid of the waste rock in our ores by machinery, has been proved a success.

PARK COUNTY.

FANNY BARRET.—The superintendent says that the vein which they are following in the drift from No. 2 shaft is holding out finely. Shipments are steadily under way, and the mine last month paid a balance of $2000 above expenses.

MOOSE.—Reports are, that the leasers are doing splendidly on this once famous property. Ten or twelve tons of ore shipped within the past few days. The ore now taken out excels any that the mine has heretofore produced.

SUMMIT COUNTY.

CROWN POINT.—The mine is improving and in the 100-foot level a three-foot vein of high-grade ore has been struck.

GREER.—The concentrating-works have been running satisfactorily since they started up.

WHEEL OF FORTUNE.—The shipments of ore continue. The incline is continued and drifts are started at regular intervals.

DAKOTA.

The recent cold weather closed many of the water-ditches and flumes in the hills, greatly interfering with mining operations. The Sitting Bull smelter and mill are idle in consequence. The Homestake, Caledonia, Esmeralda, and Gustin mills are running at their full capacity.

An important discovery is reported from Fantail Gulch. A test of 100 tons of ore shows an average of $113 per ton.

BLUE LEAD.—This mine was recently purchased by a company of home capitalists, and a thirty-ton smelter has been ordered.

CALEDONIA.—The superintendent reports for week ended February 4th: Ore produced, 1025 tons. Bullion shipped, 582 ounces gold; value about $10,000. South header advanced 5½ feet; total, 50½ feet. Winze advanced 5 feet; total, 17 feet. No new developments in either place.

CASSELL.—This mill is running on Fairview and High Lode Extension ore, the latter averaging $16 per ton.

FATHER DE SMET.—The superintendent's report for the nine days ended February 1st shows: Ore extracted from first level, 1250 tons; second level, 1250 tons; third level, 450 tons. Ore milled, 2850 tons. Third level header in 119 feet; Italian winze down 33 feet.

SUMMIT.—This mill will shortly start upon Initial ore.

IDAHO.

EASTERN IDAHO MINING AND WATER COMPANY.—This company has secured the placer mines situated along Snake River, fourteen miles north of Blackfoot, at what is known as the Rapids or Cedar Point. It is the purpose to construct a ditch of sufficient size to carry water that will, besides furnishing all that is desired for mining purposes, irrigate a large tract of land. A ditch twenty-two miles long, twelve feet wide, and four feet deep is to be made, and as soon as this work is completed, the company will begin mining. From it lateral ditches will be cut to carry water to lands to be irrigated. The company has been organized under the laws of Idaho, with a capital stock of 50,000 shares of $10 each. The officers are: W. N. Shilling, President; W. Borland, Secretary; Lowell Holbrook, Treasurer; P. J. Anson, Manager. The chief place of business is Blackfoot.

MONTANA.

SILVER BAR COUNTY—SUMMIT VALLEY DISTRICT.

The Butte *Miner* says that, although, with one exception, the amounts involved in transfers of mining property during January were comparatively small, the large number of transactions indicates a very healthy condition of the market; and the fact that the deal was in every case between residents of the district, who are thoroughly familiar with the value of the properties, is a gratifying evidence of the confidence of our own citizens in the future of the Summit Valley District. There were twenty-six sales during the month, for which the total prices paid was $81,977. The largest sale was that of the Mountain View lode to Charles X. Larabie for $20,000.

MOULTON.—The three-foot vein uncovered recently by the 300-foot south crosscut is developing in fine shape and widening with the drift. The ore is freer milling than that of the upper levels. Assays run from 60 to 80 ounces, and some specimens have been taken out that were very fine, assaying up in the hundreds. The mill is making a steady run and producing its regular output.

SHONBAR.—The east drift of the 185-foot level has advanced 70 feet on the ledge. The character of the ore has steadily improved, and during the past week a fine body of gray and pink manganese rock has been uncovered which assays from 150 ounces upward.

NEVADA.

BELCHER.—At the annual meeting, held in San Francisco recently, the following directors were elected: James Newlands, President; A. K. P. Harmon, Vice-President; G. W. Beaver, J. H. Dobinson, J. P. Martin; John Crockett, Secretary; S. L. Jones, Superintendent. The secretary's report shows that the receipts aggregated $101,051.17, including $73,198.15 from assessments, $12,603.26 cash on hand, $8804.22 royalties, and $4435.12 air-shaft account. The disbursements include general expense account—city salaries, advertising, rent, etc., $10,669.90; Foreman shaft, $14,186.66; mine expenses, $7416.92; wood, $3750.75; labor, $9721.87; taxes, $1082.40; air-shaft account with mine, $14,851.18; Sutro Tunnel Company 22,610; cash on hand and in bank, $13,137.43; a total of $101,051.17. There have been extracted from the old stopes and fillings during the past year 17,608 tons of low-grade ore, which has yielded to the company a net profit of $8804.22.

NORTH CAROLINA.

CONRAD HILL.—This company produced for the first day's run of the new year, from its twenty-stamp battery, over $480 in gold and concentrates, 6500 pounds of copper from its furnaces, making the total value of the day's product over $1500.

SECREST.—It is reported that William Moller, this city, has bought a two-thirds interest in this mine, in York County.

UTAH.

DESERET.—It is stated that copper ore averaging 40 per cent is shipped to Chicago by this company.

MAMMOTH.—The mine is reported to be looking better than ever before. The building and works just completed, or in process of completion, will cost in the neighborhood of $200,000; they include fourteen furnaces, ifi operation or ready to fire up, and complete reduction and refining-works, for which Mr. Bowers is now in the East getting the machinery.

SAMPSON.—This mine, says the Salt Lake *Tribune*, has attracted much attention for some time past on account of the bodies of ore it is developing. A cut just completed through from the incline to the Van Prang shaft, a distance of 600 feet, passed through good ore a long distance. The snow is four feet deep around the mine, and it is impossible to make shipments.

TINTIC.—The best clean-up on record has just been made by this company. After a three months' run, its yield is close on $60,000, at a cost of $27,000. An additional depth of 140 feet has been sunk on the Northern Spy, which reveals a steady vein going into the depths.

SILVER REEF.

LEEDS.—It is reported that the new management intends to go to work on the fifty thousand tons of tailings on hand, which are expected to yield well and be easily worked.

STORMONT.—The mill crushes daily from thirty-five to forty tons of ore. The mines are looking better and richer as depth is attained, while development is kept moving in the various shafts, levels, and drifts as time and opportunity present.

WYOMING.

Genuine Leadville carbonates, says the Laramie *Boomerang*, have been discovered in the Seminole District, in mines in which several Laramites are interested, who predict a rush to that locality—as soon as the snow disappears—that will equal the charge made on the Carbonate Camp in its early days. The new discoveries of silver ore near Fort Fetterman, in the northern portion of this country, are attracting considerable attention also. But little has been done as yet, however, in the way of development. The districts hereinbefore mentioned are all tributary to Laramie, and draw their supplies from this point. Other districts are coming to the front. Sweetwater County has numerous paying mines within her borders, also Uinta and Carbon. The smelter at Hartville, north of Cheyenne, is turning out tons of copper matte daily, and there is already talk of enlarging. Wyoming has the mineral, and all we need is capital. When we get it, we shall make as good a showing as any mining region in the country—not excepting Colorado, Nevada, or California.

FINANCIAL.

Gold and Silver Stocks.

NEW YORK, Friday Evening, Feb. 16.

The mining market has improved greatly this week, and business has been of a better and more general character. The dealings have not been confined to a few fancy stocks, but have been scattered generally over the whole list. There also seems to be a disposition on the part of speculators to let the non-dividend stocks alone, and to confine themselves chiefly to the dividend-paying stocks.

The chief thing in the market this week has been the strength shown by Alice, Bassick, Green Mountain, Navajo, Elko Consolidated, and Sonora Consolidated, while the weakness of Vizina, Alta-Montana, and the State Lines has also attracted attention. Such stocks as Hall-Anderson, Robinson, Sierra Grande, etc., have been very largely dealt in; but the price has been manipulated to suit the market, and has been strong one day and weak the next. We give a summary of the market below. The total number of shares sold at all the Exchanges this week aggregates 501,725, as against 591,075 last week.

The Comstock shares have been rather quiet at irregular prices. California has been largely dealt in at prices a little weak; it sold from 25@21c. Consolidated Virginia records an active business at irregular prices, selling from 56@60@52@57c. Sierra Nevada was quiet and weak at $4¼@$3¼. Union Consolidated, with a small business, was very irregular, selling from $4.85@$3.60@$4.15. Mexican was also irregular at $3.10@$3.38@3.15, with small transactions. Yellow Jacket sold at $1.25, and Best & Belcher at $4.25. Sutro Tunnel had an active business at irregular prices; it sold from 21@25@22c.

The Leadville stocks were quiet and a little weak. Amie was actively dealt in at steady prices, selling at 20@22@21c. Chrysolite, under a small business, was a little weak; it sold from $1.50@$1.40. Dunkin was dealt in to the extent of 500 shares at 31@30c. Hiberuia sold at 4@5c., with small transactions. Iron Silver records a small business at steady prices; it sold from $2.80@$2.75. Leadville was strong under a small business, and sold from 63@70c. Little Chief was quiet and a little weak at 43@40c. Little Pittsburg records transactions of 800 shares at 63@65c. Big Pittsburg was quiet and irregular, selling at 23@18@19c. Climax sold to the extent of 900 shares at 10@8@9c.

The Bodie stocks were quiet and a little weak. Bodie Consolidated, under a small business, declined from $1.50@$1.25. Bulwer had a fair business at steady prices, selling from 90c.@$1@98c. Standard was quiet and irregular; it sold from $5@$6 @$5½. Goodshaw sold at 7@8c.

The Tuscarora stocks were quiet and a little weak. Grand Prize sold from 80@75c. Belle Isle records a small business and has been weak; it sold from 81 @75c. Navajo has developed considerable strength under a small business; it sold from $5¼@$6⅛@$6¼. North Belle Isle was quiet and irregular at 60@66 @61c. Independence sold to the extent of 800 shares at 77@75c. Elko Consolidated was very largely dealt in and was quite strong; it sold from 10@17 @15c., with a business of 72,900 shares.

In the miscellaneous list, Alice had a fair business at strong prices, selling from $2.75@$2.95. Bassick was moderately dealt in and was quite strong; it sold from $8@$10@$9.25. The Western papers contain the news that suit has been begun in the United States Circuit Court in Colorado by Joseph L. Phillips against the Bassick Mining Company, and C. C. Perkins. He alleges that ore has been taken out of his claims, the Industry and Denver No. 1. This statement will be received with reserve until the other side has been heard from. Eureka Consolidated records a small business at strong prices, selling from $9.50@$10.50. The Green Mountain stocks showed considerable strength under an active business. Gold Stripe sold at 7@8c. Green Mountain was very active and strong, selling from 65@86@84c. Rising Sun sold at 6c., and Cherokee at 6c.

Reports from the Green Mountain mine are favorable. The grade of the ore is said to be improving, and the fact that the rock-drills now at work in the lowest tunnel are pushing that work rapidly encourages the hope that the neglected development-work will be more quickly completed. It is understood that $25,000 of the mortgage bonds have been placed, which puts the management in a better position.

Hall-Anderson was very active at very irregular prices; it declined in the beginning of the week from $1.50@$1.30, but grew stronger at the close and sold to $1.75, closing at $1.55 to-day. Horn-Silver was quiet and strong, selling from $5@$5⅞. Northern Belle records a small business at irregular prices, selling from $10⅛@$9⅝@$10. Ontario developed some strength during the week, but lost it to-day; it sold from $18@$30@$20. Robinson Consolidated was quite active at very irregular prices; it sold from $1.05@$1.20@$1.10. Sierra Grande has been very irregular under a large business; it sold from $2.60 @$2.95@$2.60@$2.75, with a business of 15,950 shares. Silver King was strong, selling from $11@ $11⅛@$11⅝.

Alta has been very actively dealt in, but has been weak; it sold from 15@10c. Bradshaw records a small business at irregular prices, selling from 32@36@34c. Decatur has been active and steady at 9@11c. Harlem M. and M. Company has developed a little strength, under a small business, and has sold from $1.10@ $1.15. Oriental & Miller has been quiet and steady; it sold at 15@13c. Sonora Consolidated records a large business, and has improved in price; it sold from 22@29@28c. South Pacific has been active and irregular at 9@7@8c. The State Line stocks were quiet and steady. Nos. 1 and 4 sold at 3@4c. and Nos. 2 and 3 at 8@7c. Taylor-Plumas has been active and irregular, selling from 19@17@18c.

English capitalists have acquired another mine, which, according to all accounts received thus far, is likely to make a good record. It is the Drum Lummon, situate at Marysville, Montana, which was sold to a newly formed London company, the Montana Company, Limited, by Thomas Cruse, through the agency of the London Mercantile Association, and the Joint Stock Association, Limited. According to the statement of the prospectus of the Montana Company, published in English newspapers, the price paid is £300,000 in cash, and £200,000 in 100,000 fully paid-up shares. Western telegraphic advices state the terms to be $250,000 cash down, and $1,380,000 in April and June. The Montana Company, Limited, has a capital of £600,000 in 300,000 £2 shares, the directors being N. Story Maskelyne, M.P., chairman, and Bernard Fitzpatrick, Wilmot Holland, and Thomas Pyke. Mr. John Darlington, M. E., and Stewart Pixley, both of London, have examined the property, the former giving the reserves at 150,000 tons at $40 per ton. It is proposed to set aside £100,000 for the purchase of machinery to work 100 tons a day, and the public is promised early profits at the rate of £140,000 per annum, on the basis of working 28,000 tons at a cost of £3 per ton.

MEETINGS.

Chestatee Gold Company, Room 81, 140 Nassau street, New York. Special meeting of stockholders, February 20th, at one P.M.

Iron Silver Mining Company, 12 Wall street, New York. Annual meeting of stockholders and election of trustees, March 7th, at twelve M.

Lehigh Coal and Navigation Company, Room Board of Trade, Mercantile Library Building, Tenth above Chestnut street, Philadelphia. Annual meeting of stockholders and election of trustees, February 27th, at eleven A.M.

Silver City Mining and Milling Company, office of Johnes & Wilcox, 120 Broadway, New York. Annual meeting of stockholders and election of trustees, February 24th, at two P.M.

Thorington Gold Mining Company, office of H. A. Vatable & Son, 89 Water street, New York. Annual meeting of stockholders and election of trustees, February 23d, from twelve M. to one P.M.

DIVIDENDS.

The Carbonate Hill Mining Company, of Colorado, has declared dividend No. 2 of five cents per share, payable March 1st. Transfer-books close February 20th, and reopen March 2d.

The Contention Consolidated Mining Company, of Arizona, has declared its regular monthly dividend (No. 13) of twenty-five cents per share, payable February 28th, at the office of the Farmers' Loan and Trust Company, on all stock registered in New York. Transfer-books close February 17th.

The Homestake Mining Company, of Dakota, announces its fifty-fourth dividend for January, amounting to $50,000, payable at the office of the transfer-agents, Messrs. Lounsbery & Haggin, No. 18 Wall street, on February 26th. The total dividends of this company to date amount to $1,862,500.

The Jocuistita Mining Company, of Mexico, has declared a quarterly dividend of $50,000, being fifty cents per share, payable on February 28th. Transfer-books close on the 23d.

The Silver King Mining Company, of Arizona, has declared a dividend of twenty-five cents per share.

UNLISTED QUOTATIONS.

Mr. Alexander C. Lassen, 61 Broadway, under date of February 16th, three P.M., reports the current quotations of unlisted stocks as follows:

PIPE LINE CERTIFICATES.

Messrs. Watson & Gibson, petroleum and mining brokers, 55 Broadway, report as follows for the week ended February 15th:

On February 9th, prices opened $1.03¾, declined to 96⅝c. on the 13th, the lowest price, and closed on the 15th at 99⅝c. bid; opening Friday morning, February 16th, at $1, and sold up to $1.03⅛ by two o'clock P.M. The immediate cause of the decline from $1.03¾ Friday to 96⅜c. Tuesday of this week was the report that Grandin well No. 3, at Porcupine Run, had found oil. As there were three dry wells between this and the large producers in the Cooper tract, this discovery was supposed to indicate an extension of the Forest County oil belt. Added to this was the fact, as posted, that the United Pipe Line Company had increased its already large stock of oil 668,000 barrels during January. It was hard to reconcile this with the bull assertion that oil production was less than consumption. Moreover, a new well in Forest County, owned by the Forest County Oil Company, came in as a producer of about 200 barrels. These facts all indicated that an oil famine was not imminent, and the selling movement that followed no doubt caught a number of "stop orders." The weakness of Tuesday was followed by a rapid recovery and sharp advance Friday of this week. A considerable short interest was created; and in their rush to cover, prices have bounded up. It is probable that oil for a few weeks will oscillate about the dollar point, being a purchase under that figure and a sale from $1.04@$1.05. Intrinsically, it is worth $1, but carrying and storage charges are a heavy tax on bull speculation, and make occasional drops natural and frequent.

The following table gives the quotations and sales at the New York Mining Stock Exchange:

	Opening.	Highest.	Lowest.	Closing.	Sales.
Feb. 10...	$1.03⅞	$1.04	$1.01	$1.02	548,000
12...	1.01⅞	1.01⅞	.98½	.98⅝	1,003,000
13...	.98	1.00¾	.96¾	1.00¼	723,000

15...	.98	1.00	.97⅛	.99½	841,000
16...	1.02½	1.03	1.00¼	1.01⅜–⅝	1,063,000
Total sales.					5,137,000

REVIEW OF THE SAN FRANCISCO MARKET.

The San Francisco market has been active and steady. The Comstock shares have had a good portion of the business done, and have slightly improved in price. There is nothing of importance from the mines. The drift running east of the joint Union-Sierra winze on the 2900 level has just passed through 12 feet of low-grade ore. The Tuscarora stocks have been quiet and steady. All of the stock of Navajo offered on the market has been absorbed in checking the recent decline.

Copper and Silver Stocks.

Reported by C. H. Smith, 15 Congress street, Boston, Stock Broker and Member of the Boston Mining and Stock Exchanges.

BOSTON, Feb. 15.

There is no improvement to note in the market for copper stocks. A general dullness pervades the whole list, and the decline in ingot copper serves to depress prices, while the orders to sell are largely in excess of the demand. Calumet & Hecla is the strongest stock on the list, all the sales the past week being at $243 t which figure it is in fair demand. Franklin de

Digitized by Google

clined from $13⅛@$12¼ on forced sales. The expected dividend on this stock does not seem to be forthcoming, and holders are beginning to have some doubt about receiving it at a very early day. Pewabic sales were all at $8, although the stock is heavy and offered at $7¾, the best bid to-day being $7. Quincy has shown a little more firmness this week, although the dealings have been confined chiefly to small lots at $50½@$51, closing to-day at the lower rate. Osceola sold in small lots at $30½@$31. Atlantic sold at $14. Huron, at $1⅝. National, at $1⅛; and Allouez at $2@$2½.

In silver stocks, Bonanza was steady at $2¾@$2⅝. Catalpa and Crescent have been very dull this week; sales of the former at 90c., and of the latter at 42½@40c. Harshaw declined from $1@75c. San Pedro has been active, and advanced from 75@87½c., but closed lower at 80c.; sales aggregate about 10,000 shares. Silver Islet sold at $6. Sullivan, at 87½c. Napa Quicksilver, at $3½.

At the Boston Mining Exchange, Massachusetts & New Mexico has been very active at a further decline on large sales from 8@6c., but in the later dealings it was in better demand at 7c. Empire has further declined from 26@20c. Pipe line certificates declined from $1.04½@97⅝c.

3 P.M.—There was no special feature in the market this afternoon, except its extreme dullness. Calumet & Hecla declined to $242, sales and bid. Osceola sold at $31. San Pedro, 80c. Bonanza sold at $2⅝. The closing prices were: Allouez, $2½ bid. Atlantic, $11¼ bid, $14 asked. Antimony, $14 bid, $15 asked. Bonanza, $2⅝ bid, $2¾ asked. Catalpa, 90c. bid. Crescent, 32½c. bid, 40c. asked. Franklin, $12 bid, $13 asked. Harshaw, $1⅛ bid, $1 asked. Huron, $1½ bid. National, $1⅛ bid, $2 asked. Pewabic, $7 bid, $7½ asked. Quincy, $50½@$51. Silver Islet, $5@$7. Sullivan, $⅝@$1. San Pedro, 80c. bid.

BULLION MARKET.

NEW YORK, Friday Evening, Feb. 16.

The market has been without any feature worthy of note since our last week's postings, except that exchange on India is less favorable to silver.

DATE.	London Pence.	N. Y. Cents.	DATE.	London Pence.	N. Y. Cents.
Feb. 10	50 7-16	110	Feb. 14	50 7-16	110
12	50 7-16	110	15	50 7-16	110
13	50 7-16	110	16	50 7-16	110

Bullion Receipts at New York.—The bullion received from the mines at the various offices in this city during the week ended February 16th, as compiled from various sources, amounted to $247,734.16, as against $151,295.02 reported for the previous week. The receipts from January 1st, 1883, to date are $2,070,907.67.

Foreign Bank Statements.—The governors of the Bank of England, at their regular weekly meeting, reduced the bank's minimum rate for discount from 4 to 3½ per cent. During the week, the bank gained £210,000 bullion on balance, but the proportion of its reserve to its liabilities was reduced from 46⅛ to 44 15-16 per cent, against 37⅝ per cent at the same date last year. The weekly statement of the Bank of France shows an increase of 5,875,000 francs gold and 612,500 francs silver.

BULLION PRODUCTION FOR 1883.

We give below a statement showing the latest bullion shipments. These are officially obtained from the companies, where that is possible; and where official statements can not be procured, we take the latest shipments published in those papers nearest to the mines reported. The table gives the amount shipped for the week up to the date given, as well as the aggregate shipments to such date from the first of January, 1883.

The shipments of silver bullion are valued at $1.29·29 per ounce troy; gold at the standard $20.67 per ounce troy. The actual value of the silver in the following table is therefore subject to a discount, depending on the market price of silver. If the price of silver be counted at $1.12 an ounce, which has for some months been about its average value, the following figures, where they relate to silver bullion, should be diminished by about 13½ per cent, to arrive at actual value.

IRON MARKET REVIEW.

NEW YORK, Friday Evening, Feb. 16.

The iron and metal trades have lost in the Hon. William E. Dodge one who was for many years one of the most prominent men in the trade. Expressions of the high appreciation in which he was held have spontaneously come from many quarters.

American Pig.—The market is still in an unsettled and unsatisfactory condition, and those who are forced to realize must be willing to make concessions so far as all but choice foundry grades are concerned. These are still firm at $26, but prices on ordinary and standard are in buyer's favor. We quote $23.50@$25 for No. 1 and $22.50@$23.50 for No. 2. Recently, contracts were closed by one furnace firm for Forge Pig for delivery to founders of water-pipe, which makes the aggregate sales for that company of Forge since the beginning of the year 200,000 tons. We quote $20@$20.50 at tide-water for Gray Forge. Bessemer Pig is dull and lifeless, with values ranging between $22@$22.50. England cables 52@54c. 6d. for Hematite. Spiegeleisen is dull, 20 per cent offering freely at $33.

Mr. Swank's production and stock statistics, which we print elsewhere, are a surprise to the trade. The production is much heavier than was anticipated, and the stocks, notably of anthracite, are small in makers' hands. Those of charcoal pig are heavy, and fully account for the very low prices at which these grades are selling in the West.

With makers' stocks not heavy and the consumers who have pursued a hand-to-mouth policy so long practically without any stocks, and 417 furnaces blowing, against 446 last year, and diminished imports, the statistical position is decidedly good.

Still, it is likely that the trade is doomed to some weeks of inactivity, as the yearly contracts, generally well entered into in other years at this season, will be pending until Congress has adjourned.

Scotch Pig.—There is a little better feeling, due to more inquiry and a rise of ocean freights from Glasgow from 5s. to 6s. 6d. @7s. 6d. Sales aggregate 1000 tons of various brands, while arrivals are light and have partially gone into store. We quote Coltness, $24.50@$25; Summerlee, $24@$24.50; Dalmellington, $22; Glengarnock, $22@$22.50; and Eglinton, $21@$21.50. The Wall Street Exchange has received the following Glasgow quotations by cable to-day: Carnbroe, 55s. 3d.; Gartsherrie and Summerlee, 62s.; Coltness, 65s.; Langloan, 65s. 6d.; Glengarnock, 55s. 3d.; and Eglinton, 49s. 9d.; Warrants are 47s. 9d., a slight rise.

Steel Rails.—There is very little business doing, and there seems to be a weakness and some irregularity. Rails for summer delivery are quoted $40 at tide-water, and $38@$39 at mill. England cables £5@£5 5s.

Old Rails.—Nothing of any account has been done. We quote Ts $24.50@$25.

Scrap.—We have no business to report. No. 1 is quoted $24.50@$25 ex ship.

Philadelphia. Feb. 16.

Iron and steel manufacturing interests are heartily wearied of the long contest as to what tariff duties shall be, and look with much interest to the promised early termination of the contest. The trade has already very largely discounted the reductions. Just what the actual results will be, however, can not be safely stated. Careful canvassing as to the probable demand during March and April leads experienced iron men to the belief that the demand will be large and the entire output promptly placed. Consumers have been held in check for a long time by uncertainties as to legislation, and they are waiting for an end, in order that they may place their pressing requirements. The decline in quotations will afford encouragment to them, and manufacturers are confident of a large business. To-day's quotations for mill irons are $21. Sales are made on both sides of this limit. No. 2 iron is selling at $22.50@$23.50, although the bulk of transactions which have come to notice since last report have been made nearer the minimum limit than the maximum. The foundries are doing much less work than usual, and are not buying, hence No. 1 is weak, and stocks are accumulating at several furnaces. Schuylkill and Lehigh valleys are duller than they have been for months, and shipments are restricted to absolute requirements.

Manufactured Iron.—The movements of finished iron are any thing but encouraging, and consumers are waiting for a winding up of the tariff legislation. It is said by leading manufacturers that business is to be had, but they are extremely solicitous for the passage of a tariff law. The card rates are 2·40c., but for two weeks past this figure has not been insisted upon excepting in occasional instances for small lots. All the new business that has been placed has been taken at about 2·25@2·35c. Common iron has been booked down as low as 2c. Country mills are ready for business at 2·10c., and the competition has tended to weaken city quotations. Western mills are taking business at 1·80@2c., and even these low prices do not bring in much business. The entire finished iron market is in an unsettled condition, and will remain so until the trade can feel it is on solid ground.

Wrought Pipes and Tubes.—Discounts are 65 to 67½ off for wrought pipe, and boiler tubes are 55. There has been a fair amount of business closed this week which has been hanging fire for a long time. Business in cast pipe is of moderate dimensions and has been closed at 35@37½, according to size of pipe and weight.

Shaped Iron is not very active, though inquiries have been received for considerable lots, and quotations have been made at low rates. Angles are 2·50. @2c.; Channels, 3¾c.; Beams, 3½c. The dullness has led to considerable shading of prices, and it is not possible to see what inside prices are.

Plate and Tank Iron.—The larger manufacturers have had a few inquiries for spring delivery, and some business is likely to be closed in a few days, but

Digitized by Google

prices are not down. Tank Iron has been quoted at 2½c., but better terms can be had. Shell, 3½c.; Flange, 4¼c.; Fire-Box, 5¼c. Several small shipments have been made from Eastern Pennsylvania mills, but the general business is trifling, and all sides are waiting for definite results. Sheet-iron is weaker, and card rates run from 4@4½c., according to gauge. Galvanized is 35 per cent off, and a fair amount of business was transacted.

Steel Rails.—Quotations run from $39@$40. The reduction in duties has given rise to some correspondence between projectors and manufacturers, and possibly the quotations may be revised in a few days, which will lead to the placing of a few large orders which can be secured. The tendency is downward, and buyers expect to obtain better terms than those now quoted. The market is unsettled.

Old Material.—Quotations are $25@$26 for Tees, according to location; $27.50 for Double-Heads. American are quoted at $27@$28, according to where they are. Scrap-iron sold at $25.50 for No. 2. Four or five small lots of selected brought from $27@$27.50. The supply of selected is not very large, but medium and lower grades are abundant. Machinery cast is quoted at $19@$20.

Metals.—The movement in metals is sluggish.

Louisville. Feb. 13.

[Specially reported by GEORGE H. HULL & Co.]

The market for hot-blast iron is quiet. Most buyers not already stocked are pursuing the hand-to-mouth policy. Few if any large sales are making. Quotations for cold-blast iron are still nominal. We quote, for cash, in round lots, as below:

FOUNDRY IRON.

No. 1, Hanging Rock Charcoal	$26.00@$27.00
" 1, Southern Charcoal	22.50@ 23.00
" 1, Hanging Rock Stone-Coal and Coke	22.00@ 22.50
" 1, Southern, Stone-Coal and Coke	22.00@ 22.50
" 2, Southern, Stone-Coal and Coke	21.00@ 21.50
" American Scotch"	21.00@ 22.00
Open Silver Gray	20.00@ 20.50
Close Silver Gray	19.00@ 19.50

MILL-IRONS.

No. 1, Charcoal	$21.00@$21 50
" 1, Stone-Coal and Coke, Neutral	19.50@ 20.50
" 2, Stone-Coal and Coke, Neutral	19.00@ 19.50
" 1, Stone-Coal and Coke, Cold-Short	18.50@ 19.00
" 2, Stone Coal and Coke, Cold-Short	18.50@ 19.00
White and Mottled, Cold Short and Neutral	17.50@ 18.00

CAR-WHEEL IRONS.

Hanging Rock, Cold-Blast	$30.00@$32.00
Hanging Rock, Warm-Blast	25.00@ 27.00
Alabama and Georgia, Warm and Cold-Blast	26.00@ 28.00
Central Kentucky, Cold-Blast	26.00@ 28.00

METALS.

NEW YORK, Friday Evening, Feb. 16.

Copper.—The market has been very unsettled, Western copper selling to the extent of about 250,000 pounds at 15⅝c., with rumors of transactions at lower figures. It is difficult to understand the motive for this slaughtering of the metal, especially when Anchor and Arizona Baltimore are firmly held at 17⅛c., and are selling in small parcels at that figure. The difference between the price of Western copper and Lake has become so large that there must be much temptation to manufacturers of copper who hold Lake to part with some of it and buy Western for a mixture. Holders of Lake insist upon 18c., but can find no buyers to take hold.

It is a noteworthy fact that the exports of copper material are assuming a larger scale.

London cables £65 10s.@£65 15s. for Chili Bars and £72@£72 5s. for Best Selected.

Tin.—This metal appears to be in a strong position temporarily, with quotations for large lines at 21c. cash for Straits, 21⅛c. for Malacca, and 21¼ for Australian. Sales during the week aggregate 150 tons. England cables to-day £93 5s.@£93 10s.

Lead.—There has been absolutely no business, buyers declining to enter the market, while holders have not as yet changed their views. We quote nominally 4·50c. for Common and 4·60c. for Refined, but it is doubtful whether that figure could be realized if the metal were forced on the market.

Nevada journals announce that the Richmond Company has made a contract to ship 10,000 tons of lead here by way of Palisades, via the Central Pacific to Lathrop, Cal., thence by the Southern Pacific to New Orleans. This is, of course, for a longer period. The Richmond Company's stock as yet is not greater than 6000 or 7000 tons, which is still held at 4·90c. Its presence, of course, checks any speculative move. England cables £13 10s.@£13 15s. for Common.

Spelter.—This metal is as dull as ever, being freely offered at 4⅝c., while it is probably procurable at 4·50c.

Antimony.—There has been no change since our last, and we quote 10@10½c. for Hallett's, and 11@11½c. for Cookson's.

COAL TRADE REVIEW.

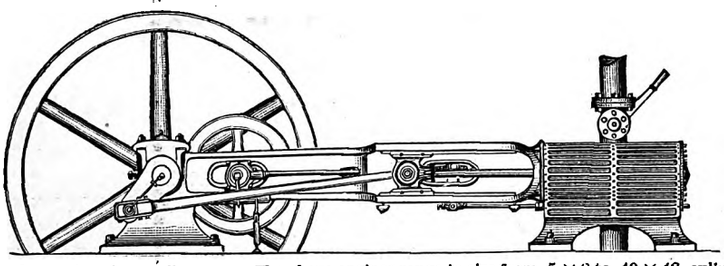
NEW YORK, Friday Evening, Feb. 16.

Anthracite.

In some quarters, the local anthracite trade is reported a trifle better in tone, the ruling f. o. b. prices being about $3.75@$3.80 for broken, $3.85@$3.90 for egg, and $4.30@4.35 for stove and chestnut. The market is decidedly in buyers' favor, but there was comparatively little disposition to take hold.

The most interesting fact which has come out during the week is, that two of the large companies have reduced their prices for Eastern shipments, the f. o. b. prices being made $3.65 for broken, $3.75 for egg, and $4.20 for stove and chestnut. The other companies have followed suit, and there is a possibility of a fight.

The production for the week ended February 10th, 1883, was 658,041 tons, against 338,466 tons for the corresponding week in 1882. The total for 1883 up to February 10th was 2,774,285 tons, against 2,439,637 tons in the same period last year, an increase in 1883 of 334,598 tons.



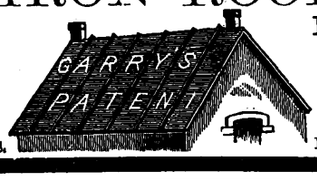
Bituminous.

The most important feature in the bituminous coal trade during the week is the announcement that the Baltimore & Ohio and the Pennsylvania railroads have reached an understanding in the matter of coal freights from the Cumberland and the Clearfield bituminous region. It is stated that this is the outgrowth of threats by the Baltimore & Ohio Railroad to cut rates. The figure which has been mentioned to us by a very reliable authority as the newly established rate from the Clearfield region to South Amboy is excessively high, and would make it impossible to lay down coal here below $4.75 or $4.85.

The market is very dull, which is chiefly owing to the fact that the great majority of foreign steamers come in light and carry enough coal to take them back. In a number of cases, Scotch and some Welsh coals are even sold here at low prices, $3.40@$3.50 alongside of vessel.

We hear of occasional sales of Clearfield coal, off lots, at prices lower than $4.50, which is, however, the ruling quotation. Cumberland is still quoted $4.40@$4.80; but good buyers would probably succeed in getting coal at somewhat lower figures.

THE CUMMER ENGINE



Combines more points of excellence than any engine now in the market. We make five classes of these engines, suited to any duty, as follows: Class A, self-contained, automatic, high-speed engines; Class B, special engines, automatic, overhanging cylinder; Class C, our standard engine, girder frame, automatic; Class D, slide-valve engine, with fixed cut off; Class E, self-contained slide-valve engines for small powers. The above engines range in size from 5 × 8 to 40 × 48 cylinder, and from 5 to 1000 H-P. Engines made non-condensing, condensing, and compound condensing to meet any requirement. Correspondence solicited. Mention this paper. Address

DIVIDENDS.

NEW YORK, Feb. 12, 1883.

THE CONTENTION CONSOLIDATED MINING COMPANY this day declared its regular monthly Dividend, No. 13, of

TWENTY-FIVE CENTS PER SHARE,

payable February 28th, 1882, at the office of the Farmers' Loan and Trust Company, No. 26 Exchange Place, on all stock registered in New York.

Transfer-books close on February 17th.

W. HART SMITH, Vice-President.

OFFICE OF THE JOCUISTITA MINING COMPANY, No. 18 Wall Street,
NEW YORK, Feb. 14, 1883.

DIVIDEND NO. 7.

The JOCUISTITA MINING COMPANY has this day declared a quarterly dividend of Fifty Thousand Dollars, being FIFTY CENTS (50c.) per share, payable at the office of Lounsbery & Haggin, No. 18 Wall Street, on the 28th inst.

Transfer-books close on the 23d inst.

R. P. LOUNSBERY, President.

OFFICE OF THE HOMESTAKE MINING COMPANY, No. 18 Wall Street,
NEW YORK, Feb. 12, 1883.

DIVIDEND NO. 54.

The regular monthly dividend of FORTY CENTS per share has been declared for January, payable at the office of the transfer-agents, Lounsbery & Haggin, No. 18 Wall Street, on the 26th inst.

Transfer-books close on the 20th inst.

LOUNSBERY & HAGGIN, Transfer-Agents.

PATENTS.

SECURED and **SOLD** in all countries. Partners procured, Joint Stock Companies organized. 52 page "Inventor's Handbook" free, giving patent laws of all countries and full information how to procure, sell, develope or secure capital on patents. **E. L. RICHARDS & CO. 814 B'way, N.Y.**

THREE THOUSAND SHARES (PAR $1) of Mining Stock for sale, capital $500,000. One of the best properties in Colorado. Close corporation, owned by a few persons representing some of the most honorable and responsible business and banking firms in the city. The purchaser will be guaranteed against loss, and may anticipate a very large profit on his investment. Private reasons for selling. Full particulars given on application to

THE text of the commercial treaty upon which the United States and Mexico have agreed has been published. The schedule of articles of American manufacture which the Mexican government will admit free of duty includes almost all the materials, machinery, and supplies needed in mining and metallurgical operations, for farming and the railroads.

THE Senate has passed its little tariff bill without materially changing the duties provided in its schedules as first adopted, and the country is now in a gentle state of excitement to know what the result of the dickering of the various factions in the House will be. The principal difficulty now seems to be to get the bill before a conference committee.

OWING to an unfortunate mutilation in the printer's hands of the manuscript of our article on the Boss continuous system, the tailings from the Sierra Grande mill were made a little too rich to be allowed to be neglected, and we unnecessarily exaggerated a trouble that has been puzzling the engineers connected with that company. Even they can not afford to have 23 per cent of silver in the tailings. It ought to have read *silica*.

WE print elsewhere a full report of the proceedings of the Boston Meeting of the American Institute of Mining Engineers, including all but the final session. The attendance was large, and the papers presented were of considerable interest. The excursions were very well planned throughout, and were very well attended, the other attractions of a city like Boston causing less scattering than is occasionally noticed at the winter meetings.

MR. J. S. JEANS, Secretary of the British Iron Trade Association, has just issued a statement of the statistics of production of pig-iron and the stocks in Great Britain. According to his figures, the output reached the enormous total of 8,493,287 gross tons, the Cleveland District leading with 2,688,650 tons, Scotland following with 1,126,000 tons, and the West Cumberland hematite district with 1,001,181 tons. Restriction in the Cleveland and Scotch districts reduced the stocks during the year in those sections by 215,991 tons ; but an increased make in a large number of other districts made up for part of the decrease, bringing the stocks at the close of last year up to 1,576,894 tons, against 1,736,262 tons on the 31st December, 1881.

THE rapid succession of failures and embarrassments in the iron trade and the general apathy in that great industry have caused an erroneous impression to go abroad. It is believed by many that the business is on an unsound basis, and that the troubles referred to are only the forerunners of general and widespread financial disaster. While we fully acknowledge that iron-masters are in some cases only holding their own, and in many others are reaping only small profits, compared with former years, we must very energetically protest against any such pessimistic views as those to which we have alluded. It would be tedious to go into details, but it can, we believe, be shown that the embarrassments of the last month are due to special causes, aggravated, of course, by the prevailing dullness of trade. Over-speculation, mismanagement, unfavorable location, etc., have been the principal causes of these local failures. They are not characteristic of the iron trade. They can not be considered as a deep-rooted disease, of which the happenings of the past few months are only the outgrowth. The stagnation in the trade is largely artificial and temporary. For fully a year, buyers have been sailing closely to the wind, and when the tariff agitation was intensified by the interminable and ill-directed discussion in Congress, they were positively frightened out of the market. On the other hand, the production, which otherwise would have been very great, was checked by labor troubles in many sections in the country, and stocks are consequently low in the hands of producers, middlemen, and consumers. Any impetus to trade which the generally favorable situation of business in the country would easily furnish would therefore have an exceptionally powerful influence under the circumstances, and there are those who feel warranted in dreading an undue activity that might lead to a repetition on a smaller scale of the unfortunate boom period.

THE Census Bureau has published a summary of what promises to become one of the most interesting monographs in the series. The statistics of the traffic and fiscal operations of the railroads of the United States have never been so fully collected and so clearly presented. Much of the success of the Census Bureau in accomplishing this work is of course due to its exceptional facilitities, the absence of which no industry or enterprise on the part of those who have attempted to present similar figures could outweigh. But even with such advantages, the work has required a high degree of diligence and of thorough familiarity with the subject. According to the data submitted, there were at the close of the census year ended June 30th, 1880, 87,891·35 miles of finished railroad in the United States, the construction of which cost $4,112,367,276. The equipment cost $418,045,458, the value of the lands was $103,319,845, the value of telegraph lines and miscellaneous improvements was $204,918,196, while the stock and bonds issued by other lines held by railroads was $343,800,131, making the total of permanent investments $5,182,445,806. In addition to these, the railroads had cash assets footing up to $353,973,981, and profit and loss to credit of $110,697,228, the total assets being $5,536,419,787. The total capital paid in and borrowed is $5,425,722,560, including $2,613,606,264 capital stock paid in, $2,390,915,402 funded debt and $421,200,894 unfunded debt, the latter including $68,750,288 interest unpaid and $13,059,983 dividends. From total transportation earnings of $580,450,594, swelled to $661,295,392 by income from other sources, expenditures of all kinds footing up to $541,950,795, including $352,800,121 for transportation, must be deducted, leaving a net profit of $119,344,597, out of which $70,550,342 of dividends were declared. The general average earnings upon the stock of all the companies were only 4·566 per cent, and only 2·699 per cent of dividends were paid ; 623 companies, representing 80 per cent of the aggregate stock of the country, were operated at an average profit of 6·23 per cent. A part of the rest made a deficit, and another part was still under construction.

The itemized statement of the transportation expenses of the railroads is particularly interesting, because it gives some idea how valuable customers they are to many industries. Among the heaviest expenses we find the following : Repairs of road-bed and track, $39,603,076, or 11·23 per cent of the total ; renewal of rails, $17,243,950, or 4·89 per cent ; renewal of ties, $10,741,577, or 3·04 per cent ; repairs of bridges, $9,009,097, or 2·55 per cent ; repairs of locomotives, $21,880,963, or 6·19 per cent ; repairs of passenger and baggage-cars, $10,558,824, or 2·99 per cent ; and repairs of freight-cars, $22,595,533, or 6·40 per cent—the aggregate of the cost of maintaining road and rolling stock being nearly one

Digitized by Google

half of the whole transportation expenses. One of the heaviest items of the operating and miscellaneous expenses is the fuel for locomotives, being $32,836,470, or 9·31 per cent.

The railroads of the United States transported 290,897,895 tons of freight, hauling it on an average 112 miles, at a cost of 0·76 cent per ton per mile, while they carried 269,583,340 passengers, on an average of 23 miles, at a cost of 1·71 cents.

CORRESPONDENCE.

[Communications will be noticed only when accompanied with the full name and address of the writer. Unless specially desired, only initials will be printed. We invite criticism and comment by the readers of the ENGINEERING AND MINING JOURNAL. Replies not intended for publication should be addressed to the Editor of the ENGINEERING AND MINING JOURNAL in blank, stamped, and sealed envelopes.]

The Report of the California State Mineralogist.

EDITOR ENGINEERING AND MINING JOURNAL:

SIR: In reply to correspondence forwarded to me by you, I will state that the report is for gratuitous distribution, and that all applications for it have been honored, without favor. Out of 2000 copies, less than 100 remain, all of which will be disposed of before you receive this. There is a bill before the State Legislature to reprint 5000 copies; but I have but little hope of its passage, owing to the short term and unusual press of bills. Should, however, the appropriation be made, certain crudities, noticed in your review, will be corrected, and the work carefully revised.

Very respectfully, HENRY G. HANKS, State Mineralogist.

SAN FRANCISCO, CAL., Feb. 15, 1883.

Assaying in Our Mining Schools.

EDITOR ENGINEERING AND MINING JOURNAL:

SIR: I note in your issue of January 20th an article entitled "Suggestions to Young Assayers," signed by E. D. Peters, Jr., who makes some statements which, although in the main true, will not hold good in all cases. He speaks of students making two or three scorifications during the day, and being found wanting when they enter practical life, and of making "sixty assays" before dinner. He does not state how many furnaces are needed for this, but I assume that he means only one. For accurate work, such an output is impossible. I speak whereof I know, having been student and instructor in assaying, and also manager of various mines, with young graduates under me. In the best mining schools in this country, students are required to build their own fires, make their own cupels, and brasque their own crucibles; and last, but not least, no student leaves a reputable school of mines with a diploma, ignorant of the adjustments of his balance.

Mr. Peters also refers to the "crucible assay" as something new or unusual. Let me ask him to step into the assay laboratory of almost any of our mining schools, and he will find that operation in full blast.

He speaks of the assayer granulating his own lead. This is well enough if he chooses to do so, but I prefer to buy. I have a very unpleasant remembrance of this operation in Idaho territory a few years ago.

I can indorse his statement as to recent graduates to a certain extent; they, like new employés in other lines, have to learn the ways of their superiors; but my experience, extending through some years, has taught me that the recent graduate, though perhaps slow, is more accurate in his work than the older one. He often strains at a gnat and gives birth to a camel.

Mr. Peters is evidently not familiar with American mining schools, else he would not write as he does. He has probably been led into the not uncommon error of judging our graduates by the host of self-constituted assayers that abound in our Western territories.

NELSON W. PERRY, E.M.,
Supt. and Eng. N. Y. M. M. Co.

PIÑOS, ZACATECAS, MEXICO, Feb. 7, 1883.

THE BOSTON MEETING OF THE AMERICAN INSTITUTE OF MINING ENGINEERS.

The annual meeting of the American Institute of Mining Engineers was opened with a session on Tuesday evening, February 20th, in one of the parlors of the Brunswick Hotel, Boston, a large number of members, among them the following gentlemen, being present. During the course of the meeting and the excursions, many others joined the party with their ladies:

Prof. Alexander Agassiz, John S. Alexander, W. Lawrence Austin, Richard D. Baker, James C. Bayles, William F. Biddle, Prof. W. P. Blake, George W. Bramwell, William Burnham, F. von A. Cabeen, R. C. Canby, S. H. Chauvenet, Townsend V. Church, Charles E. Coffin, C. Constable, Frederick H. Daniels, Dr. Thomas M. Drown, S. F. Emmons, W. E. C. Eustis, J. W. Farquhar, E. L. Ford, Robert Forsyth, Dr. Persifor Frazer, John Fritz, Albert F. Hill, Henry M. Howe, Robert W. Hunt, Dr. T. Sterry Hunt, Charles Kirchhoff, Jr., Wheaton B. Kunhardt, L. G. Laureau, E. D. Leavitt, Jr., Samuel W. Lewis, Walter McDermott, W. F. Mattes, George W. Maynard, Philip W. Moen, J. H. Paddock, R. W. Raymond, Ellen H. Richards, Prof. R. H. Richards, J. H. Ricketson, Percival Roberts, Jr., R. P. Rothwell, Henry H. Sawyer, Oliver P. Scaife, S. P. Sharples, John M. Sherrerd, Porter W. Shimer, J. William Smith, Herbert G. Torrey, S. T. Wellman, William H. Wiley.

THE FIRST SESSION.

The proceedings began with a thoughtful address of welcome by Mr. Edward Atkinson, who is the acknowledged leader and representative of large manufacturing interests in the Eastern States. Mr. Atkinson, after briefly touching upon the relations of agriculture and mining and metallurgical interests, dwelt upon the fact, that while Massachusetts was once the seat of an important iron industry, it now occupied a very low rank in the list of producing States. He referred to the manufacture of iron from bog ores at Saugus and Braintree, those being among the first efforts made in America toward the utilization of her mineral deposits. He alluded to the fact that the dies for coining the pine-tree shillings were made at home, and pointed out that the descendants of Revere, the coppersmith, whose deeds historians have recorded, built up a great copper industry until what he called the destructive interference of the statute laws of the country deprived them of their supplies and closed their works in Boston harbor. He urged with much enthusiasm and ingenuity that, with all the advantages which this country possessed in natural resources, extensive and valuable beds of coal, great and accessible deposits of pure ores, it was being steadily placed at a greater disadvantage. The high duties on crude and finished materials were placing New England at a greater disadvantage when compared with other sections, and were protecting the machine shops and ship-yards of Great Britain against a formidable rival. The achievements of our engineers, the enterprise, skill, and ingenuity which they have displayed, prove that they have nothing to fear from the rivalry of those of other countries; and the superior intelligence, skill, and industry of our labor places it in a position where it need not dread the competition of "pauper" labor. He spoke earnestly against the false fundamental assumption that pauper labor is cheap labor. Mr. Atkinson's free-trade argument was listened to with the closest attention, though probably few in his audience shared his convictions. It was an earnest and eloquent speech by a gentleman whose opinions are entitled to respect, not alone for his individual work, but also because he is the representative of important interests.

Mr. Atkinson was followed by Mr. Thomas Doane, President of the Boston Society of Civil Engineers, who, in a humorous speech, frequently interrupted by applause, welcomed the Institute. After a brief response by the President, Mr. R. P. Rothwell, the business of the meeting was formally opened, Mr. James C. Bayles, editor of the *Iron Age*, reading an elaborate paper on the Microscopic Analysis of the Structure of Iron and Steel. Speaking of the importance of this line of investigation, now beginning to attract the attention which it deserves, Mr. Bayles says that, with only the laboratory and the testing-machine, the investigation of the structure and properties of steel moves in parallel lines, leaving between them unexplored fields. In them must probably be sought the information which shall connect the results of chemical and physical tests, and give to both a practical value which neither has yet been found to possess.

Among the recent contributors to the literature of the microscopical study of the structure of iron and steel is Herr A. Martens, of Berlin, whose results are recorded in a paper printed in the transactions of the *Verein zur Befoerderung des Gewerbfleisses*. Herr Martens claims to be confident that microscopical analysis will find a place as a rival of chemical analysis, though he acknowledges that, so far, he has not been able to obtain results which he would consider conclusive. He has used a microscope of special construction, and has devoted much attention to the preparation of specimens, the surfaces having been ground and finely polished, and then treated with acids so as to clearly develop the crystals and fibers in the metal. This preparation is said to require no great degree of skill. Martens, in the course of his investigations, found that the fractured surfaces of bars which broke under repeated use exhibited distinct features, clearly-defined portions of ellipses in some steels, and within each portion of them streaks, the prolongation of which beyond the ellipses ran in directions normal to the bounding surfaces of the broken pieces. He thinks that conclusions as to the use to which pig-iron and steel may be put may, in a great number of instances, be based upon examinations of this kind, and that the method will very often be found sufficiently trustworthy for all practical purposes.

Another valuable contribution to the literature of this subject was recently made by Dr. H. C. Sorby, of Sheffield, who prepared his specimens with weak acid. Dr. Sorby found that some of the constituents of the specimens are not acted upon at all by the acid, and others in varying degree. Thus some show the outlines of individual crystals very perfectly, while others develop a very close grooved structure, giving colors of varying brilliancy. The thorough determination of the exact nature of all the constituents seen in the various specimens would involve many years of careful chemical and microscopical investigation, since, though many of them differ very greatly in microscopical and physical character, their size is so small that it would be difficult or impossible to separate them in such a manner as to determine their chemical constitution. It would consequently be requisite to ascertain their true nature by careful induction from facts observed under special circumstances. Dr. Sorby has found various kinds of iron and steel to contain at least seven well-marked constituents, and has examined a large number of specimens with very interesting results.

Mr. Bayles then elaborately reviewed the conditions of success in the employment of the microscope in the examination of iron and steel. It requires a careful and thorough training of the eye, the proper preparation of the specimens, a correct choice of instruments and an inexhaustible fund of patience.

Dr. T. Sterry Hunt was then called upon for his paper on Coal and Iron in Alabama. Dr. Hunt described some of the more remarkable points in the geology of the coal region of Central Alabama, and showed the intimate and peculiar relations, both of the geology and geography of the region, to its economic interests. Dr. Hunt holds that the development in Central Alabama not only of a great coal trade, but of a vast iron industry, is certain in the near future, and has already begun. Dr. Hunt's general review of the geographical position of Alabama, and its mineral wealth, is of so much interest that we hope to give his paper in full in an early issue. The paper was briefly discussed by Mr. Rothwell, to whose earlier work in the same field Dr. Hunt repeatedly referred. Mr. Rothwell, in closing his remarks, called the attention of the Institute to the great services which the pioneer of that section of the country, Mr. Joseph Squire, of Helena, had rendered in studying and developing its mineral deposits.

After the election of a large number of members and associates, proving how much the Institute continues to thrive, the meeting adjourned.

THE SECOND SESSION.

The second session of the Institute was held in one of the rooms of the Massachusetts Institute of Technology, and was opened with a paper by Professor Richards, on the peculiarities of a block of tin obtained by smelting the residuum after distilling the amalgam. The block tin, after remaining quiet for a time, changed its surface entirely, crystalline spots appearing upon it. The tin held from 2·62 to 2·72 per cent of mercury. Dr. Hunt, during the discussion, referred to the molecular changes due to excessive cold, independent of impurities.

This was followed by Mr. H. W. Howe on a Suggested Cure for Blast-Furnace Chills."

Digitized by Google

Quite a lively discussion sprang up upon the subject presented; Messrs. Mattes, of Scranton, Constable, Rothwell, and Raymond taking part.

Prof. W. P. Blake, of New Haven, presented a summary of a paper on the metallurgy of nickel, in which he reviewed the history of the metal and its employment in the arts, the nature of the deposits in this country and abroad. He then went in detail into the manufacture and use of malleable nickel, referring at length to the work of Dr. Fleitman, and calling attention to the fact that Mr. Joseph Wharton, of Philadelphia, had for a number of years achieved a great deal in this way, and was now further developing it. Professor Blake had with him a very interesting series of specimens of sheets, bars, hollow ware, etc.

Mr. G. W. Maynard then introduced Mr. A. S. Bower, C.E., of St. Noets, England, who read the following paper:

THE BOWER-BARFF PROCESS.

Any process which has for its object the preservation of iron and steel from rust, and which will make these metals more applicable than they now are to the requirements of mankind, will be sure to meet with attention from members of this Institute, and from all those who are either engaged in the extraction of the ore, its reduction to metal, or the subsequent application of the metal itself.

It is, perhaps, not too much to say that, with iron and steel rendered secure against corrosion and decay, they will be used to an indefinitely greater extent than they now are. The whole realm of science has therefore been explored in the attempt to discover some method by which the formed article may be preserved, leaving its strength undiminished by the destructive action of rust. Paints, oils, varnishes, glazes, enamels, galvanizing, electro-depositing, and what is called "inoxidizing" are among the many systems now in vogue to effect the preservation of iron and steel from the corrosive action of air and water. The object of this paper is to show what may be done in protecting iron and steel from rust by forming upon their surface a film of magnetic oxide by an inexpensive process. It is no new thing to be told that magnetic oxide of iron is unaffected by exposure to the atmosphere or to salt water for any length of time. The black sand of Taranaki in New Zealand is a sufficiently good example of this. Dr. Percy has pointed out that the reason why Russian sheet-iron is less affected by exposure than ordinary sheet-iron is because of a coating of magnetic oxide; but this was not known until Dr. Percy discovered it. That such a coating is produced is quite certain, but it is only an accident of manufacture. To Professor Barff is due the credit of being the first to deliberately undertake to coat iron and steel with magnetic oxide, produced designedly for the purpose of protecting their surfaces from rust. Some sixteen or seventeen years ago, my father was making a series of experiments in the production of heating gases, one set of them being the decomposition of water by passing superheated steam through masses of red-hot iron. He noticed that the iron became less and less active until it ceased to decompose at all, when, on examining it, he saw that it was coated with a kind of enamel. It at once occurred to him, on seeing this, that the process in question might be used to obtain such a coating; but he found, after a few days' exposure of the iron to the atmosphere, that the coating shelled off, and he pursued the matter no farther. The iron employed in this case was rusty; but if it had been new, my father would in all human probability have been the accidental author of the process which Professor Barff discovered ten years afterward. I only mention this to show how advisable it is to investigate the causes of unexpected effects. Professor Barff's process consists in subjecting iron or steel articles to the action of superheated steam; and when they are at a temperature sufficiently high, three equivalents of iron combine with four of oxygen, forming one equivalent of magnetic oxide and setting eight of hydrogen free, or symbolically (1), $Fe_3+4(H_2O)=Fe_3O_4+8H$. Upon reading a description of the Barff process in the London *Times*, it occurred to my father that what the professor could effect with steam, he might also effect with air, and several experiments were made to this end, which, however, were very varied in character, as also were they in the results obtained. The first was made with cast-iron by placing the articles to be treated in a cast-iron retort heated externally, and then passing superheated air over them, and it was successful, while nearly all others afterward were quite the reverse, as sesquioxide was copiously produced as well as the magnetic. Another experiment was made by placing a bar of polished cast-iron in the main duct of superheated air to a blast-furnace, and this, though covered with a red sesquioxide powder and easily brushed off, had a thin but very firm and tenacious coating of magnetic oxide in contact with the iron. This bar has been exposed to the weather ever since, or over four years, without the slightest appearance of rust. Ultimately, when thinking over the fact that air is oxygen and nitrogen in mechanical combination only, I came to the conclusion that, to form the lower or magnetic oxide, the quantity of free oxygen and so of the air employed, must bear some proportion to the surface of the articles exposed to its action, more especially when a comparatively low heat is employed. This is so, and it has been proved that the quantity of air passed through the retort during most of the unsuccessful experiments was three or four hundred times more than was actually necessary. The reasons also why the first experiment was successful were, that a great number of articles were in the muffle, that a very high heat was employed, and that the retort had been previously used for coal-gas making, and had a deposit of carbon in it, which to a great extent neutralized the effect of the large excess of air.

All the unsuccessfully treated articles were red with sesquioxide outside; but there was nevertheless a coating of magnetic oxide in close proximity with the iron, due to the reducing influence of the metal in contact with the sesquioxide at an elevated temperature. The general appearance, however, of iron so treated was disagreeable, to say the least of it. The mode of action I then adopted was to admit a few cubic feet of air into the retort at the commencement of every half-hour, and then to leave the iron and air to their own devices, the retort of course being tightly closed. During each half-hour, a coating of magnetic oxide was formed, and the operation was repeated as often as was considered necessary.

Effective as this was for cast-iron, the cost of producing the coating was as great as by the Barff process; for both of them required that the chamber should be heated externally, and this, with large furnaces, is very expensive. Another plan that I adopted was to first find out approximately the extent of the surface of the goods to be treated, by first dipping them all into a tank of water of known area, lifting them out, and noticing the amount of water taken out of the tank by the wetted surface, and regulating accordingly a slow continuous air supply by meter, of course keeping the temperature of the muffle as nearly constant as possible. This, too, was successful; but the same objections applied to that mode of procedure as to the other.

There was commenced a series of experiments with carbonic acid, chemically produced by the decomposition of chalk, the idea being that three equivalents of iron would unite with four of carbonic acid, forming one equivalent of magnetic oxide, and four of carbonic oxide, if the heat were sufficiently high. This reaction is expressed symbolically thus: (2) $3Fe+4(CO_2)=Fe_3O_4+4(CO)$. This is the simplest action that could take place; but it was evident, from the results, that something quite different was obtained, inasmuch as the coating was very light in color, pleasing to the eye, but easily removed, and in that sense entirely differing from the articles you see before you. This coating, from effects exactly similar and designedly produced by a studied manipulation in the furnaces in successful operation in England, France, and here, proves pretty conclusively that carbonic acid, practically pure, produces upon iron, at an elevated temperature, a film which is, in composition, a mixture of FeO and Fe_3O_4, or, at all events, it is nearer the metallic state than is magnetic oxide. But even supposing that the results obtained by the carbonic acid had been successful as then carried out, the objections referred to concerning the air process would still exist, as external heat and a closed iron muffle would always be necessary. I therefore proposed to use a fuel-gas producer, similar in principle to the Siemens generator, but altered practically to suit other requirements, to burn the combustible gases thus produced with a slight excess of air over and above that actually required for perfect combustion, and to heat and oxidize the iron articles placed in a suitable brick chamber by these products of combustion. I also arranged a continuous regenerator of fire-clay tubes underneath the furnace, so that the products of combustion leaving the oxidizing-chamber passed outside the tubes, imparting a portion of the waste heat to them, which was taken up by the ingoing cold air passing through their interior on its way to the combustion-chamber. I had hoped in this way to be able to so regulate the excess of air over that required for complete combustion as to be able to produce magnetic oxide directly, instead of the lower and useless oxide or combination of oxides produced by carbonic acid alone. I obtained some beautiful results, and some again were unaccountably bad, and I soon found that it was as difficult to regulate the precise amount of oxidation as it first was in the Bessemer process, and I was fortunate enough to hit upon an almost parallel remedy, that is to say, I increased the quantity of free oxygen mixed with the products of combustion, and oxidized the iron articles to excess during a fixed period of generally forty minutes, when magnetic oxide was formed close to the iron and sesquioxide over all. Then for twenty minutes I closed the air inlet entirely, leaving the gas-valve open, and so reduced the outside coating of sesquioxide to magnetic oxide by the reducing action of the combustible gases alone. The excess of oxygen in the first instance produces Fe_2O_3 or sesquioxide of iron; and the under surface of this, being in contact with metallic iron, undergoes reduction to magnetic oxide in the following manner: four equivalents of sesquioxide unite with one of metallic iron, forming three equivalents of magnetic oxide, or symbolically (3) $4(Fe_2O_3)+Fe=3(Fe_3O_4)$.

When deoxidizing by combustible gases, consisting mainly of carbonic oxide, three equivalents of sesquioxide unite with one of carbonic oxide and form two equivalents of magnetic oxide and one of carbonic acid and symbolically (4) $3(Fe_2O_3)+CO=2(Fe_3O_4+CO_2$. Another method of reduction is by carbon itself, when the formula stands thus: (5) $3(Fe_2O_3)+C=2(Fe_3O_4)+CO$.

Formula (4) is also the reaction when rusty iron is reduced by producer gases, which consists largely of carbonic oxide, and by the specimens exhibited it will be seen that articles completely pitted with rust may have their surfaces rendered rustless. In this case, the periods of oxidizing and deoxidizing are reversed, that is to say, the latter occupies forty and the former twenty minutes. No oxidizing is theoretically necessary, but practically a certain amount is requisite to keep up the heat in the chamber, which of course could not be done unless combustion took place some time or other. I only mention the reduction by carbon as exemplified by formula No. 5 because, while experimenting with a furnace, I was asked by the proprietors of a valuable red oxide deposit which was found in so finely divided a state as to be capable of being used at once as a paint, whether I could reduce it to a magnetic oxide. I tried to do so by carbonic oxide; but I found that only the surface of it was affected, and that even this, when taken out of the furnace, speedily returned to its original red color by the combined actions of the unconverted material underneath and the air above. It will be found from formula (5) that 2¼ pounds of carbon are required to reduce 100 pounds of red oxide. This I mixed intimately in the shape of powder with the red oxide, brought the mixture to a red heat, and the result was black magnetic oxide. Not only this, but by adding more carbon I could make the color lighter and lighter until it was almost identical with the coating produced in my previous experiments with carbonic acid, and by reducing the quantity of carbon below 2¼ per cent, various shades of purple were obtained, the red appearing more and more prominent as the quantity of carbon was diminished. It will be as well, before I make any comparison between Professor Barff's process and those patented by my father and myself, to state that the whole of the professor's patents, wherever existing, have been purchased by my father, so that in this case, at least, I hope you will not say that "comparisons are odious." Professor Barff's process is better than ours for wrought-iron and perhaps for polished work of all kinds, as iron commences to decompose steam at a very low temperature, in fact, much below visible redness. Only the other day, at the annual meeting of the Association of American Stove Manufacturers, held in New York, I was asked whether stove patterns might not be made of cast-iron, polished, and then oxidized. Here is one among many instances where the steam process is almost invaluable. For ordinary cast iron, and especially that quality which contains much carbon, the Barff process is much too slow in its action, and some specimens that I have treated in England have taken as much as thirty-six hours to coat effectually, which could readily have been finished off in five hours by the Bower process. The main distinction between the two is

Digitized by Google

that the Bower is much more energetic in its action than the Barff process. The carbon in cast-iron impedes oxidation, and so, while cast is far more readily treated in the Bower furnace, wrought-iron is apt to scale unless it is rusted beforehand. The rust then eats into the metallic surface under the influence of heat, and forms a tenacious combination with it. The objection to the use of a closed muffle externally heated in the Barff process has been almost entirely overcome by simply putting wrought-iron into a Bower furnace, previously well heated, then shutting off both the gas and air supplies, and admitting steam into the regenerator tubes. The steam thus passes through the red-hot tubes, then through the combination-chamber and its contingent passages already highly heated, over the articles in the oxidizing-chamber, heating and oxidizing them, and thence over the outside of the regenerator tubes, depositing a great portion of its heat there before passing to the chimney, and which is again picked up by the in-going fresh, cool steam. In this way, the heat in the chamber is highest shortly after the commencement of the operation, and gets gradually lower during the time of exposure, which varies according to the class of goods from five to ten hours. At the close of the operation, just before the articles are taken out, every thing is moderately cool, and this for steam is the perfection of action, as stated by Professor Barff himself. Steel, I consider, can be equally well treated by both processes, and, indeed, it is natural to expect this, steel being, so far as the quantity of carbon it contains is concerned, between cast and wrought-iron. Polished steel, however, is better treated in a low temperature Barff furnace. With regard to the quality of fuel burnt in the gas-producers, a non-coking gas-coal is the best, and Virginian splint has suited very well in this country, and of this about one ton every three days is required for a furnace with an oxidizing-chamber 13 feet long, four feet three inches wide, and four feet three inches high. When a gas-coal is employed, it should be fed through the charging-hoppers just before each deoxidizing operation, when a smoky flame is of great advantage. I have, however, discovered that anthracite can be used as well as a gas-coal by simply allowing petroleum to drop at the rate of one gallon per hour upon the red-hot surface of the coal in one of the gas-producers. This method has been exclusively used in the coating of the articles exhibited in this room at the works of Messrs. Poulson & Eger, architectural engineers, at North Eleventh and Third streets, Brooklyn, E. D., N. Y., to whom I am much indebted, not only for these beautiful castings, but for the constant courtesy and energy they have always exhibited during the erection of their furnaces. At present, they have two erected, one a Bower furnace, of the size before mentioned, and the other a small Barff furnace for the treatment of very delicate or polished articles. These magnetic oxide processes not only protect from rust, but the coating is of such a beautiful color as to render articles ready for the market as soon as they are out of the furnace and cooled. One remarkable feature of them is, that there is no more cost (except in the labor of handling them) in treating 2240 articles, each weighing a pound, than there is in coating a cube of metal weighing a ton; and so penetrating is the process that, no matter how intricate the pattern may be, every crevice—which it would be almost impossible to get at with a paint-brush—is as effectively coated as the plainest surfaces, as will be observed by examining the specimens exhibited in this room. For art purposes, the French gray color, with shades approaching to black, might not always be suitable; but if it should be necessary to use paint on the iron so coated, there is the absolute certainty that it will remain on in the same way as it does on wood or stone, and thus iron may be used for constructive work in a thousand directions in which it has not, up to the present time, been possible on account of its liability to rust, no matter what the coating used to protect it has been. I can give an instructive instance of this. A company in Paris had expended a very large sum over Dodé's inoxidizing process, which process consists in the depositing of a layer of borate of lead on iron or steel, and then gilding, platinizing, or bronzing them, and certainly the articles so treated were exceedingly beautiful to look at; but the iron ultimately rebelled and threw off the coating, so that the shareholders were in a fair way of losing all their capital, when it was suggested to the directors that, if their compositions could be deposited directly upon magnetic oxide, they would conquer the difficulty. They then applied to my father for specimens of coated iron to experiment upon, and they were so satisfied with the result that the company purchased all our European patents except for England, and is carrying on the combined processes on a large scale. It has, besides its furnaces for the Dodé process, 4 large Bower ones, two being 36 feet long by about 6 feet 6 inches wide and 6 feet high, and a Bower-Barff furnace, also of large size. Others, however, are in course of erection. Engineers and manufacturers appear far more ready to apply the processes here and on the continent of Europe than up to the present time they have been in England; but perhaps the reason has been that, so far as Professor Barff's process is concerned, it has only just been shown how large masses can be dealt with, namely, by the use of the Bower furnace; and I can show that for the treatment of underground pipes, wrought-iron sleepers, roofing, and the like, the process can be readily applied, and at a cost much less than that of galvanizing, and it will at the same time be infinitely more durable; while for ornamental cast and wrought-iron, it is scarcely possible to imagine any thing more artistic in color than some of the articles after they have been treated. For ordinary hollow ware for kitchen use, whether of cast or wrought-iron, this process is admirably adapted; and though I have been told that the gray or black color will probably be objectionable, yet I imagine, if it can be shown, as we can do, that the magnetic oxide is more durable, more easily cleaned, and much cheaper than even the common tinted article, a market will soon be created. Any how, the new combined processes are so far developed, and they have been so thoroughly examined by scientific and practical men both here and in Europe (whose testimony to the value and efficacy of them is voluminous), that they have passed from the region of theoretical investigation into that of practical application, and means have been taken for establishing works in different centers in Europe, as will also be done here, for the purpose of coating iron and steel as a trade operation. One firm alone in Scotland, Messrs. Walter Macfarlane & Co., have adopted the process, their output of ornamental castings per *day* exceeding 100 tons! It is intended to apply the processs to cast-iron gas and water-pipes; and as the former have comparatively no pressure to bear, they may be made much lighter than they now are, if rendered incorrodible; while for water, it will be a great advantage to have both the main and service-pipes rendered safe from rust, which not only discolors the water, but forms the nucleus of very troublesome deposits. There is no reason now why wrought-iron or mild steel pipes should not be used for the same purposes, especially for the interior towns of distant countries, where the first cost of the pipes is but small as compared with the cost of carriage. My father has himself used gas and water-pipes where the cost on arrival at their destination has been five times greater than their first cost in England. If, then, light wrought-iron or steel pipes could be used, not weighing one third of those made of cast-iron, and rendered practically indestructible, what an enormous saving will be effected! Again, in the case of railroad sleepers in iron and steel, which are now almost wholly used in Germany, the process is likely to prove of much advantage, so at least I am told by engineers, both in Belgium and in Germany; and if there, why not here? For fountains, railings, and all architectural work, the process is invaluable, and iron may now be used in many instances instead of bronze. It will naturally be asked, what is the cost of the process? I can not do better than answer the question by quoting from the report of Professor Flamache, the engineer-in-chief of the state railroads in Belgium, who was sent over specially to England to report on the process by the Public Works Department of that country. His estimate of cost, after a very careful examination and testing of the process, was 7½ francs per 1000 kilos, or nearly two dollars per ton—at, of course, the Belgian rate of expenses. He also gives the cost of coating a certain extent of surface, but this I consider to be completely valueless, as, for example, I have had a furnace full of 56-pound weights and another time I have had it full of gas-governor tops, the surface in the latter case being perhaps one hundred times more in extent than in the former, while the actual cost of oxidizing would be the same in both cases. He also says that this cost may be reduced, as instead, of one workman attending to one furnace, he can attend to three or four; also by a better system of taking the articles out than existed in the experimental furnace that he saw. Sir Joseph Whitworth, feeling much interest in Professor Barff's process, sent to him some steel to be oxidized, so that he might ascertain whether it did or did not lose in strength by the operation; and the result of Sir Joseph's testing was, that there had been no alteration whatever. Theoretically, one would rather expect that iron and steel would be somewhat toughened, as the tendency of the process is to anneal, and would, no doubt, if continued long enough, render some classes of cast-iron malleable. A very thin article, if excessively coated, might probably be weakened, due to the fact that the coat of magnetic oxide would form an appreciable percentage of the bulk of the article; but this, of course, is a very extreme case, and one which is not likely ever to occur in practice. The development of these processes has been a very long and tedious business, and one requiring much faith and patience in the midst of most disheartening failures for months together; but to gentlemen connected with the iron and steel industries and who know well that results are only obtained by patient and well-directed toil, I need not dwell on this, as almost every man who has had to reduce theory to practice has had abundant experience of the same kind.

THE LEAVITT SEWAGE PUMPING ENGINES.

In the afternoon, an excursion was made to the sewage pumping engines, designed by Mr. E. D. Leavitt, Jr., one of the two engines now in place being run, pumping sea-water, for the special benefit of the members of the Institute. They are compound vertical engines, having the steam-cylinders placed above the two pumps, the connecting-rods of the engines being attached to a walking-beam, which is connected with the fly-wheel. The high-pressure cylinder is 25½ inches in diameter, and has a nine-foot stroke, while the diameter of the low-pressure engine is 52 inches. The steam is carried to the high-pressure cylinder by a ten-inch supply-pipe, the engine being designed to work with an initial pressure of 100 pounds, cutting off at about 22 per cent of the stroke. In passing from the high pressure to the low-pressure engines, the steam flows by 960 five eighths inch brass tubes, through which live steam circulates. By this means, which Mr. Leavitt has also used in the famous "Superior" engine at the Calumet & Hecla mine, any moisture in the steam caused by the expansion in the high-pressure cylinder is removed and the steam is dried. It enters the low-pressure cylinder at a pressure ranging between 20 and 25 pounds, and is cut off at about one half of the stroke. The automatic governor, which is of a design patented by Mr. Leavitt, is controlled by a governor which can be run at any speed. The fly-wheel is 36 feet in diameter and weighs 36 tons. The pumps have 48-inch plungers and specially designed rubber valves with metal backing, having a high lift in order to allow the passage of large substances that are liable to get into the sewage. The bottom of the sewer is 14 feet below low water, and the maximum lift is 43 feet. It is not expected, however, that the average lift will exceed 37 feet. The nominal speed of the engines is eleven revolutions per minute, and at that speed delivers 25,000,000 gallons. At the time of the visit of the Institute, the one engine was running at 16 revolutions and was delivering at the rate of 36,000,000 gallons. The engine had not, since put up, run more than 24 hours all told, and was not at its best. They were built by the Quintard Iron-Works, of this city.

Steam is to be supplied by four steel boilers rated at 250 horse-power each, built by Kendall & Roberts. Every steel plate used was tested, the specifications being an elastic limit of 37,000 pounds, and ultimate strength not more than 65,000 pounds nor less than 60,000 pounds, and an elongation of not more than 20 per cent, nor less than 10 per cent. The boilers are 80 inches in diameter, of $\frac{7}{16}$-inch double riveted steel, the fire-box being made of $\frac{5}{16}$-inch steel. They have 132 three-inch tubes 15 feet long. The feed water is heated by the waste gases in a heater containing 1000 feet of 2-inch brass pipe, the average temperature of the feed being carried up to 180 degrees Fahr. The boilers, of which there are four, are covered with a mixture of one part plaster of Paris and two parts of sawdust held in place by straps.

THE NORWAY IRON-WORKS.

At the Norway Iron-Works, one of the most interesting subjects studied was the use of petroleum as a fuel in various furnaces in the iron-works, the device used being that developed and introduced by the Vapor Fuel Company, of Washington. We are informed that for several years the managers of the Norway Iron-Works have been experimenting in this direction, and believe that now, after numerous changes in plant and detail, they have succeeded in so simplifying and cheapening it that it is

Digitized by Google

preferable to the usual system of heating with gaseous or solid fuel. The petroleum is forced by a small pump into a cast-iron tank, which contains a receptacle to which a large surface has been given by alternate contraction and swelling of the section, by deep corrugation. Upon the surface of this interior receptacle, the petroleum drops in a small stream. Through the interior of the corrugated receptacle passes live steam, which issues from an orifice in the bottom in a superheated condition, mixing with the vaporized oil. The entire cylindrical tank is heated by a special fire-place, and the mixture of superheated steam and vaporized petroleum is directly carried by pipes to the furnaces where it is used. It is stated that no trouble is experienced by the formation of the solid, firm coke which has wrecked so many kindred devices.

Oil as a fuel has just been introduced to run a scrap-heating furnace, in which the two-ton charges are put through in twenty-five or thirty minutes. This heating furnace has regenerators at both ends, and the work it does, so far as can be gathered from its short run, is pronounced satisfactory. Near this reheating is a double puddling-furnace, also heated with oil, it having a capacity of from 12,000 to 15,000 pounds of pig, from four to five heats being got out of the furnace per ten-hour shift, or more than two single ordinary puddling-furnaces near by with a capacity of from 475 to 500 pounds of pig each. It should be stated that all of these furnaces are worked more for high quality than large production. A third furnace heated with oil is used for reheating open-hearth steel ingots. It is not provided with regenerators, the heat being utilized for making steam in a boiler overhead. For this purpose, too, the oil heating appears to give satisfaction.

The steel-mill of the Norway Iron-Works contains what is said to be one of the most successful open-hearth plants in the country, each of the three ten-ton furnaces averaging from 20 to 22 heats per week. Much attention appears to be paid to the careful preheating of the scrap used, a small heating furnace serving the line of three steel furnaces. Another feature of interest in connection with them is the casting arrangement. The steel is run into a ladle mounted on a swinging crane; and in order to do the casting as rapidly as possible and yet as quietly as practicable, the ingots, placed in a small pot, are grouped in nests of four and six. On top of each of the nests is placed a tank into which the steel is, passed, and from which it flows simultaneously into all of the ingots through four and six orifices respectively in the bottom of the tanks. The bulk of the steel made appears to be used for boiler plate. The ingots are rolled down to slabs in twelve passes in a two-high train, the slabs going to the Bay State Iron Company for further working. For various shapes, the steel is rolled in a three-high train down to 6-inch square. The mill has besides two trains for wire rods and small shapes, one train for carriage springs, one 10-inch train for shapes, a 13-inch train for spring steel of various shapes, three 18-inch trains for shapes and steel billets, and a sheet mill.

A very interesting, though small, department of the mill, is that in which the cold drawing process, patented by Mr. G. H. Billings, is carried out. Steel of various sizes and shapes is drawn cold through a die, the bars being afterward straightened. There are two machines, one with a 16-inch cylinder, and a smaller one with a 7-inch cylinder, both being capable of handling 24-foot bars and rods. We shall refer to this process and its results at greater length in a future issue. Suffice it to state now that a large variety of small and large sizes are made, which are largely used by machine builders in New England. The process has been quietly and steadily developed, and need only be more widely known to be appreciated.

After a brief visit had been paid to the Carson sewer excavating apparatus, which has for a considerable time been in practical operation in Boston, the party returned to headquarters.

THE THIRD SESSION.

The evening session was opened with a paper by Prof. W. C. Kerr, on the Geological Relations of the Topography of the South Appalachian Plateau, followed by a summary of what we learn is a very elaborate paper by Dr. T. Egleston, of the Columbia School of Mines, on the Collection of Flue-Dust at Ems. We have in our issue of July 1st, 1882, given a summary of the results at that time gathered at Ems. Since then they have been confirmed in later runs, and some additional details of interest have been developed. Prof. R. H. Richards, of the Massachusetts Institute of Technology, then exhibited some interesting experiments showing the lines of weakness in cylinders. This was followed by a valuable and elaborate paper by Mr. A. F. Hill, on the Shop Treatment of Steel. We can not do justice to it in a hurried abstract, and shall present Mr. Hill's experiments and the deductions he makes from them in a more extensive form in an early issue. The paper was discussed by Mr. R. W. Hunt, of Troy, who called attention to the use of the step punch.

On Thursday morning, the members were driven to Watertown in two parties, where the wonderful testing-machine built by Mr. A. H. Emery was fully described by Mr. Howard, who has charge of the work. We regret that, pending the issue of foreign patents, we can not, as we were prepared to do, print an illustration and a detailed description of the machine. After witnessing the testing of a steel bar made at the Norway iron-works, the party drove to Cambridge, where a few hours were spent in visiting Harvard Hall, the College Library, Hemenway Gymnasium, the Physical Laboratory of the Lawrence Scientific School, the Museum of Comparative Zoölogy, Memorial Hall, Boylston Hall, the Chemical Laboratory, and the Mineral Collection, a lunch was partaken of in Memorial Hall.

THE FOURTH SESSION.

A brief session was held in Boylston Hall, Prof. S. P. Sharples reading a paper on the Strength of American Woods, in which he presented the result of a large series of tests and experiments made under the auspices of the Census Bureau, and partly published by it in bulletins Nos. 18 and 22.

Before the close of the session, Professor Cook, of Harvard University, showed in a beautiful manner the "critical point" observed in heated liquid carbonic acid at a blood temperature. The carbonic acid was seen to expand rapidly as heat was applied, the surface of the liquid gradually becoming indistinct and nebulous and finally being impossible to trace.

In the evening, nearly two hundred ladies and gentlemen sat down to the subscription-dinner at the Brunswick Hotel.

THE QUALIFICATIONS OF BLAST-FURNACE COKE.

Mr. John Fulton, mining engineer of the Cambria Iron Company, a gentleman who has closely studied the question of the qualifications of coke as a blast-furnace fuel, has recently written as follows to the Connellsville *Keystone Courier*:

My attention has been called to a friendly controversy now pending between the editors of the *Keystone Courier*, of Connellsville, Pennsylvania, and *The Virginias*, of Staunton, Virginia, on the important industrial question of the relative merits of Connellsville and West Virginia coke, for blast-furnace use, in the manufacture of Bessemer pig-iron.

I understand the grounds taken by the parties in this discussion rest upon the evidence of chemical analyses, especial emphasis having been laid on the relative volumes of *phosphorus*, the *Courier* asserting that the Virginia coke holds a larger percentage of this dangerous element than the Connellsville.

On the other side, *The Virginias* denies this, and submits analyses by Prof. A. S. McCreath, Chemist of the Second Geological Survey of Pennsylvania, showing less phosphorus in the West Virginia coke. Neither party questions the accuracy of the chemical analysis of these cokes, but there are objections to the manner of quoting the results. *The Virginias* submits Professor McCreath's analyses in Report MM, page 127, as showing 0·0344 per centum of phosphorus in Connellsville coke—the same authority finding only 0·008 per cent of phosphorus in the New River, West Virginia coke.

It will be noted that Professor McCreath does not say that the twenty-four coals examined by him from the Pittsburg coal-bed were all from the Connellsville region. This large Pittsburg bed covers an extensive corner of the State on its southwest side. The inquiry now is confined to the Connellsville coal and coke region—not designed to embrace all Southwestern Pennsylvania. Now in Report MM, in coke from the large establishments of Messrs. Dravo, Frick & Company, which afford prominent types of Connellsville coke, the phosphorus is given at 0·014 per cent.

A recent and exhaustive test for phosphorus has been made from a large sampling of the coke made at the extensive works of the Cambria Iron Company, near Connellsville, selected by John McFadyen, superintendent of coke department, by Prof. T. T. Morrell, chemist, showing only 0·01 per cent of phosphorus. J. Blodget Britton, chemist, Iron Masters' Laboratory, Philadelphia, in his analysis of the coke quoted by *The Virginias*, shows 0·027 per cent of phosphorus.

We have, therefore, two determinations by different chemists of Connellsville and West Virginia cokes, as follows:

	Connellsville.	West Virginia.
A. S. McCreath	0·014	0·008
T. T. Morrell	0·010	.....
J. Blodget Britton	.....	0·027

Showing an average of phosphorus in Connellsville coke of 0·012, and in West Virginia 0·0175. Both these cokes are low in phosphorus, and the slight difference in favor of Connellsville should not alone afford evidence of its superiority.

The following analyses of these cokes will show their relative composition:

	Connellsville.	West Virginia.
Moisture	0·030	0·110
Volatile matter	0·460	0·350
Fixed carbon	89·576	92·181
Sulphur	0·821	0·618
Phosphorus	0·014	0·027
Ash	9·113	6·680

From the above, it will be readily seen that there are no large differences except in the ash, which is somewhat greater in Connellsville. This difference would not afford grounds for a claim in favor of West Virginia coke; for it will be shown that, while purity is one of the prime factors in superior coke, yet there are other vital considerations that decide the value of this fuel for metallurgical purposes. The inquiry is here pertinent: What constitutes superiority in coke for blast-furnace use in producing Bessemer pig-iron?

In the preparation of coke for blast-furnace use, four conditions are regarded as essentials:

1. Hardness of body. 2. Well-developed cell structure. 3. Purity. 4. Uniform quality of coke.

I. HARDNESS OF BODY.—The best coke must possess hardness of body or cell-walls—not density, for dense cokes are frequently soft or punky, while hard cokes generally afford a well-developed cell structure. These two physical properties, hardness and full cellular spaces, are correlated, just as softness and density are associated.

The prime requirement of hardness of the body of coke will be evident, when the conditions of its combustion in a blast-furnace are considered. In its movement down the furnace, from the charging-plates to a short distance above the tuyeres, it is enveloped in a current of hot carbonic acid gas. This gas possesses the power of dissolving carbon or coke, and is especially destructive to the soft variety. Every pound of coke dissolved by this gas in the upper section of the furnace is a double loss, by the reduction of temperature where the action takes place, and in the loss of a pound of fuel, which should have been burnt near the tuyeres. I. Lowthian Bell has shown by direct experiment that all forms of carbon are not equally easily affected by carbonic acid; that hard coke is capable of resisting its solvent action much more than soft coke; the latter suffering by dissolution, during a test of thirty minutes, six times the loss of the former. (Bell's *Iron Smelting*, pages 413, 414.)

The value of a coke in a condition of hardness in which it is least susceptible of being oxidized in the region of the furnace where its combustion proves a double loss needs no further emphasis.

II. WELL-DEVELOPED CELL STRUCTURE.—Next to hardness of body in coke, a well-developed cell structure is second only in importance. This arises from the fact that, other things being equal, the calorific energy of a fuel is in proportion to the surface exposed to the oxygen of the blast in the region of the tuyeres. Hardness with density of physical structure as found in anthracite, which is a natural coke produced under great pressure, illustrates this position conclusively by the actual work. The following records illustrate this difference in density, with corresponding results in blast-furnaces running on Connellsville coke and anthracite coal:

Connellsville Coke.

The run of the Carnegie Brothers & Co.'s Edgar Thomson E furnace,

Digitized by Google

at Pittsburg, for the three weeks ending November 11th, was 1465 tons, 1629 tons, and 1540 tons respectively. This output was on 54 per cent ore, and was made on one pound of coke to one pound of iron. Their D furnace has made 299 tons in one day, 1840 tons in seven, and 7332 tons in 31 consecutive days. The ton used is 2268 pounds.

Anthracite Coal.

The yield of pig-iron at Colebrook furnaces during the week closing Saturday, December 16th, was 577 tons at No. 1 furnace and 575 tons at No. 2 furnace. The total yield for the week from both stacks was 1152 tons. No. 1 furnace has been in blast fourteen weeks, and has produced in that time 6446 tons of pig-iron, averaging 460 tons per week. No. 2 furnace has been in blast five weeks, and produced in that time 2389 tons, averaging 478 tons of pig-iron per week. Cornwall ore was used exclusively; the fuel used was anthracite. These are the two new furnaces of Robert H. Coleman, at Lebanon, Pa. No: 1 is 55 feet high by 14½ feet in diameter; No. 2 is 80 feet high and of the same diameter as its mate. The ton used contains 2250 pounds. (*Iron and Steel Bulletin.*)

Without insisting on the very large product of these coke-furnaces, it is submitted that, other conditions being equal, the average energy of these fuels would be represented as follows:

Coke, furnace, 800 tons of pig-iron per week.
Anthracite, furnace, 500 tons pig-iron per week.

This exhibits a relation of Connellsville coke to anthracite coal of 8 to 5. A careful test of two cokes differing in density, made at Conemaugh furnace, showed a loss of 11 per cent in product arising from the denser coke alone.

The following table will illustrate the physical properties of Connellsville, West Virginia, and other cokes for general comparison:

Physical Properties of Cokes.

Locality.	Grams in one Cubic Inch.		Pounds in one Cubic Foot.		Per-centage.		Compressive strength per cubic inch (¼) ultimate strength.	Hight of furnace charge, supported without crushing.	Order in cellular space.	Hardness.	Specific gravity.
	Dry.	Wet.	Dry.	Wet.	Coke.	Cells.					
Connellsville	12·46	20·25	47·47	77·15	61·53	38·47	284	114	1½	3·50	1·500
West Virginia	13·76	21·19	52·44	81·56	64·32	35·67	258	103	1	3·15	.....
Broad Top	11·76	20·18	44·81	76·88	58·27	41·73	240	96	1	3·35	1·342
Clearfield	14·79	19·86	56·35	76·69	74·43	25·57	315	128	1	3·60	1·560
Cumberland	12·76	21·63	48·61	82·41	58·99	41·01	215	86	1½	3·00	1·750
Alabama	13·30	18·29	50·70	69·01	73·17	26·23	225	87	1	3·50	1·493
Illinois	11·06	17·09	42·02	65·09	63·79	36·21	180	70	1	3·20	1·215

Chemical Analyses of Cokes.

Locality.	Fixed carbon.	Moisture.	Ash.	Sulphur.	Phosphorus.	Volatile matter.	Remarks.
Connellsville	89·57	0·30	9·11	·820	·014	·460	Chem. analysis, Prof. A. S. McCreath.
West Virginia	92·18	0·11	6·68	·618	·027	·350	Chem. analysis, J. B. Britton.
Broad Top	89·28	.....	8·66	1·060	.....	.....	" " T. T. Morrell.
Clearfield	89·86	0·54	9·41	.....	·667	.....	" " Booth, Garret & Blair.
Illinois	89·77	0·12	9·58	0·930	·033	.....	Good coke, T. T. Morrell.

From a careful inspection of this table, which affords a wide range of typical cokes, it will be seen that, while some approximate very closely to Connellsville in certain physical and chemical properties, yet no one inherits so many essential requisites in equal degree with it.

III. PURITY.—It has not come under the writer's observation that any comprehensive law has been eliminated, from reliable determinations, locating the greatest volumes of sulphur or phosphorus in any special zone of the Appalachian coal-field. Sulphur, free or combined with iron, is mainly found in the coal slates. In some instances, these slates are interleaved in very thin plates with the coal, so as to render washing unsatisfactory. In other coals, the pyrites are found in lenticular pieces, which are readily removed by crushing and washing. Hence it follows, in a general way, but not always, the more slate the more sulphur. Mr. McCreath has shown that twenty-five coals examined, containing an average of 2·138 per cent sulphur, yielded cokes containing an average of 1·912 per cent of sulphur.

Phosphorus is a more difficult element to locate. The inquiry as to its relative volumes in the coal and its slates will probably be answered when Prof. J. P. Leslie arranges the valuable data now collecting in the Second Geological Survey of Pennsylvania. Mr. Britton found in two samples of anthracite coal for furnace use, ash, 10·43; phosphorus, 0·049: and ash, 5·29; phosphorus, ·0354. In examining two semi-bituminous coals, he found in one, ash 5·03; phosphorus, ·0085: and in the other, ash 4·94, and phosphorus only a trace. (American Institute of Mining Engineers, Vol. I., page 298.) In a recent series of tests for phosphorus in brown hematite iron ore, an average of ·099 was found in clean ore, ·068 in the clay in the ore, and ·012 in the rock matter associated with the ore.

One general principle may be safely deduced from the foregoing data: That, other things being equal, the less ash in the coke, the less risk of sulphur or phosphorus in dangerous volumes in the resultant pig-iron from the furnace. In many cases, there is danger of injuring the physical condition of coke by the operation of washing the coal to reduce its slate. The washing of some coals improves the coke; in others, it injures it.

In the discussion of this matter at the Hazleton meeting of the Institute of American Mining Engineers, in 1874, "Mr. Bell further remarked, as to the relative value of coke made from washed and unwashed coal, he was of the opinion that coke made from coal that did not require washing was superior to that made from washed coal." (Vol. III., p. 182.) Washing coal carries out in the operation valuable hydrogenous matter which aids in developing cell structure. The coke made from it would be more dense; in other words, in many cases, the loss in calorific energy by the density in the coke for washed coal would more than overtop the advantage of a reduction of ash, except in cases where ash is excessive.

IV. UNIFORMITY OF QUALITY IN COKE.—This is one of the essential requirements, in view of the destructive action of carbonic acid gas on soft coke. The "black-ends," which are sometimes made in coking, are worse than useless in a blast-furnace, and, if reckoned in the fuel charge, must produce bad results. Hence, a carefully prepared coke, alike all through, is most desirable for regular work in blast-furnaces. This result can be best obtained from coal similar to the Connellsville, inheriting a liberal ratio of hydrogenous matter to assure full oven heat and thorough coking in every part of the charge. This is one of the distinguishing features of Connellsville coke.

The Connellsville coal region is a separate prong of the Upper Coal Measures resting along and near the western foot of Chestnut Ridge. It is two or three miles broad and sixty miles long. The coal-bed is from eight to ten feet thick, affording a bright, soft coal in thin-sliced vertical plates. The "Pittsburg bed," as it is pursued east to Salisbury and Cumberland, affords a coal lower in hydrogenous matter and yields a coke inferior to Connellsville. Westward, the excess of pitchy matter in the coal leads to an inflated physical structure in coke.

It is thus evident that the Connellsville coal embraces in a larger degree than any other at present developed the properties that make excellent coke. Its coal requires no washing and no special arrangements for coking. Its coke has grown in the confidence of furnace managers until it has now attained the distinguished position in America which the celebrated Durham coke enjoys in England.

ACCIDENTS IN ANTHRACITE COLLERIES.

A correspondent of the New York *Sun* has been gathering the statistics of accidents in anthracite collieries, and his report is of interest as showing what conclusions an intelligent outsider reaches. We are far from indorsing all he says; but his opinions are worthy of being put on record:

It is somewhat startling to think that during the last year no less than 300 persons were killed and more than 1000 injured in various ways at the peaceful calling of mining anthracite coal in Pennsylvania. Yet this is the thrilling record. There are six anthracite mine inspectors in Pennsylvania, provided for by law and paid from the State treasury, to see that the provisions of the Mine Ventilation act, which was brought forth by the Avondale horror, are enforced. These inspectors are stationed in various parts of the State, and to their courtesy I am indebted for the figures which I have quoted. Only one of the reports given below is unofficial, namely, that of Inspector Ryan of the Shamokin District. The following is the frightful record of the anthracite region for 1882:

	Killed.	Injured.
Inspector Williams, of Wilkes-Barre, reports	73	185
Inspector Broderick, of Hazleton, reports	40	130
Inspector Gay, of Pottsville, reports	20	94
Inspector Mauchline, of Shenandoah District, reports	40	167
Inspector Blewitt, of Scranton District, reports	77	288
Inspector Ryan, of Shamokin (estimated)	50	150
Totals	300	1,014

Of the accidents reported by Inspector Williams, of Wilkes-Barre, 10 persons were killed and 49 injured by explosions of gas, 22 were killed and 49 injured by falls of roof and coal, 4 were killed by falling down the shaft, 16 were killed and 39 injured by mine cars, 8 were killed and 12 injured by explosions of powder, 8 were killed and 18 injured by "miscellaneous causes," and 5 were killed and 17 injured by accidents of various kinds outside the mines. Of the 94 persons injured in the Pottsville District, 11 had legs or arms broken, and a large proportion of the others met with serious wounds. In the Shenandoah District, Mr. Robert Mauchline reports that 15 persons were killed by fall of roof, 7 by the cars, 7 by explosions of gas, 2 by powder, 3 on the slopes, and the others in various ways. In the Scranton District, of which Mine Inspector Blewitt has charge, most of the serious casualties of the year are due to falls of roofs in the mines, which is often the result of inadequate propping. Many of the men who were killed leave large and helpless families, and the condition of those little homes in which men are sadly maimed is almost as pitiful.

As an illustration of the class of accidents coming under the heading of "serious injuries," I will cite a case of a miner with whom I am personally familiar. Six months ago, there was a fall of roof in the chamber of the mine in which he worked. He was badly crushed under a great mass of rock and coal; but when he was extricated, it seemed as though he would recover soon. But he was injured internally, and, after a most tedious and costly experience, he is now able to walk about, the mere shadow of his former self. His nervous system is shattered. He will not remain in a room alone because of the sensation of the great fear that the roof will fall upon him, and he rarely walks any distance from his door unless somebody accompanies him. This man has a wife and several little ones, and the prospects of his ever being able to work for them again are not bright. There are many cases of this kind among those injured, and some are even worse. Of the 288 reported injured by Mr. Blewitt of this district, 88 are seriously hurt and permanently disabled.

Of course, it is impossible to avert some of the disasters which result in death in the mines; but it is possible, by observing proper caution and complying rigidly with the provisions of the Mine Ventilation law, to lessen the misery which sends a surge of sorrow annually along the coal valleys of Pennsylvania. Falls of roof might be greatly lessened by using sufficient timber in propping, explosions of gas could be averted by a careful use of the safety-lamp, and the deaths occurring from explosions of powder are almost inexcusable. A more uniform system of working the mines on the part of the companies would also reduce the death record of the region. It is either a headlong rush to supply the demand or a suspension to create one. When the mines are worked, every thing is strained to the very highest tension, and the wonder is, that there are not more accidents. Working more regularly, taking time to keep the mines

Digitized by Google

in proper condition as their development progresses, and paying some heed to the lives of the industrious and courageous population that gives life and energy to the most important industry in the State, would accomplish the same results in the market, and leave fewer broken hearts in the track of the anthracite trade.

There is every evidence that the present Legislature of Pennsylvania intends to do something in the way of reforming, by the enactment of needed laws, many evils that now exist in the anthracite regions of the State. In the House, Mr. Hines, of Luzerne County, representing a mining constituency, has already signaled his intentions; while in the Senate, Mr. King, of Schuylkill, will soon introduce a bill creating a commission to make inquiry into the ventilation law, and report by bill or otherwise what amendments are necessary to carry out its purpose—the protection of the lives and limbs of those who work in the dark chambers of the collieries. It is proposed to make up this commission of the six mine inspectors, six practical coal miners, and six operators to be selected by the governor.

The present ventilation law was the outcome of the terrible calamity at Avondale in 1869, where scores of miners lost their lives. Up to that time, none of the collieries was provided with any means of escape from a fire at the top. The men went down the main shaft and came out of the mine the same way. There were no safety openings. At Avondale, the giant breaker which stood directly over the deep shaft took fire, and, as a natural sequence, drew every breath of air out of the chambers below, where more than one hundred men were at work. They were all suffocated. That calamity occurred nearly fourteen years ago. The frightful lesson had its effect upon the succeeding legislature, and what is known as the ventilation law was passed. That compelled the coal companies to construct openings through which the miners might escape if shut off from passing up the main shaft by any disaster. Since these openings were made, however, there is not a colliery anywhere that has not extended its workings far beyond what were the boundaries a dozen years ago, in some instances running over a mile ahead of them. If it is supposed that the companies have made new openings from time to time as they were needed, the idea is a great mistake. They have done no such thing. The ancient opening stands, although in the great majority of instances of no practical value whatever, and there can be no prosecution of any violation of the law.

There are dozens of big mines in this locality where the breakers are built just as the Avondale breaker was, directly over the main shaft. If any one of them should happen to take fire while the men are down below, the results would be horrible enough. The old safety opening, instead of being a help in time of danger, would only add to the difficulties by creating a draught through which the smoke would be drawn into the chambers in suffocating volumes. But, aside from this, the mines with the passage of time become more gaseous. To illustrate: Twelve years ago, when the present ventilation law was passed, there were only 8000 persons employed in the collieries of this, the middle district of the Wyoming region, and only two or three mines at that time generated explosive gases. Now there are 16,000 men employed in the same district, and over three fourths of the collieries are generating explosive gases in large quantities. Years ago, the miners could work with the provision of 10,000 or 12,000 cubic feet of fresh air per minute. Now, in most of the collieries, it requires over 250,000 cubic feet per minute to dilute the gases and make working safe. The reason why more air is needed now than formerly is because the workings have gone down to the solid and deeper bases, Unquestionably, there is need of fresh legislation in the important matter of mine ventilation.

Mr. Williams, the Inspector for this middle district of the Wyoming region, has figured out the losses, and they are appalling enough. No less than 73 men were killed in the mines of the district last year, and 185 injured, half of the latter seriously, incapacitating most of them for doing any work in the future. There were 35 widows and 91 orphans made by these accidents in the middle district last year. It is unquestionably true that a large number of mishaps might be avoided if the companies cared to correct certain evils that exist. But they do not do that, and, therefore, to the carelessness of the men must be added the culpability of the corporation when we come to estimate the causes that produced the sorry results of the year.

For some time past, the Hungarians, who have been flocking in dirty battalions to the coal-fields for over a year, have been the greatest sufferers by mine disasters. As a general thing, they have been employed as laborers in the collieries, their duty being simply to fill the cars after the miner has finished knocking down his coal for the day. Each miner employs a laborer, whose work he pays for himself. Labor has been so scarce in the coal-fields for a year past that the Hungarian has found no difficulty in obtaining work as soon as he got among the mines. But his ignorance and lack of knowledge of the English language have been sources of great annoyance to the mine bosses, who are charged with instructing mine workers in the dangers that threaten at all times. By signs alone are the Hungarians made partly to understand the dangers of their employment, and even these are frequently of no avail. They daily persist in going into all sorts of danger, and fully three fourths of the gas explosions occurring last year in the mines of this district are traceable to the ignorance of the Hungarian laborers.

THE CARVÉ COKING SYSTEM.

Dr. Angus Smith, her majesty's inspector under the alkali acts, says in one of his yearly reports that "the present method of making coke in England has all the appearance of roughness and savagery which extravagance always produces." A final change in this direction seems now generally to be creeping in after the several abortive attempts of former years. The paper read in London by Mr. H. Simon, of Manchester, in 1880, before the Iron and Steel Institute, was mainly instrumental in bringing the question again before those most interested in it. According to English journals, Messrs. Pease and Partners, of Darlington, were the pioneers in taking up the system recommended, and patented by Mr. Simon in England. The success of the process had previously been fully demonstrated in France. The Messrs. Pease proceeded to build a battery of twenty-five ovens, which have now been at work for a considerable time. The firm appears to have done full justice to the invention, and has spared neither trouble nor expense to make it a success. All the figures and statements given by Mr. Simon in his paper as to the results obtained in France seem to have been completely confirmed, and in some respects surpassed. Above all, it has now been practically proved that the coke obtained in these ovens is excellent, and leaves nothing to be desired as furnace coke. It is of great hardness, and is said to contain less sulphur. The latter circumstance is easily understood, if it is considered that the gas evolved during the process is in this system continually sucked or pumped away, including, of course, a good percentage of sulphur in gaseous form. The quantity of coke is increased to fully 75 per cent (after deducting moisture) of the coal charged. This, in itself, and comparing it with the ordinarily obtained percentage of from 62 to 65 per cent of coke, is a gain of 10 per cent in coke, or equal to, say, 1s. per ton of coke made. The by-products, in the shape of tar and ammonia-water, amount in value to between 5s. and 6s. per ton of coke made, assuming tar to be worth 3d. per gallon, and ammonia-water 1d. per gallon.

Each of the coking-chambers built at Crook, at the Pease's West Collieries, produces about one ton in the twenty-four hours. The total possible extra profit realized over and above the previous ordinary profit in coke-making would, therefore, appear to be about 1s. for extra quantity of coke, and from 5s. to 6s. for by-products, or from 6s. to 7s. per ton of coke. Against this should be set a possible slightly increased expense in the working of the ovens. It seems that the expenditure under this head amounts to about 1s. 6d. per ton, as against nine to twelve pence under the old system. It is stated on the authority of one of the best known chemical manufacturers in the North of England, who has analyzed and used the tar made according to the Simon-Carvé system at Messrs. Pease's works, that its quality is even superior to the best average tar obtained from gas-works. It is possible that the value of the by-products would by an over-production be reduced to some extent; but it is said that, as far as tar is concerned, the value of this product has been increasing considerably of late, on account of its increasing importance for the manufacture of aniline dyes. With regard to the ammonia-water, it is believed that, if the price were to fall a little, an almost unlimited inquiry for its use as artificial manure in agriculture would be sure to spring up, the only reason why it is less used at present being that the cost is still somewhat too high.

Within certain limits, it may be considered to be a drawback to this system that the establishment of the coke-ovens and apparatus seems to be rather expensive. In view, however, of the extraordinary returns which would make it appear that the whole cost of the establishment would be refunded by the returns of less than two years' working, this question can not be considered of very great importance, at least not for any of the many wealthy firms in that particular trade.

CANADIAN APATITE.

Written for the Engineering and Mining Journal.

The numerous openings made by prospectors and miners in the phosphate regions of the provinces of Ontario and Quebec have afforded excellent opportunities for the study of the Laurentian minerals and their mode of occurrence. The crystalline limestones of the Laurentian series are remarkable for their great extent and for the variety of crystalline minerals which they contain. They are interstratified with beds of dolomite, which sometimes contain a portion of carbonate of iron, and inclose serpentine, tremolite, quartzite, and a little white mica, but are generally less abounding in foreign minerals than the pure limestones. Several mineral species might be mentioned as marking bands in the stratification. Among these, there are apatite, chondrodite, pyroxene, magnesian mica, and graphite. Apatite or phosphate of lime is one of the principal features of the limestones of the Laurentian series. It is found in a variety of colors and shapes, sometimes in rare crystals disseminated throughout the veins; at others, in solid masses, in veins of great width. Sometimes, it is in the form of prisms. These are generally rough, but often terminated, and always have their angles rounded. Apatite is generally associated with pyroxene, which has also been found in large crystals. It is sometimes found with phlogopite. In a crystal of the latter, about four inches in diameter, a crystal of apatite about a quarter of an inch thick and two inches long was found imbedded, the axis of the prism being parallel with the cleavage of the mica. Rounded masses of calcite are often inclosed in the apatite, which in its turn is frequently in rounded pale-green crystalline masses imbedded in the coarse-grained limestone.

Apatite is used in the arts for the manufacture of phosphoric acid and phosphorus, and enters largely into the composition of certain porcelains. It is, besides, very extensively used as fertilizer of the soil. Phosphates are among the minerals most essential to vegetation, and are removed from the earth in large quantities by growing crops. The importance of a supply of phosphates to the soil is made very evident by the fact that the mineral constituent of the bones of animals is for the greater part phosphate of lime. This material, whether in the form of bones, coprolites, or apatite, is seldom applied to the soil in its insoluble state, as it is then comparatively unavailable for the nutrition of plants. To render it fit for agricultural purposes, it is converted into a soluble salt, which is known as a superphosphate of lime. The process of conversion is as follows: In the insoluble mineral or bone phosphate, one equivalent, or 71 parts, of phosphoric acid, is united to 3 equivalents of 28 parts each of lime, making the equivalent weight of the ordinary phosphate of lime 155. In order to reduce this to the soluble superphosphate, which contains one equivalent of phosphoric acid and one of lime, it is necessary to remove two thirds of the lime, or two equivalents. This is effected by adding two equivalents, or 98 parts of sulphuric acid, which form with this lime 136 parts of sulphate. One hundred parts of ordinary phosphate of lime, therefore, require 63·2 parts of sulphuric acid to convert them into the soluble superphosphate with one equivalent of base. In this process, however, regard must be had to the foreign matters which accompany the phosphate, and which may also require sulphuric acid for their decomposition. Of these, the principal are fluoride of calcium and carbonate of lime. The former is always present in small quantities in bones and in still larger amounts in many of the mineral phosphates, and requires for decomposition of 100 parts, 125 of sulphuric acid

Digitized by Google

while carbonate of lime, as an impurity, requires 98 parts of acid to decompose 100 parts.

Of late years, the increasing demand for phosphates as fertilizers has drawn attention to the use of the crystalline mineral phosphate of lime, or apatite, of which large quantities have been imported from Norway into England, and attention has recently been turned to the abundant supplies of this substance found in Canada, and large importations have recently been made from the Canadian phosphate regions into England. The present price for apatite in England is one shilling and five pence per unit, or about $30 per ton, for a first-class grade. Capital is slowly investing in the phosphate lands of Canada. Railroad enterprise is moving for the purpose of transportation, and the time is drawing near when the mining or quarrying of phosphates will be one of the largest and best-paying industries in Canada. The cost of production being small, but very little capital is necessary, and the large and continued demand fixes the price for which the mineral can be sold at such a figure that, as a profitable undertaking, not a doubt remains.

THE MANGANESE DEPOSITS OF SOUTHERN RUSSIA.

A few years ago, two Russian engineers, Batsevitch and Simonovitch, in preparing a geological map of the Caucasus, in Southern Russia, were struck with the occurrence of a large and continuous deposit of pyrolusite cropping out on the banks of the Kvirila, a tributary of the Reon River, which empties into the Black Sea at Poti, near Batoum. These deposits are extremely interesting geologically; but however great an excitement they created at one time, they appear to be of comparatively little consequence so far as the markets of manganese are concerned. It is estimated by a writer in the *Génie Civil* that the consumption of manganese ore in the world is not more than 100,000 tons, of which only a quarter is used in the chemical industries, the rest being used in blast-furnaces for the manufacture of ferro-manganese and spiegeleisen. The principal reasons why the Russian deposits, though extensive, are not likely to affect the markets much are, that they can not compete with the newly-found deposits in Central Spain, the freights to the sea-board being excessive, and the irregularity of their contents of phosphorus, which ranges from two thousandths of one per cent in the solid varieties to one per cent in the earthy ores. With care in picking, the latter trouble may be overcome.

The pyrolusite is found as a horizontal bed in Miocene fine-grained sandstones resting upon Cretaceous limestones. Parts of the bed have been removed by erosion, so that it crops out on both banks of the Kvirila River and its tributaries, the deposit being traced near Perevisse, Choukroutis, and Itkvissa on the left, and near Tchiatoura, Rgani, and Tsirkvali on the right bank. The Kvirila Valley has been opened by a railroad connecting Tiflis with Poti on the Black Sea, which is, however, a poor port. The bed of manganese ore, the first pyrolusite thus found, has a total thickness ranging from 6 to 9 feet, and consists of alternate layers of compact and oolithic pyrolusite of shales and sandstone, the thickness of the individual layers varying. The aggregate thickness of compact shipping ore, low in phosphorus, is from 24 to 28 inches.

SOME SWEDISH EXPERIMENTS WITH THE BESSEMER PROCESS.

Mr. C. G. Dahlems has reported to the Swedish Iron Board the results of a series of analyses of samples of metal and cinder taken at different stages of the Bessemer process, at the Langshyttan, Nykroppa, Bangbro, and Westanfors steel-works. Ferro-manganese was added at the close at the first three works, the quantity of pig charged and ferro-manganese added being as follows: Langshyttan, 60 cwts. of pig and 0·4 of ferro-manganese; Nykroppa, 71 and 0·3 cwts.; Bangbro, 53 and 0·5 cwts. respectively; and Westanfors, 63 cwts. of pig and no ferro-manganese. The following are the analyses, tabulated:

	Langshyttan.	Nykroppa.	Bangbro.	Westanfors.
Pig-iron:				
Carbon	3·94	4·35	4·00	4·22
Silicon	1·14	0·88	1·02	1·06
Manganese	0·64	1·15	1 83	5·12
Metal:				
First sample. Time	2 m. 15 s.	2 m. 30 s.	3 m.	4 m. 15 s.
Carbon	4·02	4·01	4·03	4·02
Silicon	0·04	1.10	0·03	0·43
Manganese	0·12	0·15	0·22	3·26
Second sample. Time.	4 m. 30 s.	5 m. 30 s.	4 m. 45 s.	8 m. 35 s.
Carbon	1·10	1·00	0·90	1·30
Silicon	0·03	0·05	0·03	0·12
Manganese	0·12	0·15	0·12	0·85
Third sample. Time.	5 m. 30 s.	6 m. 30 s.	5 m. 45 s.	9 m. 20 s.
Carbon	0·05	0·08	0·10	0·55
Silicon	0·01	0·04	0·03	0·07
Manganese	0·06	0·08	0·09	0·43
Cinder:				
First sample. Same time.				
Oxide of iron	34·72	13·50	14·20	4·20
Oxide of manganese	13·95	29·76	26·31	46·38
Magnesia	0·24	0·23	0·22	0·54
Lime	2·60	0·42	0·62	1·26
Alumina	0·78	2·28	2·86	3·08
Silica	48·76	53·26	55·26	45·87
Second sample.				
Oxide of iron	21·08	9·34	18·52	6·24
Oxide of manganese	13·48	23·70	31·01	52·26
Magnesia	0·30	0·28	0·14	0·29
Lime	3·25	0·60	0·38	0·70
Alumina	0·98	3·90	2·70	2·49
Silica	59·82	62·34	47·20	39·07
Third sample.				
Oxide of iron	35·82	30·60	31·19	9·45
Oxide of manganese	12·29	21·39	25·43	48·92
Magnesia	0·21	0·21	0·11	0·46
Lime	2·35	0·38	0·32	1·00
Alumina	0·72	2·14	2·24	2·94
Silica	48·48	44·54	40·50	37·63

On examining this table, it will be found that the result of the Bessemer process is chiefly dependent on the quantity of manganese in the pig; if the contents of manganese are small, as, for instance, at Langshyttan, the oxidation of nearly all the silicon and manganese takes place at the beginning of the blowing, before any carbon is as yet eliminated, while the silica and oxide of manganese, as well as a small quantity of oxide of iron formed, constitute the slag. The elimination of the carbon begins first at this point, which, however, as the process proceeds, becomes so rapid that the tuyeres can not supply the oxygen which the carbon requires, and some is also taken from the oxide of iron in the cinder; but as iron is also eliminated from the cinder, the latter decreases in quantity, by which the percentage of the other constituents increases. This is just the case with the cinder taken after decarbonization at Langshyttan and Nykroppa, where pig-iron containing less manganese was employed. It is, however, possible that the percentage of silica and alumina have been somewhat increased in these cinders by fire-clay loosened from the walls of the furnace. This seems, at all events, to have been the case at Nykroppa, where not only the percentage of oxide of iron, but also of oxide of manganese has been reduced, while the other constituents have been increased.

THE PRODUCTION OF RAILS IN 1882.

Reports have now been received by the American Iron and Steel Association from the owners of all the mills in the United States that rolled iron and steel railroad bars in 1882. These reports show that the total production of iron and steel rails in this country last year was 1,688.794 net tons, or 1,507,851 gross tons. As the production in 1881 was 1,844,100 net tons, or 1,646,518 gross tons, there was a falling off in 1882, as compared with 1881, of 155,306 net tons, or 138,667 gross tons, which is equivalent to a decrease of 8 per cent. There was a decrease in every State but six—Vermont, Massachusetts, Missouri, Colorado, Wyoming, and California.

No rails were made in 1882 in New Jersey, Virginia, and Georgia, in all of which States rails had been made in 1881. The number of rail-making States, therefore, fell to 18 in 1882, against 21 in 1881. The following table shows the production of the various kinds of rails in 1882, as compared with 1881, in net tons:

Kinds of steel.	1881.	1882.
Bessemer steel	1,330,302	1,438,155
Iron	488.581	227,874
Open-hearth steel	25,217	22,765
Total	1,844,100	1,688,794

This table shows that the quantity of Bessemer steel rails made in 1882 exceeded the quantity made in 1881, while the production of iron rails fell off heavily and that of the open-hearth steel rails fell off slightly.

The five leading rail-making States are Pennsylvania, Illinois, Ohio, New York, and Missouri. Their production of iron and steel rails in 1882, as compared with 1881, was as follows, in net tons:

States.	1881.	1882.
Pennsylvania	891,179	850,908
Illinois	433,420	362,250
Ohio	153,596	113,806
New York	109,283	105,021
Missouri	64,226	85,528
Total	1,651,704	1,517,513

PROGRESS IN SCIENCE AND THE ARTS.

The Manufacture of Magnesia.—The manufacture of magnesia for a variety of purposes is beginning to assume proportions abroad that render it a subject of interest. Sorel, as early as 1867, called attention to the fact that pure caustic magnesia, mixed with a solution of chloride of magnesium, becomes a solid mass, which has the hydraulic qualities of cement. He established works in Paris, which still make a very white cement, capable of being colored and used for a variety of purposes. Sorel uses magnesite from the island of Eubœa as a raw material, because it is exceptionally pure and free from quartz. A year later, Caron published experiments proving how refractory magnesia is. He found that magnesite calcined at the highest temperature was not sufficiently plastic alone, and he therefore mixed it with from 5 to 10 per cent of slightly calcined magnesia, and this mixture is recommended in manufacturing refractory materials from magnesia obtained by any process, because the bricks and crucibles made shrunk but little. His results did not attract much attention until the importance of the basic dephosphorizing process was admitted, and then German chemists suggested the final liquors obtained in the manufacture of potash salts at Stassfurt and Leopoldshall as a raw material. The bulk of these liquors was wasted, although they contain from 27 to 30 per cent of chloride of magnesium. It is estimated that when 70,000 cwts. of carnallite are daily treated, the final liquors hold from 16,000 to 18,000 cwts. of anhydrous chloride of magnesium, from which 5000 cwts. of magnesia could be manufactured daily. Herr Ramdohr some time since, at a meeting of the Society of Engineers, described the method of manufacture adopted. The plan of precipitating the magnesia with burnt lime has never been practically adopted, because the magnesia precipitated is very voluminous, and can not readily be rid of the chloride of calcium adhering to it; nor has the Closson system of substituting dolomite for lime been introduced. The system actually in use by Messrs. Ramdohr, Blumenthal & Co. for about a year, after almost two years of experimental work, is to decompose the chloride of magnesium by heating it. It has been known for a long time that chloride of magnesium is partially decomposed by being subjected to an elevated temperature, magnesia and hydrochloric acid being formed. But from 9 to 10 per cent of chlorine remain in the solid residue when heating is simply resorted to. By using an oxidizing flame and highly superheated steam, no trouble has been found in obtaining nearly chemically pure magnesia and hydrochloric acid of 21 degrees Beaumé, and besides gathering the bromine in the solution. The magnesia thus made is fine white powder, which absorbs carbonic acid and moisture from the air if dried at from 180° to 200° Celsius; but it loses this property to a great extent when calcined at a white heat. Magnesia dried at a low temperature is pronounced a superior material for cement, five parts of it being mixed with four parts by weight of a solution of chloride of magnesium of from 25 to 30 Beaumé. It is stated that this cement will bear a very large admixture of sand—as high as twenty times its weight. Magnesia is

Digitized by Google

now also used as a basic lining. Messrs. Ramdohr, Blumenthal & Co. ship their magnesia to Messrs. Vygen & Co., of Duisburg, who make magnesia bricks which are said to be very hard, sharp, and refractory, and have a density of from 2·9 to 3. No sintering material is necessary for these bricks when burnt at a white heat.

THE GERMAN PIG-IRON PRODUCTION IN 1882.—The following return, showing (in units of 1000 kilos.) the production of the German blast-furnaces for 1882, has been compiled by the German Association of Iron and Steel Manufacturers, and published in the *Stahl und Eisen:*

	Forge pig.	Spiegel.	Bessemer pig.	Foundry pig.	Estimated work.	Total of pig-iron.
January.....	159,451	12,080	68,327	26,859	18,500	285,217
February.....	148,155	11,599	58,109	19,237	4,500	241,600
March.....	164,624	10,707	57,024	18,582	5,500	256,437
April.....	146,409	12,108	57,634	19,939	5,800	241,890
May.....	152,383	12,805	57,737	17,676	2,700	243,301
June.....	150,084	15,725	56,078	20,148	4,700	246,735
July.....	178,723	9,649	57,382	19,279	2,100	267,133
August.....	175,480	12,412	61,791	19,663	2,100	271,446
September	172,145	12,448	62,145	22,891	3,100	272,729
October.....	187,427	10,180	62,152	21,691	2,500	283,950
November.....	175,809	8,420	64,694	23,238	4,600	276,761
December.....	170,286	11,381	70,592	29,399	2,100	283,758
Total	1,980,976	139,514	733,665	258,602	58,200	3,170,957

PILE-DRIVING BY DYNAMITE.—In the course of executing some municipal works at Buda-Pesth, the piles already driven were required to stand a greater load than had been originally contemplated. It was, therefore, necessary to test them, and drive still deeper those that yielded. On account of the expense of bringing a pile-driving machine successively over each pile for so little work, it was determined to try the effect of dynamite; and the city engineers applied to Colonel Prodanovic, of the Second Regiment of Austrian engineers, to carry out the experiments. According to the *Wochenschrift des Oesterreichischen Ingenieur and Architekten Vereins*, the piles were cut square, and a wrought-iron plate 15 inches in diameter and 4⅜ inches thick was placed on the top of each. On its center, and immediately over that of the pile, was placed a charge of No. 2 dynamite, in the form of a cake, 6 inches in diameter and ¾ inch thick, and weighing 17½ ounces avoirdupois. This was wrapped in parchment-paper, covered with clay, and fired. The effect produced was found on an average to be equal to five blows from a 14¾ cwt. monkey falling from a hight of 9 feet 10 inches. The iron plates stood from twenty to twenty-four explosions. The system is not considered applicable to a pile standing considerably out of the ground, but saves a great expense when piles already driven have to be sunk deeper. In this country, gunpowder has been used for many years, particularly in Philadelphia, for pile-driving, though employed generally to drive the monkey upward.

AN AUSTRIAN WIRE ROPE TRAMWAY.—A description has recently been given in the German technical press of a wire tramway in connection with the coal-mining industry established near the Hersteigg, the products of which it brings to the main line belonging to the Southern Railroad of Austria. In its alternating rise and fall during its distance of 3000 yards, there is a useful excess of incline of about 142 yards, which, it is said, suffices to keep the line in self-acting working, after it has been started by means of the twelve horse-power engine provided for that purpose. When there is no return load to be sent to the mine, the speed of the line can be regulated by a brake. Under these circumstances, the cost of working the line is estimated at about 4½ cents per ton of coal. In its general arrangement, the tramway forms a straight line, and consists of two drawing ropes and the train rope. The line which is used for conveying the coal to the station is 1·10 inches thick, and is composed of 19 steel wires, each ·18 of an inch in diameter. The line on which the coal buckets are returned to the mine is only ·66 of an inch thick, the 19 steel wires of which it is composed being only ·13 of an inch thick. Both ropes consist of wires about 765 yards long, coupled to each other, and for the ropes a breaking strength of 73 tons per square inch section is guaranteed. At the ends of the ropes, weights of 5 and 3 tons are applied in the usual way for obtaining the proper tension. The distance between the seventeen supports varies from 60 to 400 yards. The train rope is ·6 of an inch thick, and consists of twelve soft steel wires of ·07 of an inch diameter, and runs at a speed of about 1⅞ yards per second. The buckets which convey the coal follow each other at a distance of about 83 yards; thus thirty-six are always on the way to and the same number coming from the station. Each bucket contains about 10 bushels, or about a quarter of a ton of lignite, the total quantity carried per hour being about 17½ tons. The cost of the line was about $14,000.

FURNACE, MILL, AND FACTORY.

The Vulcan iron-works, in Carondelet, opened February 19th, after having been closed for some months. The managers have been quietly securing non-union men, and this morning had engaged a sufficient number to begin work again.

The blast-furnace and rolling-mill of the New York & Ohio Iron and Steel Company, at Ironton, Ohio, are advertised for sale at public auction, March 1st, 1883, unless previously sold. A minimum price of $62,500 has been set on each mill.

The Ashland furnace has been compelled to cease operations for the present, on account of high water.

The Falcon furnace, Youngstown, Ohio, has been blown in, the repairs having been completed.

The Ohio Powder Company is making 250 kegs of powder per day and running the machinery day and night to keep up with its orders.

The Forsyth scale-works have received an order for a forty-ton extension track scale for the Jacobs & Hazleton Coal Company, and a similar order from the Clark & Price Coal Company.

The rolling-mill of the Reading Iron-Works has started up again on both night and day turns, thus giving employment to about 300 men. The sheet-mill of the Reading Iron-Works has indefinitely suspended work, throwing 300 men out of employment. Dullness in trade is assigned as the cause. The wages of puddlers and heaters in the neighboring mill have been reduced a dollar a ton.

A company with a capital of $35,000 has been established at Lynn, Mass., to manufacture sheet-copper, iron, and tin ware.

The Junction Iron Company, situated at Mingo Junction, Jefferson County, Ohio, has recently enlarged its plant, which at present consists of two blast-furnaces and one nail-mill. Furnace No. 1 has been in blast, averaging 80 tons of iron per day, but was blown out last week. The nail-mill has resumed work.

It is reported that Furbush's iron foundry, Camden, N. J., will soon resume operations.

Starr's iron-works, Camden, N. J., which shut down previous to their sale, will resume work, the sale having been postponed. The works have a capacity of 1000 hands.

The Laclede rolling-mills, of St. Louis, have shut down on account of dullness of trade, throwing 600 men out of employment.

Fayette Brown, of Cleveland, Ohio, has been appointed receiver of Brown, Bonnell & Co., on the application of the Jackson and Lake Superior Iron and Mining companies and the Negaunee Concentration Company. They have claims amounting to $30,000. Mr. Brown said he expected that the Youngstown works would be shut down and an inventory taken, after which it would be managed so as to make the most out of the property. The company represents that it has a large quantity of stock on hand and good contracts, and that its assets are largely in excess of its liabilities.

J. V. Ayres's Sons, dealers in iron and steel, Chicago, have suspended. The liabilities of the firm are reported to amount to more than $1,500,000. This firm held a large interest in the iron-works of Brown, Bonnell & Co., at Youngstown, Ohio.

The Excelsior iron-works, of Chicago, Ill., under the direction of the Pacific Iron-Works, of San Francisco, are building a 30-ton copper-smelting plant for the H. O. W. Copper Mining Company, of Deadwood, Dakota.

New foundations for the recently destroyed plant of the Chicago Smelting and Refining Company are laying. The buildings will be 120×220, with blast-furnace 60×60. Some new machinery will be added, and it is expected that the works will be ready to receive and refine bullion May 1st.

The Quinnimont furnace and property were recently sold for $150,000.

A Northern company has purchased the iron bed near Rome, Georgia, and another blast-furnace is to be erected.

The reported failure of the Chicago & Carp River Iron Company of Marquette, Mich., and the statement that it had given every thing up to creditors in general assignment, are authoritatively denied. Mr. Charles H. Himrod, agent for the company, states that the company had difficulty, but will come out all right. The situation had been complicated by the failure of the Union Fuel Company, of Marquette, in which it was interested, and this had given rise to the report.

It is reported that the Fox River Iron Company of Greenbay, Wis., has assigned. Capital, $200,000; assets, $90,000; liabilities, over $65,000.

A dispatch says that the furnace of the Wampum Iron Company, at Wampum, Penn., was closed February 21st by the sheriff on a confessed judgment of $20,000. The failure was brought about by the recent financial difficulties of Kloman Brothers, Pittsburg.

The Pittston stove-works started work February 21st with new men. This gives employment to a large number of men and boys. The molders here have been on a strike since January 1st.

The Colebrook furnaces, at Lebanon, Pa., during the week ended on the 10th instant, largely exceeded their former best record. The daily product of these furnaces for the week was as follows, in tons of 2250 pounds:

February.....	4	5	6	7	8	9	10	Total.
No. 1 furnace.....	85	85	84	91	94	94	93	626 tons.
No. 2 furnace.....	82	72	86	83	86	75	97	581 "
Total								1,207 tons.

The fuel used per ton of pig-iron made at No. 1 furnace was 924 pounds of anthracite coal and 1582 pounds of coke; total, 2506 pounds. The fuel used at No. 2 furnace was 802 pounds of anthracite coal and 1605 pounds of coke; total, 2407 pounds.

GENERAL MINING NEWS.

ARIZONA.

The Peabody mine, at Russellville, has been sold to the owners of the Clifton mines, a Scotch company, for about $300,000.

COCHISE COUNTY—TOMBSTONE DISTRICT.

Late dispatches state that the Ingersoll hoisting-works started up three days ago, and the Stonewall hoisting-works started up yesterday. Both work admirably. The suit of the Town-Site Company against the Vizina, for surface ground, is now in progress at the District Court. The blackmailing suit against the Grand Central Company is reported to have been compromised for $3000. The Contention 300 level is looking better than ever before. There is enough ore in sight to supply the mill for ten months. Assays average $90 per ton. Strata of ore have been struck in the Big Pedro mine which assay $1800 per ton. A suit for one half of the Last Chance mine is in progress in the District Court.

GRAHAM COUNTY—CLIFTON DISTRICT.

COPPER QUEEN.—Reports state that a suit has been brought by O. Bear against this company to recover one ninth of the mine and its product. The suit involves several million dollars.

CALIFORNIA.

AMADOR COUNTY.

BUNKER HILL.—This company, after running through the supposed foot-wall of its mine, struck a ledge of good ore 5 feet wide.

MONO COUNTY—BODIE DISTRICT.

BODIE CONSOLIDATED.—During the week ended February 15th, 126 tons of ore were crushed; average assay value, $36 per ton. The east cross-cut, 1000 level, is in 269 feet. The rich vein in the north drift, 780 level, has split up, and the drift has been stopped at a distance of 48 feet from the cross-cut.

STANDARD CONSOLIDATED.—During the past week, 1406 tons of ore were crushed. The east cross-cut from south drift, 1000 level, is in 285 feet. South drift from east cross-cut, 700 level, is 416 feet long, and the vein in the face is 2½ feet wide. The vein in the stopes from the upper levels is from 7 to 12 feet wide. At the annual meeting of stockholders, the following officers and directors were elected for the coming year: President, Thomas Bell; Vice-President, W. S. Wood; Treasurer, the Nevada Bank; Secretary, William Willis; Superintendent, William Irwin; Directors, Thomas Bell, Thomas Brown, William Willis, R. H. Laimbeer, M. R. Cook, and John H. Boyd.

PLUMAS COUNTY—GREENVILLE DISTRICT.

The Greenville *Bulletin* reports as follows:

CRESCENT.—The work of prospecting is going on with much vigor, and a very large amount of ore is brought in sight in the different ledges. When spring opens, there will be enough in sight to supply the full milling capacity for a long time.

TAYLOR-PLUMAS.—About fifty tons of ore were crushed in the new mill, and from this a partial clean-up was made of bullion to the amount of seven hundred dollars; the ore crushed was a miscellaneous mixture, taken from all parts of the mine. In the mine, the winze is now down about fifty feet; the many stringers have all run into the main ledge, which is now about five feet wide, and looks very well; at this depth, a drift will be started east to develop the ledge, and should its present appearance be maintained there, a shaft will be sunk close to the mill through which the ore will be hoisted and run directly to the battery.

CANADA.

NEW BRUNSWICK.

QUEEN MANGANESE MINE.—A shipment of 212 tons of ore, valued at $3392,

Digitized by Google

was recently made from these mines, at Markhamville. It is reported that the mines produce almost all grades of ore, from that worth $16 a ton to ore worth $100.

COLORADO.

CHAFFEE COUNTY.

CALUMET.—The incline sunk on the original discovery is now down about 319 feet, pitching at an angle of about thirty degrees. From this incline, levels have been run at 100 and 200 feet both ways. At the 100-foot level, the vein shows a body of very fine iron ore, over thirty feet wide. The ore is magnetic iron, similar to that found in the Lake Superior region. The company began operations two years ago, and for about half of that time have been engaged exclusively in development-work. A force of about fifty men is at present engaged working two shifts, only a small proportion of which are stoping, yet the daily output of the mine is 100 tons. At the 100-foot level, the northeast stope is a huge chamber, the walls and bottoms of which are almost solid ore. The heading is advanced about 100 feet from the incline, and ore has been stoped the whole width of the vein, over thirty feet, and taken out overhead to a hight of over twenty feet. The 100-foot level shows the finest body of ore, and is at present the main source of supply for shipping. All the timbers required for the mine are let down the incline to the two levels, and the ore is dropped from the 100-foot level to the 200-foot or tunnel level by means of a chute, thus avoiding all expensive hoisting machinery. The 200-foot level connects with the surface by a cross-cut tunnel. At a point about 200 feet from the mouth, the vein is cut and lateral drifts have been started in the shape of a Y, for the purpose of developing the main ore-body. The ore appears to be somewhat scattered in the 200-foot level, though the impression is, that it will be found solid in the north drift.

CLEAR CREEK COUNTY.

MINT.—The contract has been let to drive a 200-foot adit on the company's property, on McClellan Mountain. The property consists of a net-work of half a dozen lodes, all of which can be worked through the adit now driving. A great deal of rich float-ore has been found on this mountain, and it is the general belief that the company has property in which will be tapped the original source of some of this float.

GILPIN COUNTY.

A correspondent of the Central City *Register-Call*, in speaking of the mines on Quartz Hill, says: On the westerly boundary-line of developed veins, the Forks was worked, the depth of the main shaft being over 900 feet. The ore raised does not differ materially in its appearance from that taken out of the Hidden Treasure, which in its lower workings—1300 feet—has been developed into pay. The Kansas-Monmouth formerly—now operated by the Denver Company, Limited—employs forty stamps on Kansas and Kent County ore, with profitable results. Working out in a southeasterly direction, the Phœnix-Burroughs and Mackey-Burroughs were reached. Work continues at the workings of these properties, both on the same vein. At the Roderick Dhu, sinking the main shaft is continued below a depth of 600 feet. At the Illinois, sinking is going on without any material change. South of the Illinois, the main shaft of the Ingalls is in proper shape for deeper workings. A new shaft has been erected which incloses a stationary engine and boiler of about 25 horse-power capacity. At the Egyptian, development-work is progressing. The output of the California mine furnishes the mill ore for fifty stamps, enough now remaining on the stulls to keep fifty more stamps running. On the summit of Quartz Hill, the Pyrenees shows gold-bearing ore—milling and smelting—although the latter quality is of a galenous character. The Aurora Company, on the southerly slope of Quartz Hill, outside of timbering the main shaft over the Charter Oak lode, and the erection of a shaft building, has accomplished but little, it being late in the season when it began operations. Sinking is continued.

BARKER.—Work has been commenced on this lode, situated west of the Kent County mine. A shaft 80 feet in depth has been cleaned out and timbered up wherever needed, and sinking resumed. The east and west levels are driving through a good body of ore. The crevice-matter in the bottom of the shaft is of uniform width, and as depth is attained it improves.

GUNNELL.—The production for the month of January was as follows: Smelting ore sold, $10,029.70; mill gold, $2229.15; tailings, $147.55; total product, $12,406.40.

HINSDALE COUNTY.

CROOKE MILLING AND SMELTING COMPANY.—The west drift of the 7th level of the Ulé is under cover 15 feet and the east drift 18 feet. Ore-body heavy and rich. The winze in east of drift on 6th level is down 56 feet in same body of ore as found in shaft. The concentrator is running on the dumps and doing splendid work.

MICHIGAN.—Shaft 7½ feet at the end of a 55-foot drift. On the hanging-wall there are 20 inches of gray copper, much of which is crystallized pyrites of iron and copper. There is a foot of vein-matter following this mineral, and then 12 inches of gray copper streak. The vein is larger and better defined than heretofore.

LAKE COUNTY.

Late Leadville exchanges contain the following:

DUNCAN.—Shipments will soon be begun. Drifts are driven to open up undeveloped territory and otherwise thoroughly explore the remaining portion of the ground.

IRON SILVER.—The Mayor shaft has attained a depth of 186 feet. The water increased to such an extent during the past few days that a suspension of work followed, and the shaft is now idle until large pumping machinery can be provided.

LEE BASIN.—The shaft-house, recently destroyed by fire, is to be rebuilt immediately.

LITTLE SLIVER.—The mine has now an output of ten tons per day, yielding a net value of about $1000. The ore in the Sliver is principally a flint, the pores and cleavages of which are filled with a chloride of silver. To all appearances, it is the same character of mineral found in the Robert E. Lee mine, and in some instances it is fully as rich in chloride of silver.

MAGNOLIA.—This property, adjoining the Henriett, worked under a lease, is showing up well at present. An eight-foot body of carbonates and iron ore is opening. Shipments will begin shortly.

ROBERT E. LEE.—In the suit of Mrs. Seymour Rogers against the Robert E. Lee Mining Company, a compromise was effected this week, the terms of which have not been made public. The case has excited much interest in this State, having been in the courts since April, 1880. Lately the decisions have been in favor of the company, and the compromise may doubtless be attributed to this fact.

PUEBLO COUNTY.

MADONNA.—The location for this company's smelter at Pueblo has not yet been definitely arranged; negotiations for land are now pending. The smelter will be supplied with four large furnaces, and will be under the management of Mr. Anton Eilers, formerly of the Arkansas Valley smelter, of Leadville.

SUMMIT COUNTY.

ROBINSON.—All work, says the Denver *Tribune*, has been resumed at the mine, and a full force of men is engaged. Guards are retained over the works, and care is taken that none of the persons opposed to the present management is admitted.

DAKOTA.

FATHER DE SMET.—The report of the superintendent from February 1st to February 8th shows ore extracted from first, second, and third levels, 1730 tons. Ore milled, 1680 tons. Water short from 3d to 7th inst. Third level, header advanced 9 feet. Header in 128 feet. Italian winze advanced 8 feet. Winze down 41 feet. We have resumed work on North End tunnel, commencing at a point about 25 feet back from face, and 790 feet from mouth of tunnel, turning and following the vein in a southeasterly direction. It has advanced 15 feet. Tunnel in 805 feet.

H. O. W. COPPER COMPANY.—This property is reported to be the only copper mine opened in the territory. The ore-body is said to be enormous, the uncovered portions of the veins being upward of sixty feet wide, averaging 16 per cent of copper. By assorting the ore, the present smelter of 30 tons daily capacity can be kept in constant blast on 30 per cent ore. The ores are mostly carbonates and oxides, entirely free from sulphur.

GEORGIA.

The Dahlonega *Signal* says:

BARLOW.—The formation is very soft at this mine, and caving is constantly going on, which keeps the cut full of ore and the mill well supplied without any extra efforts.

COLUMBIA.—The mine is shut down, but will doubtless resume operations shortly.

CONSOLIDATED GOLD MINING COMPANY.—The twenty-stamp mill is crushing ore from the Ivey cut. Work on the new sixty-stamp mill will be resumed before a great while. The cut at the Bast mine is widening and extending northeastward. The quartz leads lying back of the sandstone, quartz, and conglomerate ores are prospecting, with satisfactory results.

SINGLETON GOLD MINING COMPANY.—The twenty-stamp water-power mill at the Lockhart mine will soon be ready for operation. The little mill is making very good time on ore from the stope on the seven-foot vein.

IDAHO.

BANNER.—A correspondent of the Idaho *Statesman* states that while driving the tunnel two ledges were struck. The first ledge is the one on which the shaft was sunk to the depth of 104 feet last winter; the second is the one the uprise is making on this winter. The rise is now up about 50 feet; it will have to be extended 20 feet farther up, and then there will have to be a drift run north to intersect the shaft. The assays made give good results.

EMPIRE STATE.—This mine is now worked by Chinamen. At present, a drift is running on the vein, to connect with the old shaft and winze. The miners have run to within 48 feet of the winze and have encountered very rich ore in the face of the drift. Two hundred and twenty-eight feet more are to be run before the old shaft is struck. Good ore was found in the shaft as deep as it was sunk, and fine ore is to be found in the bottom of the winze, which is 82 feet deep. The distance from the old shaft to the north winze is 180 feet, and rich ore is known to exist between these two points for the entire distance. When the drift reaches the shaft, there will be a pay-chute 228 feet long by 82 feet high. As soon as the drift reaches the winze, stoping will be commenced.

FAR WEST AND DAVITT MINES.—These mines, situated on Deer Creek, were recently sold for $40,000.

MAYFLOWER.—The Wood River *Times* states that the lower level, which is in 270 feet, continued so long in porphyry that the superintendent started miners at work 70 feet from the breast, toward the mouth, at cross-cutting, and recently the ore-body was cut as rich as in the upper workings.

MAINE.

SULLIVAN.—Good progress at the mine is reported. The perpendicular shaft is nearly 400 feet in depth, and is going down at the rate of eight feet per week.

MINNESOTA.

Messrs. S. P. Ely, of Marquette, and George H. Ely, of Cleveland, have united in the purchase of an interest in the Minnesota Iron Company's mines, Vermilion Lake District. According to the Marquette *Mining Journal*, this purchase was made after a visit of inspection to the mines by the first-named gentleman last month, which fact is a high indorsement of all that has been said concerning this new iron field. Analyses of Vermilion Lake ore, made from a hundred samples taken from the Minnesota Iron Company's three mines, gave 67·70, 68·51, and 69·30 per cent of metallic iron, and from ·030 to ·078 of phosphorus. That ore will pass inspection anywhere.

MONTANA.

LEXINGTON.—In a communication to the Salt Lake *Tribune*, Mr. Medhurst, general manager, says that the shipments of bullion from the Lexington Mining Company for the month of January amounted to $89,049.66. The new mill having been shut down in the beginning of the month about thirty-six hours, in order to make repairs, necessary by a continuous run of over one hundred days, caused the output for January to run about $4000 under the average output of the previous three months. The average chlorination for January was 86 per cent, and the average amalgamation for the same month was 97·7 per cent, from which figures you will perceive that the Stetefeldt furnaces continue to work most satisfactorily.

NEW MEXICO.

The copper furnace in the Hubbs smelter is up and ready for work. The Albuquerque *Journal* says that owners of copper ore are requested to correspond with C. L. Hubbs. He will pay the highest cash value for copper ore on delivery at the smelter.

TREASURER.—This mine has a tunnel 20 feet in length, and the vein is 12 feet in width. The ore is pyrites of copper, and will average about 15 per cent, 12 feet from the surface.

NEVADA.

ALEXANDRIA.—Work is actively pushed. The new hoisting-works are completed on the Diligence shaft, and the engine is in its place. A force of men is engaged retimbering the shaft preparatory to sinking.

EUREKA CONSOLIDATED.—The Ruby Hill *Mining News* says that the prospects for a body of ore are very flattering at the old Wintzel works. A favorable formation has been passed through, consisting of soft lime with large boulders of hard lime at every few feet. The drift is now in broken limestone, with large crevices in the face, from which a current of air is issuing.

TUSCARORA.

NORTH BELLE.—The shaft has reached a depth of nearly 300 feet.

UTAH.

A dispatch from Salt Lake City says that a new company has been organized in London to work the famous Emma mine, which is now said to promise well. The articles of association have been filed with the secretary of the territory. The capital is £700,000 in £10 shares.

GERMANIA.—According to the *Tribune*, the operations in manufacturing lead have already made a material difference in the shipments of lead, and this difference will become more and more apparent to the great advantage of the country. These lead-works are now in full tide of successful operation.

MAMMOTH.—Capt. John W. Plummer has assumed entire control for Mr. Butler Johnston, as manager of all the property of this company, which includes the Mammoth mines (recently purchased), the smelting-works, etc.

FINANCIAL.

Gold and Silver Stocks.

NEW YORK, Friday Evening, Feb. 23.

The mining market this week has been rather quiet; but this is due, in a great measure, to the holiday. Considerable strength has been shown by the better class of stocks, and the general market may be said to have been steady, with a tendency to stronger prices.

The chief interest in the market has been the stock of Horn-Silver, which has grown very strong. Reports from the mine state that it is now looking better than for a long time past. Sierra Grande has also shown considerable strength, but evidently under manipulation. The Comstocks show little change in prices, while the Leadville stocks have been steady throughout. The Tuscaroras show a slight decline, especially Navajo. Sonora Consolidated continues to occupy most of the attention of the market, and continues to grow stronger, under manipulation. We give a summary of the market below. The total number of shares sold at all the Exchanges aggregates 404,410, as against 501,725 last week.

The Comstock shares have been quiet at irregular prices. California had a small business at irregular prices, selling from 26@21@23c. Consolidated Virginia was irregular, with a moderate business, and sold from 63@53@58c. Sierra Nevada was quiet and weak at $4.25@$3.55. Union Consolidated had a moderate business at irregular prices, but closed strong; it sold from $4@$5. Ophir sold to the extent of 400 shares, at $3.25@$2.90. Best & Belcher records a small business; it sold from $4.75@$4.38. Sutro Tunnel was active and steady selling from 21@25@22c.

The Leadville stocks had a fair business and have been steady. Amie sold from 21@22c. under a very active business. News from the mine states that the lessees of No. 3 shaft are shipping about 100 tons of ore per day, averaging from 50 to 75 ounces of silver to the ton, that there is more ore in sight than can be extracted before the lease expires, and that no development-work has been done by the lessees for some time past. Chrysolite has been very quiet and steady, selling from $1.40@$1.45. Hibernia sold from 3@5c. under a small business. Iron Silver was strong, and had a fair business; it sold from $2.80@$2.85. Leadville records but one transaction, and that at 70c. Little Chief was quiet and steady, selling at 42@40c. Little Pittsburg was also quiet and steady; it sold from 63@66c. Big Pittsburg sold at 20@19c.; this company has been reorganized. Climax had a fair business at steady prices, selling at 8@9c.

The Bodie stocks were very quiet and showed signs of weakness. Bodie Consolidated sold from $1.80@$1.70, with a small business. Standard was quiet and steady; it sold from $5⅝@$6, with a business of 385 shares. Bulwer had a fair business, and was a little weak; it sold from $1.05@97c.

The Tuscarora stocks were quiet and steady. Grand Prize was quiet and steady at 60@62c. Navajo declined from $6⅜@$5½ under a business of 1600 shares. Independence sold at 70c. North Belle Isle records a small business at steady prices, selling at 55@63c. Elko Consolidated continues active, but has declined from its recent strong prices; it sold from 9@13@12c.

In the miscellaneous list, Alice has had a moderate business at strong prices, and has sold from $2.90 @$3.55. Bassick has declined from its strong prices of last week, selling from $9@$8¼@$8⅛ under a small business. The Green Mountain stocks have been quiet and weak. Gold Stripe sold at 8c. Green Mountain declined from 80@69@70c. under a small business. Rising Sun sold at 8c. and Cherokee at 6c. Hall-Anderson has had a fair business, but has been weak; it sold from $1.75@$1.55@$1.60. Horn-Silver has been very strong, with a fair business, selling from $5⅝@ $7⅝@$6⅛@$7⅛. Ontario has been quiet and very irregular, selling from $25@$20@$24⅛. Robinson Consolidated has been very active at irregular prices; it sold from $1.05@$1.25@$1.10. Sierra Grande has gained considerable strength under a very active business; it sold from $2.65 @$3.50, closing at $3.25. It is reported that the mine is now producing from 6000 to 10,000 ounces of silver, and that the total output for six months from July 21st, 1882, to January 5th, 1883, was $869,138.88. Silver King has been quiet and irregular, selling from $11¼@$10⅝@$11⅛.

Alta-Montana records an active business at irregular prices, selling from 9@11@15c. Bradshaw was quiet and irregular at 34@31@32c. Decatur records a very active business, and has been steady; it sold from 12@10c. Harlem M. & M. Co. had a fair business at steady prices, selling from $1.15@$1.20. Oriental & Miller was active and steady, selling at 15 @13@14c. Red Elephant records a moderate business at steady prices, selling from 7@8c. Silver Cliff was irregular, under a small business, and sold from 37@42@39c. Sonora Consolidated was very active, and has grown stronger; it sold from 28@34c. South Pacific was active and a little weak at 8@6c. The State Line stocks have been moderately active at weak prices; Nos. 1 and 4 sold from 4@3c., and Nos. 2 and 3 from 8@7c. Taylor-Plumas has been active and irregular, selling from 18@16@17c.

It now looks as if the days of the American Mining Stock Exchange were numbered. The Mutual Trust Company, which acts as financial manager and cashier of the Exchange, recently informed the members that they would be required to pay dues to the amount of $100 by the 1st of March or lose their seats. This notice has caused widespread consternation and alarm. There has been little or no business done at the Exchange for a long time past, but the sales of the day appeared (on paper) as large, and sometimes larger than that of its opponent, the New York Board. It will no doubt help speculation in mining stocks to have the business centred in one exchange, and the quicker it is placed in that one exchange, and in good, reliable hands, the better.

The Big Pittsburg Mining Company has been reorganized and a new company formed, under the name of the New Pittsburg Mining Company. The capitalization has been fixed at 200,000 shares of the par value of $10, and the shareholders of the old company can exchange their stock for that of the new by surrendering their stock and an additional payment of twenty-five cents per share. The gentlemen forming the new company are W. Van Norden, who is the President, Walter S. Gurnee, R. H. Laimbeer, George R. Blanchard, Joseph S. Decker, William N. Cromwell, and J. F. Alexander. The new company has purchased the property of the Big Pittsburg, and it is going to start work immediately. It states that it believes it is a good mining property, but has never been properly worked; that it remains to be seen what there is in it; but it has strong hopes that the results will justify the outlay.

The Board of Directors of the Tombstone Mill and Mining Company, at their meeting in Philadelphia, on the 20th inst., directed the payment of another installment of twenty-five thousand dollars ($25,000) on their funded debt, being from the proceeds of their tailings. The officers were also directed to prepare reports for the approaching stockholders' meeting.

MEETINGS.

Crooke Mining and Smelting Company, No. 234 Broadway, Room 34 New York. Annual meeting and election of trustees, March 6th, at eleven o'clock A.M.

North Star Mining and Smelting Company, No. 234 Broadway, Room 34, New York. Annual meeting and election of trustees, March 6th, at one o'clock P.M.

Robinson Consolidated Mining Company, No. 54 William street, New York. Annual meeting and election of trustees, March 6th.

DIVIDENDS.

The Father de Smet Consolidated Gold Mining Company, of Dakota, has declared dividend No. 26, of twenty cents a share, payable at the office of Laidlaw & Co., No. 14 Wall street, New York, on February 28th. Transfer-books will close on February 21st.

The Sierra Grande Mining Company, of New Mexico, has declared a dividend (No. 5) of $100,000, or twenty-five cents per share, payable March 3d. Transfer-books close February 24th, and reopen March 5th.

PIPE LINE CERTIFICATES.

Messrs. Watson & Gibson furnish the following *résumé* of the petroleum market for the week:

There has been no special feature to speculation during the week, and the volume has been light and fluctuations small. It is said that the oil certificates are scarce in Oil City, but they are plenty in the New York market. The only inference from this would be, that the New York public believe in higher prices and are absorbing the certificates, and that Oil City speculators have sold short on the late spurts. Many of the most successful traders "buy on slumps and sell on jumps." There have been several small wells opened in the Forest County tract, but the territory there is so spotted and irregular that no great hopes are entertained of finding large and permanent producers. We said last week that prices for a few weeks would probably hover about the dollar mark. We believe that the best informed traders as a rule are buying rather than selling at to-day's prices, say, $1.00¼, but the market is dull. A movement looking to the consolidation of the Petroleum Exchange and Mining Stock Exchange is in progress, and if this can be accomplished, New York will certainly control speculation in oil within a few months.

The following table gives the quotations and sales at the New York Mining Stock Exchange:

	Opening.	Highest.	Lowest.	Closing.	Sales.
Feb. 17...	$1.01⅜	$1.01¾	$1.00⅝	$1.01	368,000
19...	1.01½	1.01⅝	.99⅞	1.00⅝	309,000

REVIEW OF THE SAN FRANCISCO MARKET.

There is no news of special interest from the San Francisco market. Business has been dull, but prices have been firm. The north-end Comstocks have been in good demand at strong prices. The Tuscaroras remain steady.

Copper and Silver Stocks.

Reported by C. H. Smith, 15 Congress street, Boston, Stock Broker and Member of the Boston Mining and Stock Exchanges.

BOSTON, Feb. 21.

There has been a little more activity in the market the past week, but it has been wholly confined to the four or five principal copper stocks. Prices, however, have been fairly sustained, with, in one instance, quite an advance over last week's quotations. Calumet & Hecla holds steady at $243, all the lots offered being taken at that price. Franklin opened at a decline from $123¼@$123¼, but subsequently advanced to $13, and closed quite strong at $123¾ bid. Pewabic has again come to the front and become quite

Digitized by Google

active, opening at $7\frac{1}{8}$, and advancing rapidly, with but few sales between, to $9\frac{1}{8}$@$10; closing sale to-day at $9\frac{3}{4}$. We hear no reason assigned for the advance other than that it was too low, and the low price tempted buyers. Quincy ruled steady at $50\frac{1}{8}$ @$50\frac{3}{4}$ in the early dealings, but on free offerings the price was forced down to $50, with a sale of 50 shares at $49, seller 4 months. Osceola, firm at $31@$30\frac{7}{8}$. Sales of Allouez at $2\frac{1}{8}$. The above comprise all the copper stocks dealt in the past week. The speculative list continues dull and inactive, and there is no indication of a boom in this class in the near future.

In the silver stocks, business has been unusually light. Only 20 shares of Bonanza reported at $2\frac{1}{8}$. Catalpa and Crescent, dull; the former sold at 85@ 80c., and the latter sold at $37\frac{1}{2}$c. Sullivan declined to 75c. San Pedro, quiet at 75@80c.

At the Boston Mining Exchange, Massachusetts & New Mexico advanced to 10c., with large sales; but the price was not sustained, and it again receded to 7@8c., closing 8c. bid. Empire is in better demand, and advanced from 20@24c. Pipe-line Certificates ruled from 99¼c.@1.02\frac{1}{4}$, with quite an active business in them.

3 P.M.—There was no feature to the market this afternoon. Business, as usual the day preceding a holiday, was generally neglected, and consequently sales were light all round. Quincy sold at $50; Harshaw, 75c.; Catalpa, 77½c.; Osceola, $31. Closing prices as follows: Allouez, 2\frac{1}{8}$ bid. Atlantic, $14 asked. Antimony, $13 bid. Bonanza, $2¾ asked. Catalpa, 75c. bid, 77½c. asked. Crescent, 40c. asked. Harshaw, 75c. bid. Huron, $1¼ asked. National, $1 bid, $1½ asked. Osceola, $30¾ bid, $31 asked. Pewabic, 9\frac{1}{2}$ asked. Quincy, $49¾ bid, $50 asked. Silver Islet, $5 bid. Sullivan, 75c. bid, $1 asked.

BULLION MARKET.

NEW YORK, Friday Evening, Feb. 23.

The advanced rate at which the Indian Council bills were awarded on Thursday in London has strengthened the silver market, as our rates in the accompanying table set forth; but at to-day's figures, the market abroad and here is somewhat unsettled.

IRON MARKET REVIEW.

NEW YORK, Friday Evening, Feb. 23.

American Pig.—Makers of standard and choice brands still stubbornly resist any effort to depress prices, and the dead-lock continues with no prospect of changing until matters in Washington have assumed a more satisfactory shape. Meanwhile, small lots of outside brands of pig-iron, chiefly from Pennsylvania, are coming into the market, and are sold for what they can bring, demoralizing the little current trade there is. It is conceded that stocks in the hands of makers are now somewhat greater than they were a year ago; but this is not, under the present exceptional circumstances, a very alarming or disquieting state of affairs. We quote $23.50@$25 for ordinary to standard No. 1 Foundry, and $22@$23 for No. 2, Gray Forge remaining unchanged at $20@ $20.50, all at tide-water. Bessemer pig is dull and unchanged, both here and in England. Nothing has been done in spiegeleisen, which is nominally $32.50 @$33 for 20 per cent; $26@$27, for 10 to 12 per cent.

Scotch Pig.—Importers maintain a firmer attitude, chiefly, it seems, because of the upward tendency of freights, which are now 6s. 6d. from Glasgow to this port. We are unable to note, however, that buyers are at all shaken out of their expectant attitude, and business consequently is dull and lifeless. We quote Coltness, $24.75@$25.25; Glengarnock, $22@$22.50; Langloan, $24.50@$25; and Eglinton, $21@$21.50. The Wall Street Exchange has received the following Glasgow quotations by wire to-day: Carnbroe, 55s. 3d.; Gartsherrie, 61s. 9d.; Summerlee, 62s.; Coltness, 64s. 9d.; Langloan, 65s.; Glengarnock, 55s. 3d.; and Eglinton, 49s. 6d. Warrants were 47s. 4d.

Rails.—With the exception of small sales aggregating about 5000 tons, at figures varying according to place of delivery, but equivalent to about $39 at mill, nothing has been done. Buyers appear to expect a further decline. England cables £5@£5 5s. Mr. James M. Swank's production statistics will be found elsewhere.

Old Rails.—We hear of no business worthy of special mention, and quote Old Ts, $24.50@$25; and D. Hs., $27.25@$27.50.

Scrap.—Nothing has been done. Quotations are, nominally, $25 ex ship.

Philadelphia. Feb. 23.

The iron situation in Pennsylvania has not materially changed from that detailed last week. The cause of the quietness and dullness is chiefly the pending legislation and the growing uncertainty in the minds of consumers as to the probable effects of the long agitation upon the general trade interests. The strong companies of both crude and finished iron are resting easily on their oars; but the weaker makers in both branches are full of apprehension, and very anxious that a conclusion be reached promptly. Competition has not depressed prices much during the past week, as they have already reached bottom limits at present cost of production. It is the purpose of those in charge of iron interests at Washington to throw the legislation into the next Congress, unless certain results can be accomplished in this. They feel themselves able to do this. During the past week, a large number of small transactions in Foundry iron were closed at prices varying from $24.50, delivered, to as high as $26, though the general price is under $25. The furnace companies are not over-anxious to press stocks of good iron on the market, because they believe that the accumulation in Eastern Pennsylvania is not sufficient to demand concessions, in view of the probable expansion of demand as soon as buyers can venture out. It is true, according to careful investigation, that consumption has been restricted much of late, but this has been due to a cautious policy rather than to any actual necessity. All sides have drawn in as much as possible, in order to protect themselves, and the undercurrent of opinion is, that demand will assume normal proportions just as soon as the tariff bill is placed. Correspondence from both East and West exhibits this feeling, and it is confidentially asserted in iron circles. The consumption of Mill iron has fallen to a minimum, and prices are steady at about $20.50@$21.50, although, where special brands are sold, a little higher figure has been obtained. The furnaces in the West have more iron than those in the East. Muck Bars are moving in small lots at $37. Charcoal and Anthracite blooms are selling in small lots at steady figures. Agents report the average production, which is taken up. Merchant Bars: All the mills are creeping along on their hands and knees waiting for something to happen which will induce buyers to place orders for spring requirements. Selling prices run from 2·20@ 2·30c. A few manufacturers have endeavored to find buyers for large lots at about 2·30c., but have failed. Ordinary irons are to be had as low as 2c. in country mills, but the average is 2·10@2·15c. Western iron has been delivered in Middle Pennsylvania at 2c., and this fact has led to the reduction in the East. It is impossible to speak with much encouragement of the immediate outlook, but the expected early termination of tariff legislation leads both manufacturers and buyers to hope that whatever activity there is hidden behind the present lull will soon manifest itself. The stocks in consumers' hands are, of course, low, and manufacturers are not willing to stock up. Inquiries for car-load lots of nails have been made, and several lots shipped West. Quotations are $3.30@$3.40, but sales have been made at less, and this fact has given rise to some complaints among Western makers of the action of Eastern men. The restrictive policy will be maintained from time to time. The Western mills began work last Monday morning for three weeks, and will then be idle two. Inquiries from consumers, both East and West, indicate an active demand for nails, and a desire to place orders at present figures before the upward tendency hardens prices. The nailmen are in good humor, and expect to do a large business. Wrought pipes and tubes are moving freely, but in small lots, at about 65@70 per cent off, and boiler tubes are in fair demand at 55 off. Manufacturers of cast pipes have received large orders in different portions of the country, and there are inquiries coming to hand for additional supplies. Bessemer pig-iron is quoted at $22.50. There are inquiries in hand for supplies, but buyers are not satisfied with terms. Bridge plate and boiler plate are purchased in small lots at concessions. Galvanized and thin sheet are in demand for early delivery, and makers are turning out enough to meet requirements. Stocks are not large. Plate irons of all kinds are dull, although the inquiries since last Monday show a slight improvement. Buyers are able to obtain concessions, and this is leading to a little more business. The undertone feeling among consumers is, that the settlement of the tariff question will stimulate trade, and those who have present requirements are now endeavoring to cover them at the low prices prevailing. The movements in the hardware trade are not of special interest, though the shipments for the past week show a little improvement over last in season goods. Steel rails are without any activity except in small lots at about $40. Rumors have prevailed of larger transactions at concessions, and it is not improbable that transactions of this kind will be brought to a close in a short time; but so far as can be ascertained, makers are not anxious to depress the market. It is said that large orders could be placed at $38@$39, though none have been heard of at this figure, and $40 is claimed to be a fair quotation. Some complaint emanates from Western railmakers as to business; and owing to the uncertainties as to foreign supplies reaching tide-water markets, they do not feel certain of an active spring trade. Double-heads are not in the market, but are quoted at $27.50. American are selling in a small way at interior points at $27@$28, according to location. Scrap is without any activity.

Cleveland. Feb. 21.

The iron and ore markets here are in a very unsatisfactory condition, from a number of causes. Overproduction in all branches has been going on for some time, and mills have been running at a loss. The uncertainty of the tariff question causes consumers to put off buying, or to purchase only in a hand

to-mouth way. The large failures of late cause a feeling of distrust in the trade and a tightening of credits among the banks. We think the general foundry trade to be in good, fair condition, with prospects of plenty of work for the year, but at low prices.

The mills are not so well off, and without a large reduction in the cost of manufacture or much better prices for finished iron, the outlook is dark. There have been no large sales made for some time. Trade in foundry irons in small lots is very good, and should more confidence be established and consumers purchase ordinary stocks, there would be a slight stiffening of prices, as stocks in furnace hands of good iron are small.

There is nothing doing in the ore trade. The present year's prices have not been made and probably will not be made known until stocks on docks here are disposed of. We quote :

METALS.

NEW YORK, Friday Evening, Feb. 23.

Copper.—The market has somewhat recovered, and we hear of no sales at the extremely low prices spoken of in our last. Much thought has been given to the position of the metal of late by those interested in it; and from what we have been able togather, the feeling is by no means as gloomy as some would make it. The possibility of a more liberal export of black copper from Arizona and New Mexico, by way of New Orleans and Galveston, to English markets, is beginning seriously to engage attention, and there are those who predict that a pool of producers of Western copper will be attempted with a view to follow the tactics so long and so successfully followed by the Lake companies. It can not be denied that there are very serious obstacles in the way of such a scheme, but that something must be done is pretty generally felt. Well established brands of copper have some support against such fluctuations in the market as we have been experiencing; but even they are unfavorably influenced, and it is better that, if the foreign market will stand it, we should get rid of a surplus there at present rates than force all the metal here down toward the export figure. Lake is weak at 17¾@17⅞c., with very little offered and very little demand. Baltimore is quoted 16¼@16½c.; outside brands, 16c.; and Arizona, 16¾c. London cables £65 10s. for Chili Bars, and £72@£72 5s. for Best Selected.

Tin.—Tin has weakened somewhat in sympathy with the general decline of the entire metal trade. Sales have aggregated from 200 to 300 tons, and quotations now are 20⅞c. for Straits, 21c. for Malacca, and 21⅛c. cash for Australian.

Lead.—The dead-lock still continues. Holders ask 4·60c. for Common, and the majority of buyers decline to touch lead at more than 4·50c., only one buyer offering to take a 100-ton lot at 4·55c. Refined lead is vainly offered at 4·60c.

Messrs. John Wahl & Co., of St. Louis, wire us as follows to-day :

The market remains about the same; if any thing, a shade weaker. Sales will not aggregate 270 tons of Refined lead at 4·22½c., and 170 tons of Hard lead at 4·15@4·19c.

St. Louis is, therefore, slightly better than this market.

Spelter.—The market here is dull, and business is restricted to occasional car-lots at special figures. Ordinary Western is still offered here at 4·57c. Some of the producers decline to sell at these figures. It is maintained by some that the signs of an early change for the better are becoming visible.

Antimony.—Very little has been done, the metal weakening further. We quote nominally, 10c. for Hallett's, and 11c. for Cookson's.

Quicksilver.—We remark an active export demand, which is consuming all the local product and the old stock of 2000 flasks held by one house for two years or more. The spot price is 34½@34¾c.—*San Francisco Commercial Herald.*

COAL TRADE REVIEW.

NEW YORK, Friday Evening, Feb. 23.

Anthracite.

The anthracite coal trade is dull and lifeless and is decidedly in buyers' favor. There is very little of interest to report, except that one company found it necessary, in order to move coal afloat, the bulk of it being stove and egg, to make a concession on the price. This, we understand, was, however, only temporary, and is not now, so far as we can learn, continued.

Mr. John H. Jones, official accountant, has issued the following statement of the anthracite coal tonnage for the month of January, 1883, compared with the same period last year :

	January, 1883.	January, 1882.	Differ'ce.
Philadelphia & Reading RR.	465,510	408,367	+57,143
Lehigh Valley RR	*431,577	359,216	+72,361
Central RR. of N. J.	304,483	264,291	+40,191
Del., Lack. & W. RR.	338,260	291,514	+46,746
Del. & Hud. Canal Co.	†247,725	222,400	+25,324
Pennsylvania RR.	161,858	165,992	− 4,134
Penna. Coal Co.	102,753	96,185	+ 6,567
N. Y., L. E. & W. RR	23,573	25,942	− 2,369
Total.	2,075,741	1,833,910	+241,831

*This amount includes the production of the mines of the State Line and Sullivan RR. Co., amounting to 7,318 17 tons.

†In addition there were 33,261 tons transported from mines by the D. & H. C. Co., which is included in tonnage other interests.

The stock of coal on hand at tide-water shipping points, January 31st, 1883, was 616,759 tons; on December 31st, 1882, 562,116 tons; increase, 54,643 tons.

Bituminous.

For current business, the trade is exceedingly dull and quiet, and what movement there is is confined to deliveries on old contracts. We understand that the first contract of the season, 75,000 tons to the Eastern Railroad, has practically been closed at a low figure. This is doubted in some quarters, because complications have arisen between the Baltimore & Ohio Railroad and the Pennsylvania Railroad, in regard to the freight rates from the Cumberland and Clearfield regions. It seems that by some misapprehension the Baltimore & Ohio rates were computed on the distance from Piedmont instead of from Cumberland, thus giving shippers of Cumberland coal over the Baltimore & Ohio Railroad an advantage of 23 cents over their competitors shipping Cumberland coal via the Pennsylvania system and the shippers of Clearfield coal. It is understood that the matter is under investigation now. We quote for current business unchanged, $4.50 @$4.60 alongside for Clearfield; and $4.55@$4.75 for Cumberland.

STATISTICS OF COAL PRODUCTION.

Comparative statement of the production of anthracite coal for the week ended February 17th, and year from January 1st :

TONS OF 2240 LBS.	1883.		1882.	
	Week.	Year.	Week.	Year.
Wyoming Region.				
D. & H. Canal Co..	42,395	408,573	46,718	373,360
D. L. & W. RR. Co.	71,814	520,083	63,380	470,048
Penna. Coal Co.	20,301	145,518	14,096	111,555
L. V. RR. Co.	10,840	117,164	12,910	125,484
P. & N. Y. RR. Co..	2,637	22,815	3,117	21,159
C. RR. of N. J.	45,521	265,856	53,042	253,394
North & West Br. RR.	11,703	63,171	.....	.....
	205,211	1,543,180	193,272	1,355,000
Lehigh Region.				
L. V. RR. Co.	53,137	527,292	63,617	455,316
C. RR. of N. J.	39,445	238,720	29,236	215,513
L. H. & W. B. RR.	.....	2,475	.....	1,223
	92,582	768,487	92,853	672,052
Schuylkill Region.				
P. & R. RR. Co	85,569	719,077	96,384	638,200
Shamokin & Lykens Val.	24,548	146,102	19,029	151,032
	110,117	865,179	115,413	809,232
Sullivan Region.				
State Line&Sul.RR.Co.	831	8,181	1,382	6,274
Total	408,741	3,185,027	402,920	2,842,558
Increase	.....	342,469	.....	.....
Decrease	.....	.....	.....	.....

The above table does not include the amount of coal consumed and sold at the mines, which is about six per cent of the whole production.

Total same time in 1878	2,819,392 tons.
" " " " 1879	2,562,750 "
" " " " 1880	2,620,529 "
" " " " 1881	3,014,453 "

The decrease in shipments of Cumberland Coal over the Cumberland Branch and Cumberland & Pennsylvania railroads amounts to 74,816 tons, as compared with the corresponding period in 1882.

Belvidere-Delaware Railroad Report for the week ended February 17th :

	Week.	Year. 1883.	Year. 1882.
Coal for shipment at Coal Port (Trenton)	....	125	.....
Coal for shipment at South Amboy	13,895	98,129	86,819
Coal for distribution	15,114	104,555	83,344
Coal for company's use	3,340	19,207	18,159
Total	32,349	222,016	188,322
Increase	.....	33,694	.....
Decrease	.....	.....	.....

The Production of Bituminous Coal for the week ended February 17th was as follows :

Tons of 2000 lbs., unless otherwise designated.

	Week. Tons.	Year. Tons.
Cumberland Region, Md.		
Tons of 2240 lbs.	40,060	222,051
Barclay Region, Pa.		
Barclay RR., tons of 2240 lbs.	4,993	48,588
Broad Top Region, Pa.		
Huntingdon & Broad Top RR	6,855	33,893
East Broad Top	328	8,106
Clearfield Region, Pa.		
Snow Shoe	5,470	39,296
Tyrone and Clearfield	57,576	349,389
Alleghany Region, Pa.		
Pennsylvania RR.	8,702	90,457
Pittsburg Region, Pa.		
West Penn RR.	11,217	68,790
Southwest Penn. RR.	2,852	18,787
Penn & Westmoreland gas-coal, Pa. RR	36,760	189,938
Pennsylvania RR.	10,366	69,343
Total	185,569	1,138,638

The Transportation of Coke over the Pennsylvania Railroad for the week ended February 17th and year from January 1st :

Tons of 2000 lbs.	Week.	Year.
Penn. RR. (Alleghany Region)	2,149	15,948
West Penn. RR.	3,025	14,407
Southwest Penn. RR	33,963	262,576
Penn. & Westmoreland Region, Pa. RR	2,474	35,048
Pittsburg, Penn. RR.	71	151
Snow Shoe (Clearfield Region)	255	1,150
Total	41,937	329,280

THE Philadelphia & Reading Railroad and Coal and Iron companies have passed out of the hands of the receiver, and the long, brilliant financial struggle of its president, FRANKLIN B. GOWEN, is at an end.

SENATOR JACOBS has introduced in the Senate of this State a bill in which he proposes, with a view to ending the existence of fictitious mining companies, organized under the laws of the State, that every company shall report its condition annually to the Superintendent of the Banking Department. This officer is to be empowered to investigate the condition of every company which he may consider unsound, and, if he finds it bankrupt, to authorize the Attorney-General to bring a suit for the abrogation of the charter.

A MOVEMENT has been started among the friends of the late FRIEDRICH WOEHLER, the great Göttingen chemist, to erect a monument, we presume in the university with which he was connected for so many years. With Heidelberg, Göttingen shared the preference of American students, many of whom will ever remember the famous instructor at whose feet they sat. American chemists, we trust, will heartily co-operate in offering this tribute to the memory of the famous scientist. So far as we know, no organization has been as yet perfected.

THE Grand Jury has fully recognized the great differences in plan and execution between the New York and American steam heating companies upon which we have always insisted. It exonerates the former company from all blame in connection with the nuisance which has for months aroused the indignation of the citizens of New York, and refrains from indicting the latter company only because it has promised to remedy its system. How far it will be possible to counteract the radical defects to which we have alluded in the past remains to be seen.

MR. PAUL JOHNSSON, in a communication printed elsewhere, suggests an improvement in copper smelting, which we believe is worthy of the careful consideration of metallurgists. We have had occasion to present at some length the methods of Mr. HOLLWAY, and later the modification of it by M. MANHÈS, and have had valuable expressions of opinion *pro* and *con* by experienced copper smelters in this country. Mr. JOHNSSON aims at the same object, but advocates the use of the open hearth in preference to the converter. There is much force in the argument presented in behalf of Mr. JOHNSSON'S plan, which, so far as we know, is new.

MR. EDWARD ASHMEAD has compiled a series of figures showing the amount of dividends paid by public mining companies formed in England, from which it appears that 26 British mines returned, on a called-up capital of £1,033,626, dividends amounting to £161,802 in 1882, making the total to date £3,319,131; while 26 foreign mines yielded, on an allotted capital of £9,656,007, profits of £1,334,822, carrying the total dividends up to £9,304,555. The heaviest amounts are to the credit of copper mines, the low-grade pyrites ores of the Peninsula leading. Rio Tinto has a record of £455,000; Tharsis, of £284,165; Mason & Barry, in Portugal, £231,455. These properties, however, are heavily capitalized, the figures for the three companies being respectively £3,250,000, £1,136,660, and £1,851,640, the aggregate returns thus far standing £882,500, £2,686,844, and £724,849. Among the other copper companies, Cape Copper, of the Cape of Good Hope, stands far ahead in productiveness, having yielded since 1863, on a capital of £160,000, dividends footing up to £978,125, the last one being £120,000. Of the Chilian mines, Copiapo distributed £26,152 this year, making the total since 1830, on a £166,425 capital, £119,328; while Planulcillo, which appears to be getting into good shape, gave its holders £25,000 last year, on an investment of £200,000. The three Spanish lead mines, Fortuna, Alamillos, and Linares, did not do much, the returns being only £3542, £2250, and £7292. Richmond Consolidated stands forth with £54,000 on £270,000 capital, the aggregate dividends being £754,517. The two leading California gold mines, Sierra Buttes and Plumas-Eureka, kept up their record with £15,312 and £35,156 dividends, making the total £256,785 and £295,311 respectively, on a capital of £245,000 and £281,250. Birdseye Creek paid £4500, in addition to £13,500 previously, on £60,000 capital. The old St. John del Rey, Brazil, yielded only 5 per cent, while its younger neighbor, the Santa Barbara, gave double that amount. None of the vaunted Indian mines makes any returns, and from present prospects will not figure prominently for years to come.

THE BOSTON MEETING.

The success of the Boston meeting needs no advertisement. It trumpets itself. The present generation recognizes it; and the record of it on our part would be superfluous but for posterity, which we profoundly pity, because, however often it may enjoy itself, even in Boston, it can never have precisely that good time which was granted to its ancestors at the February meeting of the Institute in 1883.

It should never be forgotten that, under all the social and professional pleasures of these reunions, the essential strength and prosperity of the Institute rests upon the *Transactions*. Out of some 1200 members, not more than 100 or 200 attend any meeting; and those who stay at home have nothing to show in return for their support of the Institute but the consciousness of virtue and the value of the papers which they receive. Now, the consciousness of virtue is a good thing, no doubt; but we prefer to rely on the value of the papers. It might easily occur, for instance, to the mind of a distant member, to obtain his consciousness of virtue by supporting some other good enterprise, such as an orphan asylum, instead of the Institute.

The abundance, variety, and interest of the *Transactions* hitherto has been admitted abroad as well as at home. The tenth volume, just published, presents in its 52 papers no exception to the rule. But there was some reason for apprehension as to Volume XI., because the Colorado meeting in August last took the place of the two meetings ordinarily held in May and October, and was, moreover, rather less fruitful than usual in papers. This, by the way, is a sufficient answer to those who occasionally rise to remark that the Institute meets too frequently, and that two meetings a year would be enough. The Council has, under the present rule, authority to postpone or omit any meeting except the annual one in February. But experience shows that the number of papers presented diminishes with the number of meetings; and while this continues to be the case, we do not doubt that, with obviously advisable exceptions, the Council will continue to call three meetings annually.

The Boston meeting has nobly made up the deficiency of papers for the

Digitized by Google

year, and we may now look forward with assured satisfaction to our next volume. Of the importance of the Boston papers, we need not speak at present. Perhaps the most important, practically, was that presented by Messrs. MAYNARD and BOWER, describing the BOWER-BARFF process for the preservative treatment of cast and wrought-iron surfaces. This can not be called an entirely new subject, since the process is in wide use in Great Britain and Europe, though it has but just been introduced here. But we do not remember any description of it so full, clear, and satisfactory as this paper contains. Of the commercial importance of the subject there can not be two opinions.

Another paper which we heartily welcome is that of Professor BLAKE, describing the American metallurgy of nickel, as developed by Mr. JOSEPH WHARTON, whose merits in this connection did not for years receive the praise they deserved, but are now generally recognized on both sides of the ocean.

The interesting excursions (more numerous and more agreeable than a Massachusetts February is wont to permit), and the graceful and bountiful hospitalities enjoyed by the Institute, have been already chronicled in our columns. As for the Subscription-Dinner, we may confidently say it was as successful as it could be—without HOLLEY. He it was who initiated the delightful practice, and, by a series of splendid successes, made it an unwritten custom, from which we are loth to depart, although, after each brilliant banquet, we say to ourselves that it were better to have no more than to run the risk of breaking the charm by one failure. He it was who delighted in all the burdensome preparations; who interviewed the caterer and the cook; settled the *menu* and the toasts; determined the invitations and the seating of the guests; and, after all these herculean labors, came to the feast the most *debonair*, witty, eloquent, and happy of the whole company. The committee-men who tried at Boston to manage these difficult details as HOLLEY would have done it had many an occasion to long for his inspiring and helpful presence.

The proceedings at these banquets are, as a rule, not reported. For this course, there are many good reasons, among them this: That the people who are present invariably tell such tales of the beauty and brilliancy of the occasion as should not be brought into contact with cold type. Moreover, the true after-dinner speech should be an elegant and ephemeral trifle. It is the one form of oratory left which is not addressed to that nuisance of modern times, "a wider audience." Preachers preach for the newspapers; lawyers plead for public effect; Congressmen address "the deestrict" over the Speaker's head: let the after-dinner orator at least talk to those who hear him, and no others. In this graceful art, the members of the Institute have won no little reputation. Once print their speeches, and we fear both the art and the reputation would be gone!

But an exception may be made now and then, especially in the case of verses, like those which we reprint elsewhere, and in which Mr. BAYLES, cleverly doing for *Iolanthe* what he once did for *The Pirates*, has given us a companion-piece to "The Modern Mining Engineer." When we add that he worked these verses into a speech on the memory of Washington and the Victories of Peace, we give a new hint of the flexible style and comprehensive scope of true post-prandial rhetoric. *

CORRESPONDENCE.

[Communications will be noticed only when accompanied with the full name and address of the writer. Unless specially desired, only initials will be printed. We invite criticism and comment by the readers of the ENGINEERING AND MINING JOURNAL. Replies not intended for publication should be addressed to the Editor of the ENGINEERING AND MINING JOURNAL in blank, stamped, and sealed envelopes.]

The Question of Time in "Continuous" Pan Amalgamation.

EDITOR ENGINEERING AND MINING JOURNAL:

SIR: The absolute minimum of water that can be used in crushing wet by stamps, without decreasing results, is very far below the almost universal notion entertained by mill-men. A rule of mine is, to regulate ten stamps to fill a five-foot pan forty inches deep in twenty-five minutes. This rule was observed at Harshaw, where we crushed five tons to the stamp.

It will be seen that, in amalgamating in six pans, the time for amalgamation will be two and a half hours; and every additional pan adds twenty-five minutes to this. When well regulated, a "continuous pan" has about one half as much sand in it as is ordinarily contained in a "charged pan;" hence there is one half of pulp particles and one half the amount of precious metal to be operated upon by a pan capacity, and an amount of quicksilver alike in both cases. M. P. BOSS.

TOTAL WRECK, ARIZ., Feb. 13.

The Geology and the Copper Deposits of Adams County, Pennsylvania.

EDITOR ENGINEERING AND MINING JOURNAL:

SIR: My absence at the Boston meeting of the American Institute of Mining Engineers prevented me from noticing in your last issue the communication of Mr. J. Trowbridge Bailey in the number for February 17th. This latter is of a character to call for some comment. I do not propose to seek to elucidate the obscurities of some of his terms, such as, for instance, the apposition of "our Eastern sedimentary and primary formations;" the scope which he assigns to "the great Eastern mineral belt," etc.; but there are enough serious errors of fact in the body of the article to occupy all the space you may be disposed to give me.

The first of these, and one of the greatest, is found near the beginning of the part called "Geological Features" (of that portion of the South Mountain lying in Pennsylvania between Adams and York counties on the southeast, and Franklin and Cumberland counties on the northwest). Those of us who know this region are amazed to learn that "upon the west and north of the South Mountain in the Cumberland Valley we find a hard, compact, crystalline limestone lying *in a comparatively undisturbed state* . . . between two upheavals, namely, the South Mountain and the North Mountain." It is quite clear that no one familiar with Prof. H. D. Rogers's sections V., VI., VII., VIII., and IX., published with his final report over twenty-six years ago; or with the descriptions and sections of the present survey; or with the many papers on the subjects connected with the "Great" or "Cumberland Valley;" or, finally, with the valley itself, could employ such an expression to describe the structure of its limestone. Not only is the limestone throughout its entire extent in Franklin and Cumberland plicated in the most confusing manner, but it is in all probability divided longitudinally into two parts which represent entirely different horizons in the Lower Silurian. Nor can any but the merest fragmentary areas of limestone (very likely belonging to an older system than that of the great valley) be called hard or crystalline; nor are the mountains between which the valley limestone lies at all likely to be mountains of upheaval.

We learn that the underlying crystalline schists . . . . have been greatly dislocated and turned upward by the disturbances caused by the formation of the South Mountain," etc.; and "except where infiltration has taken place, the stratified formations are devoid of copper-bearing minerals." A "quartzitic epidote" is described as "breaking through the stratified formation;" for which misdemeanor it is called a "dike" and a "volcanic intruder." "Present in all directions, and *highly metamorphosed*, are amphibole, chlorite, and the many decomposition products of epidote." It may assist in the assimilation of the above wealth of geological description to pause and inquire whether a basic mineral like epidote can be justly called quartzitic; whether a quartzitic epidote, or, in fact, any other kind of epidote, was ever observed as a volcanic intruder; what is the present state of metamorphosed amphibole and chlorite and "the manifold decomposition products of epidote;" also, whether here, as elsewhere, the epidote be not itself a decomposition product. Farther on, we are impelled to ask what kind of metamorphosis is that due to serpentine, and how this mineral is supposed to have "broken through" the schistose or sedimentary "strata." While on this subject, and neglecting much more original matter in the same strain, it would be advantageous to know what are the characteristics of a "mineralized epidote or serpentine zone."

The region is remarkable for producing pieces of native metal weighing 27 pounds. If the writer's memory may be trusted, this was the precise weight of a hand specimen which was given to him to examine six years ago. He was unable to discover another piece of this size; and though there were found near the contact-planes of the epidotic rock and the orthofelsite many places where the rocks were filled with minute spangles of native copper, a number of analyses showed that the percentage of this copper to the mass was about 3·6 (3·36 per cent reckoned as pure copper), while the copper in combination varied from 4·35 to 4·7 per cent. On this account, it does not accurately describe the ore to speak of it as "exceptionally rich." Of course, the writer speaks of what was visible three years and more ago, and in no wise refers to developments which may have been made since. If there be such, it would be interesting to know them.

Before leaving the geological for the bibliographical treasures of this essay, it is worth while to quote one more paragraph: "The vein-matter is composed of a metamorphosed quartzitic chlorite . . without affording at the point of contact" (with the walls) "any signs of clayey decomposition or other features so characteristic of fissures. It presents *all the appearance of being a fault or slip* in the country chlorite." The problem here is, how could a fault or slip exist without a fissure? and how could vein-matter be a fault or slip?

As to the bibliography, this very refreshing sentence comprises it all. "Although the locality has been frequently the subject of reports by a number of engineers, other than a mere casual reference has never been made to these geological characteristics."

Interpreting this language literally, it is quite true; and it would not be too hazardous to prophesy that no engineer, if he have a small foundation of geological theory and practice, is likely in the future to make other than a casual reference to the geological characteristics of which the preceding quotations are examples. But this is quite clearly not what Mr. Bailey means to say. He supposes that no one has properly noticed the structural and lithological geology of this region but himself. In this, it is quite easy to prove to him that he is mistaken.

In 1876, Dr. T. Sterry Hunt (after spending some weeks in 1875 with the writer in this region) published his views of these rocks. The writer's two volumes C and CC, containing the reports of progress for 1874 and 1875, treat of the relations of the series of rocks involved in the phenomena of the copper belt. In 1877, the writer printed in the *Polytechnic Review* (April 21st and 28th), an article on the Copper Ores of Pennsylvania, in which special prominence is given to the geology of this region. In 1878, Dr. Hunt published Report E, containing his views on the origin and genesis of these horizons of the South Mountain chain *in extenso*. At the Baltimore meeting of the American Institute of Mining Engineers, February, 1879, Mr. Blandy presented a paper on this region, which was discussed by Dr. Hunt and the writer, especially in its geological features. [Transactions of the American Institute of Mining Engineers, Vol. VII., p. 337.] Finally, in Volume CCC, Second Geological Survey of Pennsylvania, 1880, Appendixes 1 and 2 are chiefly given up to the study of this very region. It is true that all of us who have toiled along in darkness as best we might before the advent of Mr. Bailey may be quite wrong; but if we "don't know," we at least should be accorded the meed of justice that Dick Deadeye allows the Admiral in *Pinafore*—we "mean well," and really ought not to be so cruelly neglected; for it is not every one who can approach a difficult geological problem like that of the copper region of Adams County with a mind as freed from the prejudice due to numerous and conflicting previous experiences as is that of Mr. Bailey.

PERSIFOR FRAZER.

THE BOSTON MEETING OF THE AMERICAN INSTITUTE OF MINING ENGINEERS.

THE FIFTH SESSION.

The final session of the Institute was held on the morning of Friday, the secretary submitting a report showing that the finances of the Institute were in a flourishing condition, and that its membership had been increased to 1213. The election of officers was announced as follows: *President*—Robert W. Hunt, Troy, N. Y. *Vice-Presidents*—S. F. Emmons, Denver, Colo.; W. C. Kerr, Washington, D. C.; S. F. Wellman, Cleveland, O. *Managers*—John Birkinbine, Philadelphia, Pa.; Stuart M. Buck, Coalburg, West Va.; E. S. Moffatt, Scranton, Pa. *Treasurer*—Theodore D. Rand, Philadelphia, Pa. *Secretary*—Thomas M. Drown, Easton, Pa.

Professor Dr. Persifor Frazer then read an elaborate paper entitled the Eozoic and Lower Paleozoic in South Wales, and their Comparison with the Appalachian Analogues. As many members desired to leave by an early train, the time at Professor Dr. Persifor Frazer's disposal was necessarily limited. Dr. T. Sterry Hunt, however, as briefly as possible outlined the points which led him to accept opinions contrary to those of Mr. Frazer, but necessarily justice was not done to the subject under the circumstances.

After the transaction of routine business, the meeting adjourned. Later, a party of about sixty members of the Institute took a train courteously furnished by the Boston & Lowell Railroad, and under the guidance of Professor Richards and Messrs. Eustis and Leavitt, went to Lowell, where they were received by Mr. J. B. Francis, by whose invitation the visit was made. He took charge of the excursionists, conducting them in carriages to his residence, where lunch was served. Mr. Francis, the foremost of living American hydraulic engineers, planned the present elaborate system of utilizing the water-power at Lowell, and is conspicuously identified with similar work in other sections of the country. The Lawrence, Lowell carpet, and Merrimac mills, together with the water-power, dam, and canals, were in turn visited, and, returning to Boston, the party scattered to their homes.

SAID I TO MYSELF.

Lines read by Mr. J. C. BAYLES at the Subscription-Dinner, given by members of the American Institute of Mining Engineers at the Hotel Brunswick, Boston, February 22d, 1883.

When I was a nascent professional man,
Said I to myself, said I,
An Institute member I'll be if I can,
Said I to myself, said I.
For membership there is an honor indeed;
To the meetings I'll go with long papers to read,
And I'll do what I can when it comes to a feed.
Said I to myself, said I.

I'll never throw dust in a stockholder's eyes,
Said I to myself, said I;
Nor hoodwink an expert who's not overwise,
Said I to myself, said I.
If I'm working a mine and the ore "peters out."
Or its future is somewhat a matter of doubt,
I'll tell every body they'd better keep out,
Said I to myself, said I.

If I'm running a blast-furnace, little or big,
Said I to myself, said I,
I'll not count my cinder as Bessemer pig,
Said I to myself, said I.
My worthy profession I'll never disgrace,
By claiming of phosphorus only a trace,
When analysis shows that it isn't the case,
Said I to myself, said I.

If I work as a chemist in iron and steel,
Said I to myself, said I,
I'll never deceive, by a very great deal,
Said I to myself, said I.
I won't say that silicon vainly I've sought;
That sulphur, if present, declines to be caught,
Nor put down for manganese decimal naught,
Said I to myself, said I.

If as a geologist fortune I seek,
Said I to myself, said I,
I'll try to avoid being bashful and meek,
Said I to myself, said I;
For many geologists fail of success
Because they lack courage their views to confess,
And fear to offend if their thoughts they express,
Said I to myself, said I.

If some well-endowed college of science and art,
Said I to myself, said I,
As a learned professor should give me a start,
Said I to myself, said I,
I'll try to know something of what I'm to do;
I'll read up on subjects relating thereto,
And besides teaching science, I'll study it, too,
Said I to myself, said I.

In other professions in which men succeed,
Said I to myself, said I,
Of "cheek" and assurance they often have need,
Said I to myself, said I.
Professional modesty's pushed to excess;
The value of confidence all must confess,
And even E. Ms. need a little, I guess,
Said I to myself, said I.

COAL AND IRON IN ALABAMA.*

By T. Sterry Hunt, LL.D., F.R.S.

Coal was mined to a small extent near Tuscaloosa in Alabama, and even carried by boats to Mobile, half a century since. Professor Porter, and later Prof. R. T. Brumby, occupied themselves with the geology of the region, and it attracted the attention of Sir Charles Lyell, who visited the region. It is, however, to the two reports of Professor Tuomey, Geologist to the State, published in 1850 and 1858, that we owe our first clear notions of the geology of the Alabama coal-field. His work has since 1873 been continued by Prof. Eugene A. Smith, of the University of Alabama, whose valuable reports, extending and completing the work of his predecessor, are indispensable guides to the geological inquirer in this region. Mention should also be made of the investigations of Mr. R. P. Rothwell, who, after three years of studies in parts of the Alabama coal-fields, read before the American Institute of Mining Engineers in October, 1873,† a brief but important paper calling attention to the great deposits of coal and iron ore found therein, and their economic importance. Having myself during the past year had an opportunity of visiting parts of this region, I have thought that it might be well to bring before the Institute some facts and considerations as to its geological and geographical characteristics and the value of its mineral resources.

It is well known that the great Appalachian coal-basin, stretching southwestward through Eastern Tennessee and the northwestern corner of Georgia, terminates in Northern Alabama in what is called the Warrior coal-field, which there covers an area of about 5000 square miles. Lying along the southeast border of this, but separated by a narrow belt of older rocks, is the Cahaba coal-field, having an area of about 230 square miles; while to the northeast of this, and near it, is the Coosa field, a still smaller and little known area covering about 100 square miles. These smaller fields were evidently at one time continuous with the greater one to the west, and belong to the great Appalachian basin, from which they have been separated by folding, faulting, and erosion. They are narrow and elongated in a northeast and southwest direction.

Along the southeastern border of these coal-fields in Alabama extends a broad valley drained by the Coosa River, of which it bears the name. This is the southwestern extremity of the great Appalachian Valley, which stretches continuously from the Hudson, through Pennsylvania, Virginia, Tennessee, and Georgia. The ancient crystalline rocks of the Atlantic belt—seen in New England, the Highlands of the Hudson, the South Mountain of Pennsylvania, and the Blue Ridge—which form the southeastern border of the great valley, are still found in their place limiting the Coosa Valley until we reach the center of Alabama. The northwestern border of this valley is here defined by the eastern edges of the Coosa, Cahaba, and Warrior coal-fields, and appears in Lookout Mountain, near Chattanooga. The valley thus limited has a breadth varying from fifteen to thirty miles or more, and is furrowed by many subordinate parallel ridges.

In Central Alabama, the crystalline rocks on the one side and the coal measures on the other alike sink down and disappear beneath the transverse belt of quaternary deposits known as the Port Hudson group, which conceals the contact between the older rocks and the overlying Cretaceous strata lying to the southward.

It is instructive to one acquainted with the great geognostical and geographical divisions of the Middle States to follow these southward till they are lost in the manner just described beneath the broad plain of the Gulf States. The great Appalachian coal-basin in Pennsylvania, Ohio, West Virginia, and Kentucky is, as is well known, tributary to the Ohio, through which its waters pass by the Mississippi into the Gulf of Mexico. It has for this reason been not inappropriately called the Ohio coal-basin. Along its eastern border stretches the double mountain-line of the Alleghanies and the Blue Ridge or Atlantic belt, which separate the coal and iron from the tidal waters of the Atlantic coast. But in Alabama, we reach the southern extremity of these mountain ranges; we find the barrier broken down, and the southern part of the vast Ohio basin drained by navigable rivers flowing through a great plain to the Gulf of Mexico.

The detached coal-fields along the eastern border of the great basin, which are seen from Pennsylvania to Alabama, are often designated as outliers, and Professor Smith has aptly described the valleys with lower rocks, limiting these subordinate coal-fields, as outliers of the Coosa Valley. These, which have the northeast and southwest direction of the latter, are, first, the Cahaba Valley, separating the Coosa and Cahaba fields; and second, the Long Valley, as it is called, which separates the Cahabas from the Warrior field, and extends from below Tuscaloosa northward to Village Springs, beyond which it bifurcates, the western branch running to Sand Mountain, which terminates the valley, and the other running northeast into Georgia and Tennessee.

It is along this valley that the Alabama Great Southern Railroad passes from Chattanooga to Birmingham, and thence nearly to the southwestern end of the valley, where the railroad turns westward to Tuscaloosa, at the southeastern extremity of the Warrior coal-field. It will further aid us in forming a notion of the geography of this region if we bear in mind that the Selma, Rome & Dalton Railroad, nearly parallel with the last, runs, from the crossing of the Coosa River, northward within the Coosa Valley, and from eight to ten miles to the westward of the crystalline range which forms the eastern boundary of this valley.

There remains to be noticed a third outlying valley farther west than those already mentioned, and known as Brown's Valley. This, which is a prolongation of the great Sequatchee Valley of Tennessee, does not extend far southward, but dies out at Blount's Springs, in the Warrior coal-field. The uplift connected with this anticlinal valley, however, continues southward, and affects the strata of the coal-field.

The rocks of the region before us may, for the purposes of our present inquiry, be conveniently considered in four divisions, which are as follows, in ascending order:

I. The ancient crystalline rocks of the Atlantic belt along the southeast side of the Coosa Valley, containing occasional deposits of magnetic iron ore.

II. The various subdivisions between these and the base of the Chazy

* Read at the Boston Meeting of the American Institute of Mining Engineers.

Digitized by Google

limestone, included by Smith under the heads of the Ocoee slates and conglomerates, the Chilhowee sandstones, and the rocks of the Knox group, in which latter slate and limestone predominate and are associated with great deposits of limonite and of oxide of manganese. These rocks appear in the Coosa and the outlying valleys.

III. The rocks lying between the last and the base of the coal measures, including representatives of the Chazy and Trenton limestones, the Nashville or Cincinnati group; the succeeding Silurian, represented chiefly by the Clinton group, with its great beds of red hematite or fossil ore; a small thickness of black shale, representing the Devonian; and a considerable mass of strata, chiefly limestones, belonging to the Lower Carboniferous.

IV. The Coal Measures.—Of the first or crystalline division it is not necessary here to speak, except to say that it consists for the most part probably of rocks of Montalban age, as I have shown to be the case in the continuation of the same belt farther to the northeast in Georgia. Elsewhere, as in North Carolina, they are underlain by Laurentian gneisses, which here include the magnetites of Roan Mountain. Magnetic and specular ores of iron are, however, found in all the great subdivisions of the Eozoic rocks. A deposit of the former is said to be found in Clay County, Alabama.

As regards the second division, which is economically important from the presence of great deposits of brown hematite or hydrous iron ore (limonite, etc.), as well as manganese ore—various geological questions arise which can only be mentioned here. The same ore-bearing belt is traced continuously with constant characters from the Coosa throughout the Appalachian Valley, and is the Primal and Auroral of Rogers and the Lower Taconic of Emmons. It is quite distinct from the series called Upper Taconic by the latter, which is the Quebec group of Logan, although the two were for a time confounded. Safford, in Tennessee, gave the name of the Knox group to the older or Lower Taconic series, with which he included some limestones occasionally found in the valley of East Tennessee, containing a fauna which belongs to the horizon of the Calciferous and thus represents the so-called Quebec group. Professor Smith, following Dana, has, in his classification of the rocks of Alabama, described as belonging to the Quebec group the whole of the Knox group or Lower Taconic, measuring in East Tennessee, according to Safford, not less than 7000 feet, and consisting of sandstones with shales and limestones, including limonite. The Chilhowee sandstones and Ocoee shales and conglomerates, which occur chiefly as ridges in the Coosa Valley, and which are, in part at least, probably older than the Knox group, and correspond to the lower part of the Primal of Rogers, are by Smith referred to the Acadian and Potsdam epochs of Dana. At the summit of the Knox group in Alabama, as in Tennessee, is found a fossiliferous limestone with *Maclurea*, marking the Chazy subdivision, to which succeeds the Trenton limestone. Inasmuch as there is reason to conclude, from many observations elsewhere, that there is at this horizon a great stratigraphical break separating the limonite-bearing rocks from those above them, I have placed the Chazy with the Trenton in the third division.

The rocks included in this third division embrace representatives of all the great groups of Paleozoic rocks from the Chazy to the base of the coal measures; Ordovian (Lower Silurian or Siluro-Cambrian); Silurian (Upper Silurian); Devonian or Erian; and Lower Carboniferous. The united thickness of all these is, however, very small when compared with that of the same groups farther north in the same great Paleozoic basin. In Pennsylvania, if we take Ashburner's measured section in Huntingdon County, we have, from the base of the coal measures to the summit of the Trenton, not less than 17,640 feet, making, with the addition of the latter, more than 18,000 feet. With this measurement, other sections in the same succession in Pennsylvania agree pretty closely. It is unnecessary to recall the fact that this great thickness of rocks consists in large part of sandstones and other coarse mechanical sediments, the foldings of which give rise to the belt of mountainous country separating, in Pennsylvania and Virginia, the coal measures from the iron-bearing rocks of the great valley and its outlets.

Prominent among the ridges of the Alleghany Mountain region are those of the Oneida sandstone, the first or lowest in the intervening series of these great masses, with a thickness of 2000 feet or more, which forms what is called the North Mountain along the northwest side of the great valley, and is repeated by anticlinal folds farther west. Directly overlying this sandstone is the Clinton or red fossil ore, which extends continuously from New York to Alabama.

If now we turn from Pennsylvania to Alabama, we find that this great series of strata, which we have included in our third division, is reduced in thickness from 18,000 feet to 1000 or in places 1600 feet, consisting moreover, in great part of soft and calcareous rocks. As a result of this, the limonites, the fossil ore, and the coal, instead of being separated from each other by great belts of mountain-forming strata, are brought side by side in a comparatively level country, and are thus presented under conditions extraordinarily favorable for mining, manufacturing, and transportation.

The coal measures themselves, which constitute our fourth division, have suffered no apparent diminution in thickness. They are estimated in round numbers at 3000 feet in Pennsylvania, and are probably not less in Alabama, where one section, hereafter to be noticed, measures, according to Professor Smith, not less than 2600 feet.

The outlying valleys already mentioned are eroded anticlinals, often accompanied with dislocations of the strata, and in them are exposed the fossil ores and still lower limonites. The Long Valley, which extends from below Tuscaloosa by Birmingham northward, and in its lower and middle portions is known as Roup's and Jones's valleys, respectively, divides, as we have seen, the Warrior coal-field from the Cahaba outlier on the east, the distance between the two coal-fields being rarely over six or eight miles. In the upper part of the course of this anticlinal uplift, the strata of the third division are seen dipping regularly beneath the coal measures on each side; but toward the southwest, the beds have been sharply folded and pushed over to the northwest side, producing a real inversion, so that all the strata appear dipping to the southeast. The Lower Carboniferous limestones on the western side of the valley thus lie below the Chazy and Trenton limestones, and these again below the still older rocks of the Knox group, the whole series being overturned and folded upon itself. The structure is further complicated in parts by faults, bringing up, on the east side, the older rocks against the Lower Carboniferous limestones.

As a consequence of these accidents, so well described by Professor Smith, some of the beds are in part concealed, and others are duplicated. Conspicuous among these are cherty ridges belonging to the second division and associated with the limonites. Still more marked are the rocks of the Clinton group, known in Tennessee as the Dyestone and in Alabama as the Red Mountain group, from the beds of red hematite or fossil ore seen everywhere seen along its outcrop.

A remarkable dislocation of the strata occurs to the southeast of the Cahaba field, where white limestones of the Knox or Taconic series are brought, by a great upthrow, on a level with the highest of the coal measures, here sharply cut off and upturned. This great fault was estimated by Rothwell at not less than 10,000 feet, and his interpretation of the structure, though questioned at the time, has since been confirmed by the observations of Professor Smith and myself.

To the northward, where the coal measures still cover the anticlinal arch which divides the Cahaba from the Warrior field, it rises into a ridge or hill; but farther southward, where denudation has done its work in removing the higher strata, the eroded valley is bordered on each side by a rim of the basal sandstones of the coal measures, the tilted edges of which are still higher than the undisturbed beds of the coal-fields on each side. The result of this is the singular one that the waters of the valley break through the ridges on each side, and find their way into the Cahaba and Warrior rivers, the valley being really higher than the plains on each side of it. As a consequence of this peculiar drainage, we find that the limonite ores along the valley, instead of being buried in clay, as elsewhere is usually the case, are often laid bare, and form hillocks and ridges scarcely covered with soil.

The Warrior coal-field is divided by Smith into the plateau or table-land region on the north and the Warrior basin proper lying to the south. The southward extension of the anticlinal, which in its eroded portion farther north gives rise to Brown's Valley, traverses the field as a low ridge, and divides the basin into two unequal troughs. Of these, the one to the eastward—which is the narrowest, and is drained by the Locust Fork or Little Warrior River—is the best known, lying as it does between the anticlinal just mentioned and that of Long Valley. A section between this valley and Locust Fork, described in detail by Professor Smith in his report for 1877–78, shows above the Lower Carboniferous limestone about 2600 feet of coal measures, including a conglomerate at the base. This, from its proximity to the valley and to the railroad, is the part of the field which has been best explored, There are found in this section twelve seams of coal of from two and a half to seven feet, and having an aggregate thickness of fifty feet. Of these, five seams have been extensively mined. The strata are nearly horizontal and affected only by slight undulations. The Pratt seam—the highest in the section—which is now extensively mined about six miles west from Birmingham, yields four and a half feet of coal, with one shale parting. As mined at the time of my visit in February, 1882, from two stopes and a shaft of 250 feet deep, it was yielding from 1200 to 1500 tons of coal daily, a considerable portion of which was coked at the mines. According to more recently published statements, the production at the Pratt mine has since been much increased. Several other productive mines are opened in adjacent parts of the same field.

To the west of the division just described, the development of coal in the region drained by the Big Warrior River is not less considerable, the later surveys of Smith and others showing the existence of many excellent seams of good quality, measuring from three to six feet in thickness.

In its southern part, where the Cahaba field attains its maximum breadth of twelve miles, the measures are regular, and have a dip of from six to ten degrees along the western border, gradually increasing to twelve or fifteen degrees near Lily Shoals, on the river, and to forty-five degrees or more near to its eastern edge, where the strata along the great fault are sometimes nearly vertical. Farther northward, about thirty miles from its southern extremity, where the Cahaba field is reduced to a breadth of six miles, the strata are somewhat crushed, and the upper measures, which appear farther south, near Monte Vallo, are wanting. The field is here crossed obliquely by the Alabama North and South Railroad, along the line of which, according to Rothwell, are found nine workable beds of coal, measuring from two to four feet in thickness, and giving an aggregate of over twenty-eight feet. In the wider and less disturbed parts of the field, farther south, the coal seams are thicker. On Four-Mile Creek, the same observer found eight seams with an aggregate thickness of thirty-eight feet, besides four higher seams in the Monte Vallo beds, equal to twelve feet. Along the eastern border of the field, however, the lower coals will be too deep for profitable mining.

Besides the analyses of coals from this field given by Rothwell, an extended table of analyses of others from the Warrior basin is given by Smith in his report for 1879–1880, and it may be said, in general terms, that the coals from both these fields are equal to those from the more northern portions of the Appalachian basin. They present the usual varieties in quality and composition, some of them being dry-burning coals, others coking coals, with as much as 65 per cent of carbon, while others contain much more volatile matter.

The iron ores of the region, as already mentioned, belong to two classes, the red hematite or so-called fossil ore of the Clinton beds, and the brown hematite below. The former is almost everywhere in its place at the outcrop of the rocks of the third division throughout the Long Valley. The ore has been traced, according to Professor Smith, with very little interruption, from Pratt's Ferry, on the Cahaba above Centerville, nearly to the Georgia line, sometimes very pure, and at other times too siliceous for use. Near Birmingham, where it is mined for the Oxmoor furnace, there are seen in a thickness of thirty feet twenty-five feet of ore with interposed shaly bands. Numerous analyses of the ore mined at different points in the valley, where their thickness is from ten to twenty feet, give from 42 to 55 per cent. They are generally smelted with an admixture of the brown hematite of the region.

As regards these brown hematites, I can only say, after comparing them with similar deposits of these ores from Massachusetts southward to Virginia along the great valley, that they are of wonderful extent and richness, and, so far as my observations go, are unsurpassed. These hydrous ores have been generated, as has been shown by myself and

Digitized by Google

hers, by the alteration *in situ* of interstratified masses and layers, in me cases of carbonate of iron and in others of pyrites, included in the ore or less argillaceous strata now changed to clays.* As already plained, the washing away of a great portion of these clays, where they e exposed along the lines of uplift, has left behind a correspondingly rge amount of their included ore. From this, it results that over many uare miles along the outcrop of these lower rocks, both in the west d east sides of the Cahaba coal-field, we find a succession of hillocks mposed in great part of masses or fragments of brown hematite; while their vicinity, excavations show the same ore still imbedded in the ratified and often highly inclined clayey beds resulting from the decay of e original rocks. In some cases, the same ore, of unusual purity, is und imbedded in large irregular masses in a quartzoze rock which longs to the same geological series as the slates. It appears, from merous analyses of these ores, that they are sometimes less hydrated an limonite and approach to turgite in composition. They have long en mined and smelted with charcoal along the Coosa Valley, where they e not less extensively developed than in the outlying valley west of the ahaba field, in which district they are now mined for the furnaces of irmingham and its vicinity.

It would be foreign to my present plan to enter into details as to any rticular portion of the region before us. Its value as a whole consists the fact that it possesses coal abundant in quantity, excellent in qual-y, and situated in proximity to the waters of the Gulf of Mexico, with hich it can be readily connected by improvements of the rivers drain-g the coal-fields. From Tuscaloosa, which is on the southeastern edge the Warrior field, there is navigation throughout the year to Mobile, distance of 355 miles. As appears from a report of U. S. Engineers the War Department, submitted to Congress in 1880, there is tween Tuscaloosa and Sipsey Fork, in the Warrior basin, in a distance 92¼ miles, a rise of about 16 feet. A system of dams and locks, with ambers 145×30 feet, would suffice to establish water communication om this point, in the heart of the coal-field, to Mobile throughout the ar, for an estimated cost of $400,000. Barges laden with cotton, coal, d lumber have, it is said, for many years been sent down this way ring seasons of high water.

The Alabama River is navigable from Selma to Mobile, and the Cahaba iver, which drains the Cahaba field and falls into the Alabama a little ove Selma, can in like manner, according to official report, be made vigable at a cost of $500,000.

The present lines of railroad have done little for the development of is mineral region. Two great north and south lines, as already pointed it, the Alabama & Chattanooga Railroad and the Selma, Rome Dalton Railroad, pass down the valleys west and east of ne Cahaba field. The South & North Alabama Railroad, how-ver, a continuation of the Louisville & Nashville Railroad, which its course from Decatur to Montgomery intersects the first these roads at Birmingham, and the second at Calera, osses a small part of the Warrior field near Birmngham, and lso the narrow portion of the Cahaba field. The Georgia Pacific from tlanta, passing through Birmingham, will traverse the breadth of the arrior field. During the last years of the civil war, a line was sur-eyed and in part graded for the purpose of opening the lower part of ne Cahaba field, starting from Ashley, a little below Calera, and running orthwest and then northeast into the heart of the coal-field. It has tely been proposed to complete this work, and other projects are under onsideration for the development of the Cahaba field, where very little as been done since the close of the war, during which coal was here xtensively mined. My own observations at the old openings satisfied e of the correctness of Rothwell's observations, and showed that we ave in this field a region which, as regards the supply of coal, the prox-nity of iron ore, and facilities for mining, smelting, and transporta-on, are unsurpassed.

As regards the iron resources of the region, we may note, in the first lace, the proximity of the ore to the coal. With the limited exception f deposits of ore in the coal measures in the northwestern portions of the reat basin, it is well known that the ore and coal in the United States re generally widely separated. Not to speak of the crystalline ores of the lder rocks, the great supplies of limonite upon which the iron industry f Pennsylvania and Virginia are largely based present similar conditions. suffices to look at a geological map of these States to see what a broad elt of mountainous country separates the limonite-bearing rocks of the reat valley from the coal measures, while a very considerable interval lso divides these from the fossil ores. Owing, as already explained, to the inning out of the intervening rocks, which are reduced to less than one nth of their thickness, and to the fact that those that persist are, for ne most part, soft and crumbling, we have seen how the ores and coal widely separated elsewhere are in Alabama brought into close prox-nity. Thus, in Long Valley, a distance of six or eight miles only parates the coal-fields from each other, while abundant deposits both of ne red and the brown hematite are found in the interval between them. is not therefore surprising that this valley is rapidly becoming an portant center of iron production, where coke-made iron can be pro-uced more cheaply than anywhere else on this continent.

The remarkable dislocation and upthrow, already noticed as occurring on ne southeast side of the Cahaba field, bring about a still closer approxi-nation of iron-producing materials by lifting up the lower ore-bearing ocks side by side with the coal measures. Here, on the banks of the ahaba River, deposits of limonite of great abundance and purity are ound extending over many hundreds of acres of the surface within two iles of opened beds of coking coal, while cliffs of a pure white limestone, ell fitted for flux, are seen within the same distance. It is impossible to ok upon all the developments of coal and rich iron ores, elsewhere so idely separated and here brought into close proximity, without feeling at these Alabama coal-fields are destined at no distant time to be the eat of an immense mining and manufacturing industry.

It is true that this region is now somewhat removed from our great enters of population and consumption; but with the improvements in ater transportation now projected, iron could be carried to Mobile and hence by sea to American and foreign ports more easily than from any ther iron-producing region in the Union. Nor should we forget in this onnection what a vast future awaits the South with its newly-awakened activity in agriculture and in manufacturing industries; a region offering such advantages of soil and climate as can not fail in the next few years to attract a very large immigration. If we look to the census returns of 1880, we shall find that the eight coastal Southern States, from North Carolina to Texas, with a population of about nine and a quarter millions, showed an increase over that of 1870 of 41·6 per cent, while the increase for the Union, taken as a whole, was but little over 30 per cent. To Alabama, as the great coal and iron-producing State of the South, the chief part of this vast region may be made to a large extent tributary.

Already in 1875, the great natural advantages of Alabama for the manufacture of iron attracted the attention of Isaac Lowthian Bell, who, in a communication to the British Iron and Steel Institute, declared that the region "presents advantageous conditions for the economical production of the metal rarely met with even in Great Britain;" elsewhere asserting that it would "prove a match for any part of the world in the production of cheap iron." Not less striking is the language of Abram S. Hewitt, who says of Alabama: "It is the only place upon the North American continent where it is possible to make iron in competition with the cheap iron of England, as measured not by the wages paid, but by the number of days' labor which enter into its production. The cheapest place on the globe until now for the manufacture of iron is the Cleveland District, in Yorkshire, England. The distance of the coal and iron from the furnaces there averages about twenty miles. Now, in Alabama, the coal and the ore are in many places within half a mile of each other. This region, so exhaustless in supplies, so admirably furnished with coal, so conveniently communicating with the gulf, will be of infinitely more consequence to us for its iron than it has ever been for its cotton. The ore is the foundation of an industry and a prosperity which no curse of slavery, nor rebellion, nor interference with economic laws can ever overturn. I think this will be a region of coke-made iron on a scale grander than has ever been witnessed on the habitable globe."

I have sought on this occasion to call the attention of the members of the Institute of Mining Engineers to some of the more remarkable points in the geology of the coal region of Central Alabama, especially as compared with that of the more northern portions of the same great coal-basin, and to show the intimate and peculiar relations both of the geology and the geography of the region to its economic interests. I have also wished to record the strong impressions made upon me by what I saw there during a late visit of a week. The development in Central Alabama, not only of a great coal trade, but of a vast iron industry, is certain in the near future, and indeed has already begun. I leave for another time and place the discussion of details respecting the region. Meanwhile, it must be said that the geographical position of Alabama, its mineral wealth, its fertile soil, and its favorable climate are destined to give it a pre-eminent place among the Southern States of our Union.

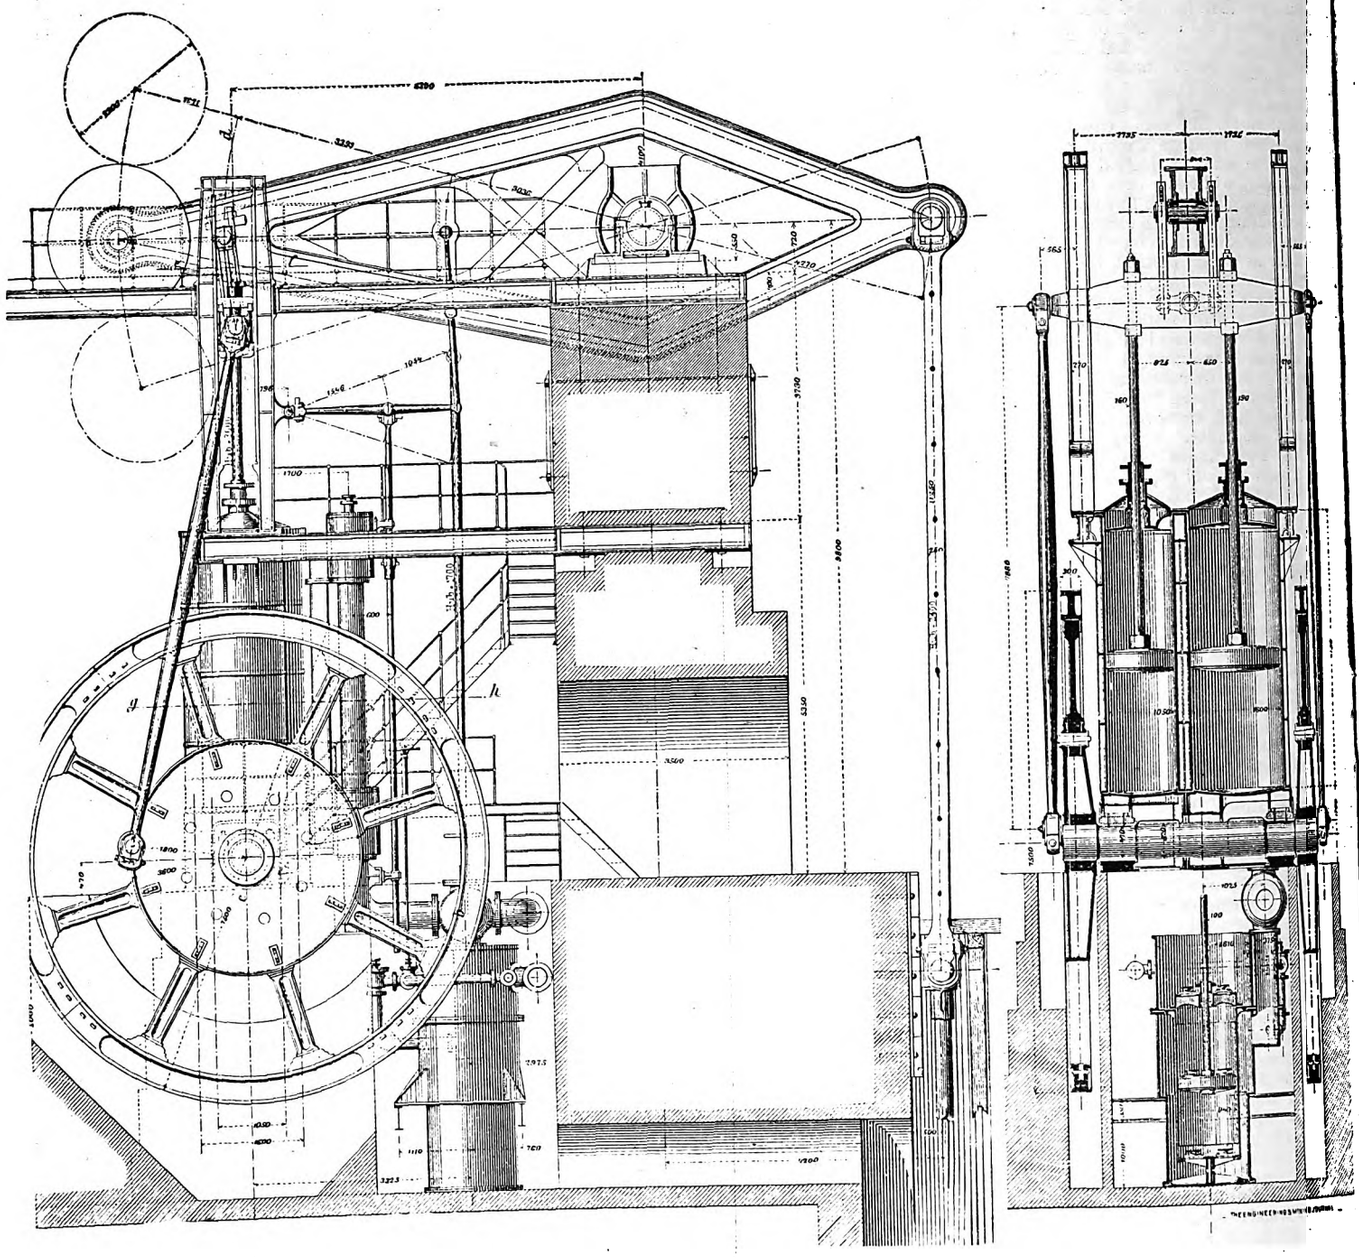
NEW PUBLICATIONS.

United States Mineral Lands; *Laws Governing their Occupancy and Disposal; Decisions of Federal and State Courts in Cases Arising thereunder; and Regulations and Rulings of the Land Department in Connection therewith, with Miscellaneous Matter. By* Henry N. Copp. Second Edition. 1882. Published by the Author, Washington, D. C. Octavo, 649 pages. (*Index.*)

The disaster by which the larger part of the first edition of this book was burned up has been converted into a blessing by the enterprising author, who has availed himself of the opportunity to bring the second edition down to date, introducing into it decisions and other matter obtained since the publication of the first. In its present form, the work is admirably complete and convenient, and constitutes the best manual for study or reference with which we are acquainted. The mining part of Dr. Raymond's *Glossary of Mining and Metallurgical Terms*, published in the first edition, is retained in this.

The Storage of Electricity. *By* Henry Greer. New York: N. Y. Agent College of Electrical Engineering. 8vo, 40 pages.



Among the latest developments calculated largely to extend the application of electricity to the arts, none has attracted as much attention and none is as little understood as the "storage" of electricity. The little pamphlet before us, containing as it does popular illustrated accounts of the many various rival systems now struggling for recognition, will, therefore, be welcomed as a timely contribution to the literature on the subject. Mr. Greer appears to have followed progress closely. He devotes special attention to the Brush system of secondary batteries, the latest form of which has ribbed or corrugated plates. We understand that the Brush Electric Light Company is erecting very large works to manufacture the new storage battery.

The Materials of Engineering. *In Three Parts. Part I. Non-Metallic Materials: Stone; Timber; Fuels; Lubricants; etc. By* Robert H. Thurston, *A.M., C.E.* New York: John Wiley & Sons. 1883. 8vo, 364 pages, 77 Illustrations. (*Index.*)

Professor Thurston, of the Stevens Institute of Technology, is so widely known as an authority on the strength and quality of materials that any thing coming from his pen is sure to attract attention and appreciation. In the first volume of his work, recently issued, he treats of subjects which he has perhaps, with the exception of lubricants, dealt with less as an original investigator than he has with alloys, metals, iron, and steel. For this reason, possibly, the later volumes will be looked forward to with more expectation. The plan, so far as Part I. reveals it, is simple, and will commend itself alike to those mechanical engineers who take up the topics treated for the first time and to those who propose to use it as a book of reference.

Professor Thurston deals with the materials of engineering one by one, beginning with stones and cements. He sketches their origin, the localities where found, and then goes into a more elaborate discussion of their power of resisting strains and decay. His chapters on timber are, as they naturally should be, very elaborate and thorough. There are numerous well-executed illustrations of American forest-trees, a thorough chapter on the strength of timber, on jointing, the holding power of screws and nails, varnishes and oils, and timber-preserving processes. Fuels are treated in a manner commensurate with the importance of the subject to the mechanical engineer, who, if he desires it, can refer to more elaborate special text-books on the subject. The fifth chapter is that on lubricants, and in it we find frequently the evidences of Professor Thurston's thorough researches on the subject. An appendix contains a handy series of conversion tables.

THE KLEY PUMPING ENGINE.

In Belgium and Germany, the Kley engine for pumping has been gaining favor very rapidly during the last decade for handling the water in coal and metalliferous mines. It is prized particularly because it admits of wide variations in speed to accommodate differences in the flow of water into the mine without affecting the economy of the engines. The Cornish engines, which held sway for so many years for pumping, have the disadvantage that they can not work with expansion, and besides they are liable to breaks, entailing very serious costs for repairs. Ordinary fly-wheel engines will not work at a speed less than four revolutions per minute, so that often, when the flow of water is temporarily small, an extra engine must be provided to handle it, the supply not being great enough to keep the larger engine at work steadily. Herr Kley, of Bonn, Germany, has endeavored to unite the advantages of both types of engines, while avoiding their defects; and from the accounts printed during the last four years in the technical journals of the continent and from records of work submitted, he seems to have succeeded very well. The Kley engine is a beam fly-wheel engine with cataract. It is capable, like the cataract engines, of working with pauses between the strokes; and when a greater speed is required, the cataract is thrown out of gear, though even this has not proved necessary in practice. The fly-wheel is a light one, its function being to regulate the course of the piston, and the mass is so chosen that the momentum stored in it during the beginning of the stroke suffices only to the end, so that the engine comes to a full stop after the crank has passed the dead-center until the cataract mechanism has again caused the admission of steam to the cylinder. These pauses or stops may of course be made as long or as short as necessary, the minimum of strokes depending only upon the maintenance of a vacuum and the heat of the cylinder. It does not make any difference whether the crank comes to a stop before or after the dead-center, the fly-wheel simply moving in the opposite direction. The masses rotating are much smaller than ordinary fly-wheel engines, and those built according to the Kley system are claimed to be more substantial and safer. In the case of a breaking of the pump-rod or the draining of the sump, the cataract does not open the steam-valve, so that breaks are impossible.

As a recent example of the Kley system, we illustrate in the accompanying cuts a compound pumping-engine built for the Rheinpreussen colliery by the Gutehoffnungshuette at Oberhausen, and described by Herr Th. Lempe in the *Zeitschrift des Vereins Deutscher Ingenieure*. As will be seen, the engine has a 1050 millimeter (41·33 inches) high-pressure and a 1600 millimeter (62·99 inches) low-pressure steam-jacketed cylinder placed side by side with a 3600 millimeter (141·73 inches) stroke. The stroke of the pump-rods is 2400 millimeters (94·49 inches), the length of the walking-beam from the center of the pump-rod bearings to the center of the counterweight being 12·73 meters (41·77 feet). The diameter of the two fly-wheels is 7·5 meters (24·61 feet) and the weight of the rim of each 13 tons, the total weight of the engine, exclusive of counterweights, being 243 tons. Steam enters the cylinders through the valves e and e', v and v' being the valves connecting the high and low pressure cylinders, and a and a' being the exhaust-valves. They are actuated by the shafts w and w', the former for the inlet and the latter for the exhaust-valves. The tappets k, attached to s, by means of the

Digitized by Google

levers *h* bring the shafts *w* and *w'* into their normal position, when all the valves are closed. When moved in one direction, the lower, and when moved in the other, the upper, valves are opened. The movement downward is brought about by the cataract *c*, while the upward movement is effected by the tappets *k'*. Then springs compressed in the box *f*, compressed by the closing movement effected by the tappets *k*, rapidly bring the shafts in the position corresponding to a full opening of the valves. By an adjustment of the cataract and the different tappets *k* and *k'* it is easy to bring the engine to rest after one revolution of the fly-wheel at a point in advance of or beyond the dead-center. In the former case, the crank-shaft will simply oscillate; in the latter, it will revolve with pauses near the dead-center; these stoppages, however, becoming less in amount when the engine is running fast.

The engine illustrated was built for a maximum duty when running at a speed of 10 revolutions per minute of forcing 2·8 cubic meters (740 gallons) of water per minute from a depth of 800 meters (2625 feet) corresponding to 500 horse-power. Upward of 25 engines of the Kley type have been built during the past few years, ranging from 30 to 560 horse-power and working at a speed varying from one revolution every two minutes to 18 revolutions per minute, some being direct-acting, the majority, however, being compound beam engines, cutting off at one-quarter to one eighth of the stroke, the greater number being condensing.

THE SODA INDUSTRY ABROAD.

Before the young but vigorous Society of Chemical Industry recently formed in Great Britain, Mr. Walter Weldon, whose name is so closely identified with progress in that branch during the last decades, read a paper on the present condition and the prospects of the soda industry abroad. His statements, it will be noticed, are full of interest to American miners and chemical manufacturers. The manufacturers of soda by the Leblanc process have fallen upon evil times. For some time past, their profits have been steadily declining, until now they have disappeared and have been replaced in many cases by actual loss. Of twenty-five alkali works which were in operation in the neighborhood of Newcastle-on-Tyne a very few years ago, twelve have been closed, and of these no fewer than eight actually dismantled in despair of it ever again being possible to manufacture soda in them by the Leblanc process, except at a loss. The alkali-making districts of Lancashire have advantages over the Newcastle District in respect of the price of salt, of facilities for supplying the American market, and of nearness to some of the centers of soda consumption; but even in Lancashire seven or eight of the alkali-works are standing idle, and but few of the others are working to their full capacity. In Belgium, the production of Leblanc soda has died out, while in France, Germany, and Austria it is only maintained by the aid of import duties and the large demand for the by-product, hydrochloric acid.

This deplorable condition of the trade is mainly due to the great increase of the output of soda manufactured by the ammonia process, an increase which, though rapid in the past, bids fair to proceed by leaps and bounds in the immediate future. Whether the new process will entirely supersede the old one is a momentous question to those that have invested their money in the latter, and a question not easily answered. Mr. Weldon has set forth the facts which lead him to hope that, although the Leblanc manufacturers have probably not seen the worst, yet that a time may come when they may be able to hold their own against the manufacturers by the ammonia method. At present, he estimates the total annual soda production of the world expressed in terms of pure Na_2CO_3 at 708,725 tons, of which 432,000 tons are manufactured in Great Britain. Twelve per cent of British soda, and 23 per cent of the total soda of the world, are produced by the ammonia method, which was first put into commercial operation in 1866 by Mr. Ernest Solvay, of Brussels. There are now eighteen ammonia soda-works at work in Europe and one in the United States, and seven more are approaching completion.

But serious as this competition is, there is another about to commence that will further tend to aggravate the congestion of the trade, and this is the manufacture of soda combined with the extraction of copper from Spanish pyrites. As is well known, the sulphuric acid used in the Leblanc process is invariably manufactured from the sulphur of pyrites, and the pyrites used in this country is now almost exclusively obtained from Spain or Portugal, and contains from two to three per cent of copper, besides small quantities of silver and gold. After the sulphur has been burnt off, the metals are extracted by the wet process, and what remains is an almost pure oxide of iron that finds a ready sale at fairly remunerative prices. The supply of pyrites is in the hands of three large companies, one of which also sends large quantities to Germany, but up to the present neither has been able to sell any in France. This results from the fact that there are two large deposits of non-cupreous pyrites in France, one in the North and one in the South, both belonging to soda makers, who supply the other manufacturers under contracts of fifteen years' duration, which have yet a considerable time to run. The residual burnt ore, or pyrites cinders, in France has little value, as it is contaminated with sulphur and phosphorus which can not be profitably removed, as there is no copper to be gained at the same time. English cinder contains more sulphur, but this is removed in the extraction of the copper, and the product is pure purple ore that would be of considerable value in France, where the import duty upon cast-iron is greater than the present price of Glasgow pig. To find a market in France for these Spanish ores, the Rio Tinto Company has promoted a subsidiary company, La Compagnie d'Exploitation des Minérals de Rio Tinto, which is to make Leblanc soda in France and elsewhere from Rio Tinto pyrites, relying for its profits neither on soda nor on chlorine, but on copper and oxide of iron. For this company soda and chlorine will be by-products, which it will be glad to sell at a profit if that may be, but which, if not, it will be content to sell for the bare cost of manufacture, thus combining what are now two separate businesses in England, one of which is not without profit, even when pursued without the protection of import duties. It has a works already commenced at Marseilles, and there is a rumor of five others in France; in addition to these, it proposes to erect works at Antwerp and in the United States.

When the ammonia process was introduced, the Leblanc manufacturers anticipated that the demand for ammonia would raise its price very considerably, and thus increase the expense of the process. But the expectation has not been realized, and the price of ammonia is now falling before the increased sources of supply. This is brought about by the Carvé and the Jameson system of extracting ammonia from the gaseous products of coke-ovens, and now tar and ammonia are regularly collected from two of the sixteen blast-furnaces at the Gartsherrie Iron-Works, Scotland. The quantity of ammonia at present obtained corresponds to about 18 cwt. of ammonium sulphate per day, being at the rate of 20 pounds of ammonium sulphate per ton of coal consumed. There are 120 blast-furnaces in Scotland, each consuming, on an average, 50 tons of coal per twenty-four hours. The total amount of coal burnt in them per annum is therefore 2,190,000 tons, which would produce, were it collected, an amount of ammonia equivalent to 20,000 tons of ammonium sulphate, worth at present prices £400,000.

Now, as there seems no likelihood of the ammonia process languishing for want of material, the only hope of the Leblanc manufacturers would seem to lie in cheapening their own process until they can contend with their rivals upon equal terms. Already much has been done, and a large saving effected by means of rigid economy; but this only touches the fringe of the cost; and if the difference of 20s. a ton or thereabouts, that divides the two processes, is to be bridged over, it must be by something more radical than economy in details. The consideration of the direction in which relief is to be sought, and the means to be adopted in accomplishing it, was the primary object of Mr. Weldon's paper. After throwing out a hint that a new field for the utilization of hydrochloric acid, other than the manufacture of chlorine, will shortly appear, the first alleviation that Mr. Weldon insists upon is cheaper pyrites. The present price of 6d. per unit is due to a combination between the vendors, which will expire at the end of next year, when a reduction of 50 per cent may be expected. As to make a ton of actual sodium carbonate by the Leblanc process does not require more than about 13·5 cwt. of pyrites, this reduction in price would only amount to about 7s. 9d. per ton, a little more than a third of the twenty shillings necessary to effect a commercial equilibrium between the processes. But there are still two more resources to make up the balance of the 20s. The first is sulphur recovery, that is, as free sulphur. There has lately arisen a hope that the whole of the sulphur of the calcium sulphide contained in the waste may be recovered in a free state. The actual cost of Sicilian sulphur delivered at Marseilles in bulk is £5 per ton; therefore, to become masters of the sulphur market, and at the same time to gain by the recovered sulphur sufficient to cover their loss, English soda-makers must be able to effect the recovery at a cost not exceeding £2 per ton. They will hardly be able to do this at first, but eventually they may, and then, if the chlorine products should again command a reasonable price, the Leblanc process will be able to hold its own.

The suggestion of the third course comes from Newcastle, and is of much importance to almost every other industry, besides soda-making. It is, that the manufacturer should entirely cease to use raw coal as fuel, but should convert it all into coke, collecting for sale the oil and ammonia evolved during the conversion, and himself using for heating purposes the gases distilled during the coking operation. It is believed that, in the Newcastle District, at any rate, by this mode of proceeding the soda-maker would obtain his fuel virtually for nothing. In that district, there are produced per annum some two millions of tons of very small coal or "duff," which is almost a waste product, and which, singularly enough, yields more oil than the more costly kinds of Newcastle coal, while at the same time yielding a very fair coke, sufficiently good, at any rate, for use in the furnaces of chemical works, especially when its combustion is assisted by that of the gases from the ovens in which the coke is produced; and the value of the oil and ammonia obtained when this "duff" is coked in ovens to which the Jameson system is applied is greater than the cost of the "duff," *plus* the cost of coking it. And it is probable that improved condensing arrangements will render the yield, if not of oil, at any rate of ammonia, so much greater than the yield hitherto actually realized as to enable the same result to be obtained in the case of ordinary steam coal, not only in the Newcastle District, but in the Lancashire District also. If so, the cost of producing Leblanc soda in both districts will be diminished by almost the total amount of the present cost of Leblanc soda for fuel. Mr. Weldon says "almost," because, so far as one can see, the use of raw coal for "mixing" in the black-ash process must still be continued. He believes that this idea can not but be as applicable to almost all other industries as to the soda industry; while the result to the material well-being of mankind of its general application it is utterly beyond the power of any imagination adequately to conceive. This idea means, among other things, cheaper fuel for all purposes, an enormously increased supply of agricultural produce, and the entire suppression of smoke even in the busiest centers of industry. He thinks that the same idea might be applied even to the fuel required for domestic purposes, rendering cities absolutely free from smoke. He holds that the time will come when gas-works will be replaced, at least to a large extent, by establishments in which coal will be treated for the production of coke, illuminating oils, ammonia, and heating gases: the coke to be burnt in domestic fire-places, the oils to be used for lighting the interiors of houses, the ammonia to be employed in agriculture, to cheapen and render more abundant supplies of food, and the gases to be burnt for raising steam for driving dynamos for lighting streets by the electric arc.

AN IMPROVEMENT IN COPPER SMELTING.

Written for the Engineering and Mining Journal by Paul Johnson, Mining Engineer and Metallurgist, Worcester, Mass.

I propose the following modified copper smelting for large works where different ores are to be dealt with, consisting principally of sulphureted copper ores containing iron.

Four fifths of all copper produced in the world is made from sulphureted copper ores containing a considerable quantity of iron combined with sulphur. The general principle followed for making marketable copper in the dry way (for which either only reverberatory furnaces, or a combination of reverberatory and shaft-furnaces are employed) is, first, to carry all the earthy matters into the slag and concentrate the copper in a matte, by mixing roasted or oxidized ores with raw ores, and smelting down. The aim is to obtain a matte containing generally from 30 to 40 per cent copper, about 26 per cent sulphur, and the rest principally iron.

The next step is to get rid of most of the iron and part of the sulphur, in order to obtain a product approaching Cu_2S. This is done by one or more fusions of the first calcined matte, generally mixed with rich oxidized ores or rich slags from succeeding processes. This fusion is generally carried out in a reverberatory furnace. The number of concentrations depends on the purity of the ores, or whether they contain gold or silver, which is to be extracted. If the ores are pure and hold no gold or silver, the matte first obtained is calcined to such a point, and the addition of rich ores made in such a way, that, by the first fusion, white or pimpled metal is obtained.

This product is now exposed to an oxidizing smelting, called roasting, in a reverberatory furnace, to get rid of the sulphur and the greatest part of the other remaining impurities. Cu_2S is oxidized to CuO which, acting on Cu_2S, reduces Cu, which, in consequence of its higher specific gravity, goes to the bottom and there collects. The process is carried on until all the copper is reduced and the absorbed sulphuric acid has worked off, when the product is tapped as blister copper.

This blister copper is now refined by scorifying through oxidation the remaining impurities, skimming them away with the slag, and reducing by poling the cupreous oxide dissolved in the copper, thus obtaining copper in a tough state.

Digitized by Google

I propose to substitute for this method another requiring less time and cost. The principle is based on the known fact that, when copper matte in a sufficiently heated molten state is exposed to the action of strong blast, the iron and sulphur are oxidized, generating heat before it acts on the copper. I will give a general sketch of the process, afterward dealing with the details.

By running down the ores in a shaft-furnace, I get rid of the gangue, and have the copper concentrated in a matte holding about 35 per cent copper. This matte, mixed with rich oxidized ores and refinery slags, is smelted down with an oxidizing flame in a Siemens furnace; the heated molten mass is exposed to the action of hot blast, through inclined tuyeres, thus oxidizing the iron and sulphur. When a proper quantity of iron is scorified, the blast is shut off and the slag skimmed. This done, the blast is put on, and this is repeated until the iron and sulphur are oxidized, and the product obtained is blister copper. This is refined in the usual way, preferably in large charges in a Siemens refining furnace.

As for the concentration of the copper in a matte containing about 35 per cent copper, this may be done cheapest, quickest, and best in a shaft-furnace of large capacity, say from 100 to 150 tons per twenty-four hours, either in a Raschette or, still better, in a round Pilz-Mansfeld furnace with from 6 to 8 tuyeres, and wider at the top than at the bottom, thus allowing greater hight to the furnace, and consequently economizing fuel, but at the same time preventing the reducing effect of the furnace from increasing to disadvantage. By making up the charge in a proper way and careful feeding, these furnaces give far better results than others. Experience has proved that the least copper is lost in the slag when a matte is obtained from the charge containing about 35 per cent copper and 26 per cent sulphur, and the slag is rich in iron between bisilicate and monosilicate. The loss of copper in this smelting is caused only by shots of matte suspended in the slag. It is, therefore, desirable to get a slag, which, at a temperature not too high, is sufficiently liquid, and the specific gravity of which at the same time is low, allowing the shots of metal to pass easily through.

This matte is now to be treated in a Siemens furnace, which ought to have a sufficient length of hearth in order to utilize the flame, and a deep and a strong bed, in order longer to resist the corroding action of the oxidized iron, and to be able to hold a charge of at least 10 tons of matte. Below the fire-bridge, and between the hearth and regenerators, there ought to be an air-space, in order to cool off the sides of the hearth. The roof should consist of two arches, the lower of fire-brick, the upper of common brick, in order to let the blast pass through the space between them and be heated at the same time that the lower vault is cooled off, in order better to resist the heat of the flame. In the middle of each of the sides of the furnace, and opposite each other, are two working and charging doors. Through one of these, the furnace-man pulls out the slag, the helper at the same time pushing it toward him with the rabble through the other, thus allowing the slag to be skimmed off quickly, completely, and in a practical way. On each of the sides of the furnace, are four or five tuyere-holes, so arranged that, if tuyeres are put in and the blast let on, this will strike the surface of the molten metal at an angle of from 35 to 40 degrees at a distance of from 1½ to 2 feet from the side. These tuyere-holes are arranged at the same distance from each other between the ends of the hearth, directed at right angles to the length of the furnace. The tuyeres ought to allow a strong concentrated jet of air to strike the surface, and should be arranged so as to be capable of being pulled out when the blast is shut off, in order that the tuyere-holes may be closed up, thus preventing cold air from entering and cooling off the furnace. The matte from the cupola-furnace is mixed with rich oxidized ores and refinery slags, and a charge of about 10 tons put in the furnace. The charge is smelted down with an oxidizing flame, the slag is stirred with the rabble, and some siliceous flux is put in if necessary. The charge may always be made up beforehand in such a way that this is not necessary at the first skimming. The tuyere-holes are now closed up with clay or in any other way, and a good heat given for a quarter of an hour or twenty minutes, in order to get the slag fully liquid, so that a good separation of the shots of metal from the slag may take place, and that the sulphide of iron may surrender its sulphur to the cupreous oxide and take the place of the latter as FeO, if cupreous oxide should occur in the slag. The slag being liquid enough, is skimmed off; some siliceous flux is put in, in order to saturate the oxidized iron formed during the following oxidizing process; the heat is raised, and when it is high enough, the blast is put on. By the inclination of the tuyeres, strong pressure on the hot blast, and its concentration in smaller jets, the heat generated by the oxidation of the iron and sulphur ought to increase and maintain the temperature in the furnace so far that, when the reaction has fully commenced, the gas may be entirely or considerably decreased. The jets of blast will of course stir up very vigorously the molten bath of metal, causing new particles to be exposed to the action of the air, and also causing a very rapid oxidation, mixing the oxidized partioles with the sulphureted ones, forming sulphurous acid, which passes away, and oxidized iron, which rises to the surface. When enough slag has accumulated, the blast is shut off, the tuyere-holes closed up, siliceous fluxes are put in, the slag stirred, and heat given as before, to separate slag and metal, and to have FeS to convert Cu_2O to Cu_2S. In order to obtain a more complete separation and reaction, longer time is now required than at first. The slag is again skimmed off, and the process kept up in this way until most of the iron is scorified. At this stage of the process, the product consists chiefly of sulphide of copper; the blast now oxidizes both the sulphur and copper, forming cupreous oxide, which reduces the metallic copper from sulphide of copper. The metallic copper sinks to the bottom and there collects. When most of the sulphur is oxidized, the blast is shut off and the cupreous oxide dissolved allowed to reduce the remaining sulphide of copper. The sulphurous acid having worked off, the heat is raised, the thin slag skimmed off, and the product tapped as blister or set copper. The furnace-man requires, of course, some practice to know the right moment when to shut off the blast, in order to get blister copper. If the blast is kept on a little longer than necessary, more copper will pass into the slag; but the product obtained will, in consequence of its containing more dissolved cupreous oxide, be so much easier to refine. The slag from the first skimmings will contain less copper than the later ones, and by putting in proper fluxing substances, they may be poor enough to throw away. The later ones may be run down in the cupola-furnace, together with the ores. When the charge has been tapped out, the bed is carefully mended with silica, and the furnace is ready for the next charge. It would, perhaps, be an improvement to tap the product, when in a state of strong pimple metal, in a heated converter, and Bessemerize it. The making of blister or set copper from pimple metal would then only require from ten to fifteen minutes, and the disadvantage of the Bessemerizing of poorer metal in a converter, on account of the strong corroding action of the iron on the lining, would now be got rid of. The sulphur would pass away as sulphurous acid, and the blowing might be kept up so far as to obtain a somewhat dry copper. The slag very rich in copper would be put into the Siemens furnace.

The Siemens furnace ought, of course, to have great advantage over the common English reverberatory furnace. With a Siemens furnace and hot blast, the two conditions that are essential to the success and rapid execution of the process, namely, a strong heat and a strong oxidizing blast, may be completely controlled; when the heat generated by the oxidation of the iron and sulphur is sufficient to carry on the process, the gas may be shut off, thus saving fuel. In France, copper matte is treated in a converter with success; but starting on a matte with only from 20 to 30 per cent copper, the great quantity of iron that is to be scorified, and which must take the necessary silica from the lining, must be taken into consideration. I think the reverberatory furnace, with blast through inclined tuyeres, is the most natural and practical furnace to treat a product of such quality. The slag formed may easily be skimmed off, and fluxing substances put in when necessary, giving a clean slag, and at the same time preventing a too strong corroding action of the iron on the lining. The metal being concentrated to strong pimple metal, when scarcely any thing but sulphur is to be removed in order to get copper, the converter ought to be the most natural furnace for this process. The question is only whether the time and quality of copper gained by Bessemerizing would pay the increased cost of the converter and its management. The converter could be used many times before mending its lining, and could probably have the same blowing-engine as the Siemens furnace. By this way of treating matte, especially by using a converter for treating the product when brought to pimple metal, a charge of ten tons, holding 40 per cent copper, may easily be brought up to blister copper in from ten to twelve hours.

This blister copper may now be refined in the usual way: but I think a Siemens furnace is even here to be preferred, provided that, by washing or in any other way, the gas produced is made sufficiently free from impure matter. If these experiments are executed by a person who understands this matter not only theoretically, but has had to do himself practically with copper smelting, I am sure they will prove successful.

In order to compare the advantage of this proposed process over that now generally in use, we may see what is required for making a certain quantity of copper in either way, supposing we start from matte containing about 35 per cent copper, and which, by the admixture of rich oxidized ores, is made up to contain 40 per cent copper.

If a charge of a little more than ten tons is treated in the Siemens furnace, this may in twelve hours turn out four tons of blister copper. Supposing one furnace-man and two helpers are required for the furnace, this will require in addition one man for the gas-producer and one engineer for the blowing-engine. That is, for making eight tons of blister copper in twenty-four hours, one Siemens furnace and ten men are required.

Let us now see what is required for the same work in the usual way now in use. At one of the larger copper-works of this kind in the United States, they use, in order to calcine the crushed matte, four calciners, each treating 2½ tons in twenty-four hours, calcining away from a matte of about 25 per cent sulphur from 10 to 15 per cent, requiring per shift three men. There are required besides three men for the crusher, and one engineer, that is, fourteen men in twenty-four hours. In order to do the double work in twenty-four hours, there may thus be required eight calciners and at least twenty-four men, if one larger crusher has to do all the work of crushing. If this calcined matte, by fusion in a reverberatory furnace in charges of five tons each in twelve hours, turns out strong white metal, I think the result is considered good. In order to make twenty tons calcined matte up to strong white metal in twenty-four hours, are thus required two reverberatory furnaces and eight men. From ten to twelve tons white metal thus obtained are now to be made up to eight tons of blister copper by roasting in twenty-four hours. This may be done by two reverberatory furnaces in twenty-four hours, each treating from five to six tons white metal and requiring eight men. Supposing the cost of keeping the blower for the Siemens furnace to be equal to the cost of the crusher for the calciners, the question is reduced to this point: Is it cheaper to bring twenty tons of matte to blister copper in one furnace in twenty-four hours, with fuel and repairs required for one furnace, and ten men, than to do the same work in eight calciners, four reverberatory furnaces, with fuel and repairs to all these, and forty men? I claim, too, that the blister copper from the Siemens furnace, on account of the increased heat and strong oxidizing blast, may not contain more—on the contrary less—impurities than the copper from the other process, though by this process it has required only one sixth of that time.

The Corrosion of Iron and Steel.—At a recent meeting of the Paris Academy of Sciences, a paper was read describing some researches by M. Gruner, on the relative corrosion of cast-iron, steel, and soft iron. Various plates, suspended in a frame by their four corners, were immersed simultaneously in water acidulated with 0·5 per cent of sulphuric acid, or sea-water, or were simply exposed in moist air of a terrace foundry. In moist air, chrome steels were corroded most rapidly, and tungsten steel less than carbon steel. Cast-iron, even when high in manganese, is oxidized less than steel and soft iron, and white forge pig less than gray foundry-iron. Sea-water, on the other hand, attacks cast-iron more than steel, and with special energy white iron. Tempered steel is less attacked than the same steel annealed, soft steel less than steel high in manganese or chrome steel, etc. Acidulated water, like sea-water, dissolves gray pig-iron more rapidly than steel, but not white iron; the gray impure pig-iron is most strongly attacked. These results agree with the complete experiments on the subject by Mallet in 1843.

OFFICIAL STATEMENTS AND REPORTS.

QUINCY MINING COMPANY, LAKE SUPERIOR, MICHIGAN.

The directors of the Quincy copper mine, the most productive on the lake, after the Calumet & Hecla, have just issued their report on the business of the mine during the year 1882. The shipment of the season was 6,853,660 pounds of mineral, which has been smelted, and yielded about 82·67 per cent, or 5,665,796 pounds of refined copper. The product of the mine for the year, as prepared for shipment, was 6,874,230 pounds, or $3437\frac{230}{2000}$ tons of mineral, of which 6,508,410 pounds were stamp copper, and 365,820 pounds mass—a total of 6,874,230 pounds; for which, estimating copper on hand in New York at 18 cents per pound, and the product left over at the mine at 82 per cent yield and 15 cents per pound, has been realized the gross sum of $970,363.27, to which must be added $6142.83, realized from sale of silver, making a total of $973,506.10.

The expenses of the year were as follows: Running expenses at mine, $381,010.82; building and construction account, $63,427.63; smelting, transportation, and all other expenses, $96,969.13; making a total of $541,407.58; which, deducted from gross earnings, $973,506.10, leaves as mining profit $432,098.52. There has also been realized during the year, from interest and profit on sale of company's stock, $16,455.33, carrying the total to $448,553.85. The statement of assets and liabilities in the last report showed a balance on hand, as of date January 1st, 1882, $735,313.79, to which add earnings of 1882, $448,553.85, or $1,183,867.64. Deducting the dividend of February 20th, 1882, of $320,000, and the dividend of August 21st, 1882, of $200,000, a total of $520,000, leaves a balance of assets, January 1st, 1883, $663,867.64.

A dividend of $6 per share, or $240,000, payable February 15th, has been declared, which, with the dividend of $5 per share paid August 21st last, makes the total for the year $440,000. The total dividends paid to date aggregate $3,300,000.

The Quincy, at the beginning of the year, was carrying a stock of 880,000 pounds of copper.

The following is a brief summary for the year:

Average force employed	438 men.
" number of miners	152 "
" wages of miners on contract, per month	$48.83
Yield of mineral per fathom of ground broken	970 lbs.
" refined copper per fathom of ground broken	800 "
Total rock mined	120,377 tons.
" " hoisted	109,751 "
" stamp-rock treated	101,327 "
Yield of stamp-rock treated (3·21 per cent)	6,508,410 lbs.
Product mineral	6,874,230 "
" refined copper	5,682,663 "

The report of the agent, Mr. F. G. White, shows that the mine was in a satisfactory position.

IRON SILVER MINING COMPANY, LEADVILLE, COLORADO.

In accordance with a resolution passed at the last annual meeting of this company, making the close of the fiscal year correspond with the close of the calendar year, the Board of Trustees have submitteda report for the five months ended December 31st. The total receipts for that period were $1,047,387.32, while the expenditures were $697,667.52, leaving a profit of $349,719.80. By the payment of $400,000 in dividends, the cash on hand on March 1st, 1882, of $182,605.27, has been reduced to $132,325.07, making the surplus, including timber and supplies on hand, at the beginning of the year $151,153.78. The trustees say: "There have never been any stated times for the payment of dividends. The rule has been to pay dividends of $100,000 whenever there was on hand the sum of $200,000, thus always keeping a reserve of not less than $100,000; and the sentiment of your Board of Trustees is, that this reserve should rather be increased than diminished."

The report in conclusion gives the following data:

Ore produced in ten months, 60,186 dry tons; average moisture, 12 per cent; product of silver, 895,426 ounces; product of lead, 34,360,856 pounds; average number of employés, 500.

Mining work accomplished as per report of surveyor: Stopes, 4012 cubic fathoms; shafts, 305 feet; winzes and rises, 1096 feet; drifts, 11,626 feet.

The mining captains report the mine fully as well opened, and as much ore in sight as at the date of the last report, February 28th, 1882. There is, therefore, every reasonable prospect that the business of the coming year may be comparatively as successful as that of the last year.

PROGRESS IN SCIENCE AND THE ARTS.

Amber in New Jersey.—Mr. G. F. Kunz, in a paper read before the New York Academy of Sciences, describes a mass twenty inches long, six inches wide, and one inch thick, and weighing sixty-four ounces, found at Kirby's marl-pit, on Old Man's Creek, near Harrisonville, Gloucester County, New Jersey, about twelve months ago. A one quarter inch section showed a light grayish-yellow color. A section one and a quarter inch thick showed a light, very transparent yellowish-brown color. The entire mass was filled with botryoidal-shaped cavities filled with glauconite or green sand, and a trace of vivianite. The hardness is the same as the Baltic amber, only slightly tougher and cutting more like horn, and the cut surface showing a curious pearly luster, differing in this respect from any other amber yet examined by Mr. Kunz. This luster is not produced by the impurities, for the clearest parts show it the best. It admitted of a very good polish. The specific gravity of a very pure piece of the carefully selected amber is 1·061, which is the lowest density on record, the usual amber range being from 1·065 to 1·081. It ignites in the same way as other ambers. It was found at a depth of twenty-eight feet, in and under twenty feet of the Cretaceous marl, the amber being found in a six-foot stratum of fossils.

Boracic Lagoons in Italy.—An interesting report upon the springs in the province of Pisa, Italy, which yield boracic acid, has recently been issued by the United States Consul at Leghorn. The district in which the springs occur belongs entirely to one owner, the Count de Lardarel, who in his seven "borax" villages has most conscientiously looked after the welfare, moral and social, of his work-people. Although the whole of the neighborhood contains most extensive borax deposits, it is not from these sources that the most abundant supplies are obtained, but from shallow artesian wells. The boring, however, is carried down until the well yields water, when the machinery is withdrawn and water let into the shallow pond previously dug around the bore-hole. This water becomes heated up to boiling-point and impregnated with the borax, which rushes up from the opening of the artesian well, after which the water is drawn off and evaporated by passing it over a series of shallow metal pans, from 15 to 20 in number, arranged like a cascade. The borax, as it reaches the bottom pan, is half solidified, and when cold has the appearance of being frozen over with a skin of rotten ice. This skin is removed and strewed on the floor of a drying-house, heated by hot pipes, and by this means the borax becomes crystallized. The lagoons have a most peculiar aspect during the issue of the borax. When full of water, the boiling is continuous, rising to some feet in hight, and the vapor is unpleasant from its sulphurous odor. The smell of sulphur, indeed, pervades every thing about the establishment, and every thing in the shape of metal is discolored. The quantity of borax produced from the estate averages from 3 tons to 3½ tons a day; but as this is only one of the borax villages (though the most profitable), the total yield may be put down at 11 tons per diem. Upward of 1800 laborers are employed on the property, of whom 800 are exclusively engaged in the production of the acid.

THE *Chemiker-Zeitung* quotes from a German journal devoted to the sugar industry an advertisement asking for the services of an "academically educated chemist, fully acquainted with the manufacture of sugar, who can undertake in summer the coppersmith's work, or the oversight of the teams of draught-oxen." This is a little worse than an American iron-master who wanted a chemist capable of keeping a watch on his phosphorus and teaching the cornet for laborer's wages.

AT a fancy dress ball, held at Hull, England, recently, a lady somewhat electrified the remainder of the company by appearing with incandescent lamps arranged about her person. To quote a local contemporary: "Small incandescent lamps were artistically introduced into the headdress and other portions of the costume, and the electricity was supplied by a gentleman who was in attendance with a box representing a hand-organ, from which were wires attached to the lamps." According to this extract, it seems a matter of conjecture as to whether the source of the electricity was the gentleman in attendance or the box representing a hand-organ. The fact of the matter is, that the box was a bichromate battery, which, together with the lamps and fittings, had been supplied by Mr. T. Muse, an electrician of Hull.

DIVERS IN A CORNISH MINE.—We are indebted to Mr. R. J. Frecheville, of Truro, for the following account of the first diving operation of the kind carried out in a Cornish mine. The heavy and almost incessant rains during the winter have so increased the water in the Phœnix United Mines, Liskeard, that it has risen above the plunger-pole, which is situated 200 fathoms from the surface. After the plunger had been working some time under water, it failed to work satisfactorily. Soon after, it was discovered that it required to be packed, and the question arose as to how the obstruction was to be removed, there being from 10 to 20 feet of water above the top of the pole. The manager and agents held a consultation, and decided to engage the service of a diver. This course was generally approved in the mines, and was accordingly adopted. At first, one diver and his assistant came to the mines, and prepared themselves to perform a piece of work underground which they had never before seen. They, however, determined to make an attempt in a vigorous manner, knowing that, if their efforts were successful, much credit would be reflected on them, as it was the first time any such work by divers had been done in mining operations. The diver succeeded in packing the pole, and a signal was given to the engine-man to work the engine. It started, and the plunger-pole worked in a very satisfactory manner all night; but in the morning, the shaft-men ascertained that the pole had failed, and wanted to be attended to again. The diver prepared and packed the pole the second time, and continued to attend to it until the work was deemed too laborious for one man to continue to do, and the service of a second diver was called in to perform the same kind of work as the former.

FURNACE, MILL, AND FACTORY.

The Philadelphia Hydraulic Works have just completed a 5500-pound steam-hammer, for Anderson, Du Puy & Co., of Pittsburg, and are building a similar hammer for the Co-operative Iron and Steel Works, of Danville, Pa.

For a long time past, the Russians have drawn their supplies of steel shovels almost exclusively from America. Latterly, the Germans have competed for the trade. Two steel-works at Witten, in Westphalia, have succeeded in producing shovels which, according to the German Consul-General at Moscow, are fully equal to the American make and nearly one third cheaper. The import trade in American shovels has consequently nearly ceased.

It is proposed to increase the capital stock of the Glamorgan Iron Company, of Lynchburg, Va., to $80,000.

At Jonesboro', Ala., the site has been selected for one of the largest iron and coal enterprises in the State, and the plans are prepared already.

A Northern company has purchased the iron bed near Rome, Ga., and another blast-furnace will very soon be erected.

The directors of the suspended Union Iron and Steel Company held a meeting at Chicago on the 28th ult., at which, it is said, that it was resolved to submit a proposition to the stockholders at a meeting to be held on March 12th, to issue $1,400,000 of preferred stock on which to start the mills again.

The Republic Iron Mining Company has released its attachment against Brown, Bonnell & Co., and affairs are advancing so favorably under the direction of Receiver Brown that it is expected that the fires will be relighted, and that a start will be made in all departments on the 4th. Many contracts are received, and a determination is expressed to assist Brown, Bonnell & Co. through their present embarrassment.

The firm of D. W. R. Read & Co., a prominent firm of iron-ore importers, of New York, Philadelphia, Baltimore, and London, has suspended.

The managers of the Smithsonian Institution have undertaken to present in all the leading branches of mechanical and manufacturing industry examples on the one hand of the old, crude, and primitive appliances which exist as relics of a past age, and on the other the most approved specimens of American machines or devices which those arts in their modern state afford. In that branch of industrial science which comprises the utilization of the power of water, the managers of the Institution have selected the James Leffel Double Turbine as a representative modern American water-wheel, embodying the most improved and efficient means for the development of water-power as applied to the propulsion of all kinds of machinery. To this end, they requested the firm of James

Digitized by Google

Leffel & Co. to furnish them a specimen of the Leffel wheel, to be placed in the new National Museum building lately completed, adjoining the original structure of the Institution, where it will form a part of the collection of the best modern machinery which is now forming on the plan above described. The wheel asked for by the Smithsonian Institution has been made at the shops of James Leffel & Co., in Springfield, Ohio, and is now at their office at 110 Liberty street, New York. It is not a "model" merely, but a working wheel of 7⅝ inches diameter, one of the regular sizes made by the firm. It differs in no respect from those of their ordinary make, save in its ornamental finish, upon which special care has naturally been bestowed. The gates and gate-rods are plated with gold, and the other parts of the casing with silver.

The sheriff of Washington County, Pa., will sell, on March 27th, the property known as the Antietam Iron-Works, situated in the Sharpsburg District, owned by Daniel V. Ahl, of Newville, Pennsylvania. The works are sold under an execution issued at the suit of the Hagerstown Bank.

J. M. Downing & Co., proprietors of the tube-works in New Castle, have made a proposition to the citizens of Mercer, Pa., to remove their establishment there, provided they will raise $10,000 and furnish a location. Eight thousand five hundred dollars of the amount has already been raised.

The Lehigh bar and guide mill, connected with the Allentown, Pa., rolling-mill, has started. The mill was shut down three weeks ago to make extensive repairs.

The Youngstown steel-works, after numerous delays caused by the non-arrival of machinery, commenced active operations this week by producing steel, the main object being to test their converters and ascertain if every thing was satisfactory.

The Lambert & Bishop Wire Fence Company, in Joliet, Ill., has had plans prepared for a new mill, and will soon begin on it.

The Red Wing furnace, at Sharon, Pa., will probably soon blow out.

A company has been formed in Pittsburg to work the Adams direct process. They will take the works of the Siemens-Anderson company at Linden.

A new firm has been formed, composed of Andrew Carnegie and Henry Phipps, of the Edgar Thomson Steel-Works; H. W. Hartman, formerly of the Gautier Wire-Works, of Johnstown; J. L. Ellwood, wire fence manufacturer, of New York; Mr. Stiles, of Chicago; and Mr. Sears, of Wisconsin. These gentlemen have purchased about twenty acres of land in Beaver Falls, Pa., where they will erect works on a large scale for the manufacture of nail rods, wire, barbed fence wire, etc. The various articles manufactured by the company will be made from Bessemer ingots obtained from the Edgar Thomson Steel-Works.

Dispatches from St. Louis, which look as though they were "inspired," state that great trouble is experienced at the works of the Vulcan Steel Company in its rail department, in its effort to run it without union men.

The Ashland furnace, at Ashland, Ky., has started up again, having been banked on account of rise of water.

It is said that the Billings & Spencer Company, Hartford, Conn., does the largest drop-forging business in the United States. It runs twenty-five drop-hammers, ten presses, one atmospheric and four tilt-hammers, and manufactures upward of 2000 different aricles for parts of guns, pistols, sewing-machines, special machinery, and machinists' tools, besides manufacturing a large variety of goods in a finished state.

A meeting of the Western Nail Association was held in Pittsburg, on the 20th ult., in conformity with a resolution passed at the last regular session, two weeks ago, which was to the effect that work should be resumed in the mills, and continued for a fortnight only, when it would then be decided whether the state of trade would warrant a further run, or whether another suspension would be necessary. A resolution was passed unanimously providing for a stoppage of all nail mills west of the Alleghany Mountains for a period of two weeks, commencing March 4th. Trade was reported fair and the stocks on hand quite light. The stoppage is considered necessary to prevent accumulation of stocks, and to thereby keep the market in a healthy condition. It not being a regular meeting, no action was taken as to prices, neither was there any action taken on the disposition of Eastern manufacturers to cut prices.

Parties representing the Columbus & Hocking Valley Coal and Iron Company consolidation have been in session for two days at Columbus closing up the business and getting ready for operations. The capital stock of the company is $5,000,000, with an estimated cash basis of over half that amount. The consolidation elected a board of directors, which organized as follows: Samuel Thomas, of New York, President; T. Longstreth and Walter Crafts, of Columbus, and J. R. Buchtel, of Akron, Vice-Presidents; S. Churchill, Treasurer; and H. D. Turney, Secretary. J. S. Farlow, of Boston, is a member of the board of directors.

Mr. Horace Ware has sold his furnace, its machinery, and all the lands connected with the operation of this business, to Charles Cobb, of New York; John F. Dickson, of Marshall, Texas; and the Marshall Car and Foundry Company, for $40,000. It is said the purchasers will very soon remove the car-works, now at Marshall, to the furnace, and greatly enlarge the business.

The Cleveland Furnace Company, a furnace and iron company operating under a lease at Steubenville, failed this week; liabilities, $90,000; assets, from $30,000 to $40,000. Inquiries among ore-dealers and others developed the statement that the company, which is a small concern, failed six weeks ago, but was given an extension of time. Mr. F. A. Bates is president of the company, and Mr. W. P. Murray, Secretary.

A number of English capitalists, among them Sir Titus Salt, Charles Stead, and C. Howson, are expected to visit Tennessee at an early date, to examine the Dayton coal mines and a number of iron deposits, with a view to the investment of large amounts of capital in iron and steel manufacturing.

GENERAL MINING NEWS.

ARIZONA.

The following companies have filed articles of incorporation: Ajo Mining and Development Company. Blue Jacket Mining and Milling Company. Central Illinois Mining and Reduction Company. Columbia Copper Company No. 3. Morning Star Consolidated Mining Company. Morning Star and Crescent Consolidated Silver Mining Company. Randolph Mining Company. Sidney Mill and Mining Company. Sonora Coal and Construction Company. Takoma Copper Company. Yavapai Mining Company.

The purchasers of the Peabody mine, at Russellville, are grading for the erection of two more smelters.

COCHISE COUNTY—TOMBSTONE DISTRICT.

A large body of ore has been struck near the side-line of the Good Enough mine, at a depth of 126 feet, the shaft having passed through limestone nearly the entire distance. The extent of the ore-body is not yet developed. Considerable horn-silver is appearing in the west side.

McMahon won the suit against the Last Chance mine, recovering one half.

The 400 level of Contention shows an ore-body over 40 feet in width.

Forty thousand shares of the Emerald Company's stock have been taken by capitalists. The consideration is a certain amount of development-work to be done in shafts, drifts, and cross-cuts. In sinking the shaft the last 20 feet, the ore doubled in value. Extensive development is to begin at once. The Aunt Sally shaft is down 30 feet, all in ore, and is to be sunk to the depth of 100 feet.

Ore has been struck in the Gilded Age mine, assaying $2000 per ton.

PIMA COUNTY.

A report says that there is great excitement over a remarkable silver discovery twenty miles south of Tucson, in the Santa Rita Mountains. The ore-crossing is 100 feet wide and over a mile long. One claim to the property has just been purchased.

HOWARD MINING COMPANY.—The average of ten assays was $9772.76 in silver. This rich ore-streak was found in the Great Republic mine, the property of the company, in a winze sinking below the 200-foot level at a depth of about 20 feet. This company has a complete mill. It has a battery of ten stamps, and has every thing in shape to increase it to 20 stamps if necessary. It also has eight Frue concentrators and roasters, so that it is prepared to treat any kind of ore that may be found in the mine.

CALIFORNIA.

The following companies have filed articles of incorporation: Buchanan Gold Mining Company. Capital, $2,000,000. Directors: John A. Davis, W. Hamilton, Alexander Warner, F. F. Moulton, A. Martin. Inyo Borax Company. Capital, $50,000. Directors: J. D. Langborne, Jr., Robert E. McGill, John T. O'Brien, Henry Glass, and Charles C. Kinsey. Lucky Hill Mining Company. Capital, $10,0000,00; shares, 100,000. Directors: Alexander McAbee, Max Gruenberg, Charles Shaw, A. K. Greene, John Carlin. Mexican Mill and Mining Company. Capital, $60,000; shares, 1200. Directors: John Cushing, Allen D. Cushing, John W. Phillips, W. L. McCrary, Grant I. Taggart, and W. Dingee. Principal place of business, Oakland. Myrtle Gold Mining Company. Capital, $2,000,000; shares, 100,000. Directors: M. M. Estee, John H. Boalt, Ramon E. Wilson, C. T. Bridge, W. E. Sell. San Miguel & La Trinidad Consolidated Silver Mining Company. Capital, $240,000; shares, 24,000. Operations, Mexico. Directors: M. Rosenbaum, George Johnson, John Rodda, J. Bandmann, and C. Nobmann. Zilka Gold Mining Company. Operations, Colorado. Directors: Orrin Skinner, of Quincy, Ill., Henry H. Lynch, Beverly S. Taylor, Frank G. Newland, and J. J. Corrigan.

SAN BERNARDINO COUNTY—PROVIDENCE MINING DISTRICT.

The railroad has been completed to Providence, reaching an extensive mining country.

The mines which are worked in the district show generally good results.

BONANZA KING.—The mill is turning out 2000 ounces of bullion daily. It is reported that a new strike of extraordinarily rich ore has been made in the extreme north end of the first level of this company's mine.

PLUMAS COUNTY—GREENVILLE DISTRICT.

GENESEE.—It is reported that the mill will start up shortly.

GREEN LEDGE.—A force of men has been put to work. The tunnel has been cleared up and pay-ore is now taken out; the best ore has a copper stain and contains a small amount of sulphurets. The average value of the ore, as worked in an arrastra, has been, thus far, $30 per ton. The bullion is very fine, being worth $19.50 per ounce. The men are at work in a rich pocket in a drift below the tunnel, and about 200 feet from its mouth; when this is got into proper order, a new tunnel will be started on the ledge, where it crops out on the surface, and run in till it strikes the breast of the present workings.

CANADA.

NEW BRUNSWICK.

Quispamsis Mining Company. Capital, $300,000; shares, 60,000. Incorporators: George F. French and F. J. Lewis of Boston; Thomas Elston and F. J. Baldwin of Somerville, Mass.; and Alfred A. and Robert O. Stockton, of St. John, N. B.

The St. John *Telegraph* says that some years ago silver was discovered on the James F. Wanamake farm, Hammond River, King's County. The deposit is about three miles from the St. Martins and Upham Railroad. A lease of the land has been secured by Messrs. James Robertson and Robert Shearman, of Albert mines, and D. N. Webster, of Salisbury, and they will form a company to work the mine. Analyses have been made by Professor Burwash, of Sackville, and Mr. Best, of St. John. Professor Burwash's analysis shows: Lead, 26 per cent; silver, 22 ounces troy to ton of lead; gold, 10 pwt. to ton.

NOVA SCOTIA.

According to the Halifax *Herald*, valuable manganese mines have been discovered at Tenny Cape, Cheverie, Walton, and Truro, giving ores of the best quality. At Tenny Cape and Cheverie, the mines have been worked by the proprietors for some years. At Walton, most valuable deposits have been discovered, the ore being of the highest grades. A company is now forming to work this mine, under the name of the Eureka Manganese Mining Company, which will commence operations immediately. At Truro, the St. James Manganese Company is in operation, and the outlook for the return from its mine is also very promising.

COXHEATH MINING COMPANY.—A report from Halifax says that the company has taken out a silver license at the Mines Department there, covering its entire copper areas in Cape Breton, owing to the ore showing a larger percentage of the richer metal as greater depth was attained. It is said these recent developments add considerably to the value of the property and are arousing some excitement among mining speculators.

PROVINCE OF QUEBEC.

The following analysis of apatite taken from the township of Templeton, Ottawa County, has been furnished us by Messrs. Benedict & Cole, of this city:

Phosphoric acid*	40·812
Fluorine†	3·554
Chlorine‡	0·040
Carbonic acid§	0·518
Lime	49·102
Calcium	3·763
Magnesia	0·620
Alumina	0·565
Sesquioxide of iron	0·125
Alkalies	?
Insoluble residue	0·630
	99·729

COLORADO.

The following companies have filed articles of incorporation:

Alcove Consolidation Mining Company. Capital, $500,000; shares, 50,000. Operations, Colorado. Directors: Q. J. Wellington, J. J. Pochon, and Sparoc Wellington. Principal office, Colorado Springs; branch offices in New York and Chicago. Belleville Mining, Smelting and Prospecting Company. Capital, $200,000. Operations, Colorado. Principal office, Belleville, Ill. Bowman Mining Company. Capital, $100,000. Operations, Colorado. Directors: J. B. Bowman, A. D. Breed, and H. B. Gillespie. Principal office, Stamford, Conn. Principal office, Black Hawk.

CLEAR CREEK COUNTY.

GOOD LUCK.—The tunnel is driving into the mountain; it is now in 1250 feet. At this point they are raising a winze to connect with a drift which is extending from the bottom of the main shaft, which is now 560 feet in depth. When this connection is made, it will drain the mine and give it good ventilation and save largely in expense.

LITTLE MATTIE.—The Argo mine has disposed of one half of its property to this company for $10,000. Machinery will be erected immediately, and the property will be developed extensively.

POLAR STAR LODE.—The work of clearing out the mine is nearly completed.

SNOWDRIFT.—The lower level east shows three feet of quartz, interspersed throughout with rich sulphurets. The formation is appearing in the level above, which seems to indicate a body of ore coming up from below eastwardly. The proposed seventy-foot shaft at the cross-cut from the lower level is down four feet.

WALLACE.—The company will build a concentrator either at the mouth or the head of Ute Creek, in the near future. The company has also purchased the Cecil lode. The Wallace and Cecil lodes are the extension of the Freeland mine on the west, and both properties will be extensively developed.

GUNNISON COUNTY.

ISLET.—The mill was shut down after running the Goldsmith ore, and will not be started again until some radical changes and additions have been made. Among these is contemplated an increase of the capacity to twenty or forty tons; the substitution of a 75 horse-power boiler and engine for the present ones, which have proved inadequate to drive even the present machinery; the procuring of new screens, and also additional pan room for the present furnace, which is capable of treating ten tons of ore per day, while the pans are insufficient for more than four.

LAKE COUNTY.

Late Leadville exchanges contain the following:

The great flow of water in the deeper shafts on the north side of Fryer Hill, seriously interfering with the work in the deeper shafts for the past two years, is reported to have greatly abated, and in some instances nearly ceased. In consequence, quite a number of the shafts have resumed work.

AMIE.—This property is producing a great deal of ore, of all possible grades and varieties, at present. The property has a number of lessees working upon it, most prominent of whom are those who secured the No. 3 shaft and contiguous territory. The mine from this shaft is producing about 125 tons daily, ranging from ten to forty dollars per ton. About 140 men are at present on the pay-rolls of the lessees, and worked in eight and ten-hour shifts.

BIG PITTSBURG.—The company has stopped all its leases except the one upon the Haytrosser shaft. Manager Bulkley began on work for the company the Lent shaft during the week, but, owing to trouble with the machinery, a temporary suspension was found necessary. Work will be resumed.

CHRYSOLITE.—The company is still engaged in pushing work on the incline from the Colorado Chief No. 2 shaft, and a small streak of pay-ore has been disclosed in the second or lower body of iron, but no pay. Recent developments confirm the statement that there are two distinct bodies of iron in this portion of Fryer Hill, being separated by eighty to ninety feet of rock. A new strike, of doubtful importance, has been made in the past week in the Colorado Chief shaft, worked on a lease of Mr. J. C. Langhorne and others.

COLONEL SELLERS.—The mine, situated on the south side of Iron Hill, has resumed the sinking of the shaft. The new pumps are handling the water with ease, and no further trouble in this direction is anticipated. The shaft is still in ore of low grade.

HENRIETT.—The continuation of the Henriett incline recently encountered another large water-course, and the flow of water since then has seriously retarded work in this particular portion of the mine. Manager Harker expects to drain the water from the incline in a short time, when development will be renewed. The mine is looking well and producing regularly.

IRON SILVER.—The Stone mine continues making an average daily output of two hundred tons of ore. The large production of the property necessitates economy in handling the ore, and to provide proper facilities, a large force is engaged in surface improvements. About forty men are employed in grading and cutting away a portion of Iron Hill, in order to make room for the large ore-bins, now at the Rock mine, which are to be removed to this side of the gulch. The No. 6 Stone shaft, situated on the north side of the road, having a depth of sixty feet, and formerly used exclusively as a timber shaft, is to be utilized in hoisting ore. At the Moyer shaft, work is at a stand-still, except the steam-pumps, which are kept in operation maintaining the shaft's freedom from water to some extent, though of insufficient capacity to permit the sinking of the shaft, now down one hundred and ninety feet, to greater depth.

THESPIAN SHAFT.—The shaft on Carbonate Hill has recently passed through the contact-matter and struck lime at a depth of about six hundred feet. Drifting in the limestone has been commenced, and it is hoped that a chute of mineral may be encountered at no great distance from the shaft.

SUMMIT COUNTY.

CLINTON.—A correspondent of the Denver *Republican*, in speaking of this mine, says that the mining operations in that camp are in a very prosperous condition, with the promise of an increased ore output for the coming year. The Clinton especially has rapidly enhanced in value under the extensive development which has been made. The mine is now opened by an incline 550 feet in length, from which six levels are extended, having an aggregate length of 300 feet. All these headings are in ore of shipping grade, and the daily output is now thirty tons of a value of $30 per ton. Thirty men are employed and a tramway is constructing by which the ore will be delivered to the track of the Rio Grande Railroad about 1000 feet distant, at the base of Battle Mountain.

QUEEN OF THE WEST.—The Ten Mile *News* says that the mine has shut down. The prevailing opinion, which seems to gain ground from the reticence of the owners, is, that the mine has been sold.

ROBINSON.—The mine continues to ship about three or four car-loads per day, which, it is presumed, includes the shipments made by Mr. Doolan from his lease, which will expire on the first of March.

WHITE QUAIL.—The company has paid off its indebtedness to George R. Fisher & Co., and as soon as the sheriff's fees, over which there is some dispute, are adjusted, work will be resumed on the mine.

DAKOTA.

CALEDONIA.—The company is sinking a winze from the 100 level to the depth of 150 feet. The winze is now down thirty feet. The mine shows marked improvement, the ore-body having a width of eighty feet.

FATHER DE SMET.—The report of the superintendent for week ended February 15th shows ore extracted from first, second, and third levels, 1750 tons; ore milled, 1800 tons. Water short from the 8th to 13th inst. Third level header advanced 6 feet; header in, 134 feet; Italian winze advanced 12 feet; winze down 53 feet; north end tunnel advanced 10 feet; tunnel in 815 feet.

FLORENCE.—The mill is still idle. Machinery for its enlargement is awaited.

SITTING BULL.—The smelter will fire up March 1st.

SUMMIT.—The mill is in successful operation on Initial ore.

GEORGIA.

The Dahlonega *Signal* says:

GOLDSMITH.—The new placer is worked. The company has been washing off the clay for the past week, and intends to wash the gravel this and next week. A ditch from the Fish Trap extension has just been completed, and a reservoir 1000 feet in length. After every thing is ready, the intention is to run a little giant, which will reduce expenses greatly, and increase the yield.

IDAHO.

POCAHONTAS.—This company has been organized to develop the well-known Washington lode, which is situated five miles north of Galena, on the mountain that divides the waters of the Wood and Salmon rivers. It outcrops the entire length of the claim—1500 feet. A smelter will be built by the company the coming summer.

SAWTOOTH GOLD AND SILVER MINING COMPANY.—This company has been organized in San Francisco to develop the Jupiter, Justice, Ophir, and Midnight mines. The mines are located within one mile of Sawtooth, in Beaver Cañon. The Jupiter is opened by a shaft 125 feet deep—at which depth the ore-body is 38 inches wide and ore is in the shaft all the way from the surface down, averaging 38 inches in width. The Justice is a smaller vein, dipping at an angle of 45 degrees, and is in granite formation with a slate hanging-wall, and strong, heavy clay gangue on the foot-wall. The vein-matter is quartz containing ruby silver, which has produced up to $1900 in silver and $420 in gold to the ton. The silver ore is black sulphurets, ruby, and stephanite. The vein carries 11 inches of ore at a depth of 35 feet, which is the lowest point yet reached on the vein. The Ophir is a 35-foot vein, cut across on the surface from wall to wall, and all the ore exposed is free milling and averages 57 ounces in silver per ton. It crops out strong a distance of two miles, and carries a uniform width of 35 feet. It is quartz carrying ruby, native, and wire silver, and some gold. The Midnight is not much developed, as the deepest work on this mine is 12 feet. The ore is continuous and free milling, ruby, stephanite, and native silver, carrying 135 ounces to the ton, and some gold. The vein is 28 inches wide. A new mill is to be built.

MAINE.

HERCULES.—Work upon this mine, says the Bangor *Jonrnal*, was suspended last fall from lack of funds, as some of the stockholders declined to pay their assessments and the management was unwilling to run the mine into debt. The mine itself never looked so promising as on the day it was shut down. The ore-vein was more than four feet thick and rapidly widening, of nearly solid zinc-blende

Digitized by Google

and galena, containing scarcely any rock. During the past few months, several of the leading stockholders have been quietly buying up the shares held by the obstructionists, with a view to place them in the hands of those who will be willing to assist in pushing the work of development in the spring, and arrangements are now making to start up the mine about the first of April. Every thing at the mine is in perfect working order, and the facilities for shipment are excellent, the company's new wharf being probably the best in Hancock County.

MEXICO.

We have received the following letter:

I see, by your issue of December, 9th, a notice of the Candelaria of this place, which calls for a word of comment from me. It is remarkable principally for the number of errors that are compressed into so few lines, being an epitome of a report by Mr. R. E. Chism, who was here as my book-keeper for a year and a half, and afterward in charge of the property about a year more. Mr. Chism was aided in his suits by two lawyers, Don Francisco Alvarado and Don Luis Fernandez. The "unscrupulousness" of Don Toribio Rocha consisted in trying to collect a just debt which has since been paid.

As "one Temple, a former officer of the company, who seems to be ignorant on all questions of mining," was appointed by the court "*interventor interino*" (receiver) in one of the suits, and in that capacity found it necessary to put Mr. Chism in jail, it is quite natural that in Chism's eyes he should be "ignorant on all questions," not only of "mining" but every thing else. A. V. TEMPLE.

SAN DIMAS, MEXICO, Jan. 24, 1888.

A German firm proposes to put up reduction-works at Chihuahua, shipping the product to refining-works in Germany.

The foundations for the concentrating-works now erecting on the banks of the Pachuca River by the American Company are well under way. The work is under the direction of Superintendent D. Browne, who has general charge and management, and is pushing the work rapidly. Mr. A. J. Elian has been appointed master-mechanic of the works.

Extensive machinery for the new Progreso reduction-works at Pachuca has arrived at Vera Cruz, and will be erected at once.

The Atargea mine of El Chico District, Hidalgo, is now drained by an adit, and stopes are opening on a rich body of ore discovered just before the influx of the water. The adit works well, and the extraction of ore is more than sufficient to cover expenses, though the stopes on the ore-body are not yet fully opened.

NEW YORK MEXICAN MINING COMPANY.—At the annual meeting held in Covington, the following officers were elected: President, Ira A. Hutchinson, of Columbus; Vice-President, J. M. Clark, of Cincinnati; Second Vice President and General Manager, resident in Mexico, A. B. Clark; Treasurer, C. O. Lockard Cincinnati; Secretary, Edward Worthington, Cincinnati. The report shows that the company has its machinery in operation, and it is now engaged in taking out and reducing its ore. The returns are of a nature that fulfill expectations, and leave no room for doubt as to the profitableness of the work.

MICHIGAN.

Custer Mining Company. Operations, Michigan. Officers, President, John McKenna; Vice-President, James H. Gee; Secretary and Treasurer, James H. Malloy; Directors, John McKenna, James H. Gee, James H. Malloy, Hugh McLaughlin, James M. Gray. Summit Exploring, Mining and Manufacturing Company. Capital, $1,200,000. Operations, Michigan. Directors, G. M. Wakefield, J. R. Morgan, D. L. Libbey, J. L. Mead, J. B. Davis, H. H. Stafford. Tobin Exploring, Mining, and Manufacturing Company. Capital, $600,000; 24,000 shares. Operations, Michigan. Officers, President, James Tobin; Vice-President, G. H. Gile; Secretary, E. T. Ellsworth; Treasurer, Frank Heilig; Executive Board: G. M. Wakefield, G. H. Gile, and George A. Fay.

CENTENNIAL.—The stamp-mill has been temporarily shut down, and other surface work, except such as is absolutely necessary in conjunction with underground operations, has been discontinued. Operations (underground) will for the present be confined to sinking and drifting. The openings at bottom and on either side of Nos. 1 and 2 shafts are looking very well, and sinking will be pushed in both, at the same time the second level drift will be carried north to connect Nos. 1 and 2 shafts as speedily as possible.

MONTANA.

BELL.—A contract has been let to sink a three-compartment shaft to the depth of 400 feet, the contractors stipulating to complete the work in one hundred days. While the shaft is sinking, no extensive operations will be conducted in the old workings, and most of the force has been laid off. The new shaft will be sunk about midway between the two ledges and at a point 60 feet east of the present main shaft, or 500 feet east of the west end line. At the depth of 300 feet, it is the intention to connect the new shaft with the old workings by a cross-cut run south from the latter, and thereafter the two old shafts will be abandoned for hoisting purposes. At a depth of 400 feet, north and south cross-cuts will be extended from the new shaft to intersect both ledges, and as soon as possible thereafter the smelter will be started at its full capacity. One furnace, however, will be fired up about the middle of April on ore which has been already extracted, and of which there is between $50,000 and $75,000 worth available for reduction at the smelter.

BROADWAY.—The sinking of the shaft to prove the further extent of the ore-body will be continued. Should the result of the development prove satisfactory, the mill will be refitted with new machinery and the treatment of the ore under a new and improved process will be resumed.

MOULTON.—During the past month, work has been vigorously pushed on the south cross-cut from the west 300. The vein has now been penetrated a distance of 14 feet, a small streak of very rich ore was cut into, a picked sample from which assayed 478 ounces. The vein pitches a little southward and trends westward, and a west drift on the vein has been started. Development in the north drift of the 300 last week was also quite satisfactory, an 18-inch ledge of high-grade ore having been uncovered in the west drift from the north cross-cut. Sufficient ore is produced to keep the 40 stamps at the mill constantly dropping. The mill is making a remarkable run, having now run fifty-five days without an hour's stoppage.

NEVADA.

The Berryman Tunnel and Mining Company has filed articles of incorporation. The trustees are: Henry K. Mitchell, Louis Dibber, D. R. Sessions, M. H. Joseph, and Richard Berryman.

ALBION.—A large number of heavy attachments against the company were filed in the county clerk's office at San Francisco recently. There appeared to be concert of action on the part of many creditors. The total amount of attachments so far filed is $61,027. It is alleged that if claims are presented in a similar way, the amount will reach $150,000. It is stated that work in the mines continues, and one furnace is kept running to its fullest capacity.

EUREKA TUNNEL.—A strike was made recently in what is known as the Sullivan chamber of the Eureka tunnel, some sixty feet below the tunnel level. The face of the drift is all in ore, which extends below, above, and on both sides, for a distance of six feet in. Two assays made from the new find go $125 and $150 per ton. The ore is of the character common in the mine. It is stated that the mine is looking remarkably well generally, and that ore has been found in several other places, with favorable indications for prospecting.

TUSCARORA.

NAVAJO.—The latest official information is to the effect that there is sufficient ore broken down in the stopes of the mine to run the mill for nine months; that the 450 level is developed by winzes, and the level opened, from which no ore has been extracted; that the mine has large ore-reserves above the 350 level, and is shipping $80,000 per month from a 10-stamp mill. The company has $150,000 cash in the treasury.

WISCONSIN.

The Silver Creek Mining and Milling Company has filed articles of incorporation. The capital is $500,000.

WYOMING.

A correspondent of the Salt Lake *Tribune* reports on some mines situated in the Miner's Delight Mining District as follows: About a year ago, some miners who were working some placers in Strawberry Gulch struck a ledge crossing the gulch, in an east and west direction, the decomposed (barren) rock, as they thought, looked so favorable, they concluded to pan some of the same, which they did with favorable results. They immediately located a quartz vein, calling the same the Bullion. A shaft was sunk and a ten-stamp mill erected. The first clean-up resulted in $16 per ton, the second in $22, and the third in $29. While water is found within less than five feet of the surface on the ledge, still the same can not as yet be procured in desirable quantities for running the mill steadily. A well has been sunk at the mill forty-two feet in depth, which has served to keep the mine dry (the deepest shaft sunk on the ledge being twenty-seven feet). Prospecting has been done in various places on the claim, and everywhere the ore is uniform in value with that at discovery. It has been stripped on the surface for 100 feet in width on the ledge with like results. The character of the ore in the First West Extension, the Second (Midas) and Third (Dahlonega) extensions of the Bullion is the same as that found in the Bullion, but there has been no development of either of the three properties mentioned. The ore in a claim situated about two miles from the Bullion appears to be different from that found in any of the above-mentioned claims, being black slate and iron, and from assays shows from $90 to $160 gold per ton. The vein is said to be five feet wide. Several other claims which show favorable prospects will be developed by the owners in the spring. There are within a radius of twelve miles of Strawberry Gulch, seven mills, some steam, some water, with from five to twenty stamps, the owners of which would work ore, or possibly sell. An abundance of timber, with splendid roads to haul the same. There is an abundance of water in Rock Creek, Willow Creek, and Sweetwater for running water mills. Hundreds of claims are lying idle, and many others which are worked could be purchased at reasonable prices.

the extent of 800 shares at $5⅛@$5. North Belle Isle had a moderate business at irregular prices; it sold from 57@53@54c. Independence declined from 70@60c., under a small business. Elko Consolidated was active and irregular, selling from 12@9@@10c., with a business of 16,100 shares.

In the miscellaneous list, Alice has had a fair business, but has grown weak; it declined from $3.55 @$3, closing at $3.05. Bassick showed considerable strength, with a small business, selling from $8¼@ $10½. Eureka Consolidated was quiet and irregular, selling from $10½@$9¼@$9½. The Green Mountain stocks were quiet and weak. Gold Stripe sold at 8@7c. Green Mountain declined from 70@60c. and then reacted, and closed to-day at 70c. Rising Sun sold from 7@4c. and Cherokee at 5@6c. Horn-Silver has shown considerable strength, under a fair business; it sold from $7@$8¼@$8. Robinson Consolidated has been active and weak; it sold from $1.10@ $1@$1.05. Sierra Grande sold ex dividend this week, and has been very irregular, under a large business; it ranged from $3.35@$2.60@$2.90, closing to-day at $2.75, sales aggregating 24,925 shares. Silver King has been strong with small sales, selling from $10¾ @$11.

Alta-Montana records a fair business at steady prices, selling from 11@14@11c. Bradshaw was quiet and steady at 31@30c. Central Arizona records a small business at irregular prices, selling from 42@37 @40c. Decatur has been very active and a little weak; it sold from 11@6@7c., with a business of 75,600 shares. Harlem M. & M. Co. has been quiet and steady, selling from $1.15@$1.20. Oriental & Miller was very actively dealt in, but shows no material change in price; it sold from 13@15c. Rappahannock sold at 9c., with a moderate business. Red Elephant has had a moderate business at steady prices, selling at 7@8c. Silver Cliff has been quiet and steady at 40@48c. Sonora Consolidated records a very active business at strong prices; it sold from 35@38c., the sales aggregating 103,600 shares. South Pacific has been active and weak, selling at 7@5c. The State Line stocks have been quiet; Nos. 1 & 4 sold at 4@3c., and Nos. 2 & 3 at 7c. Taylor-Plumas was steady at 17c. throughout the week, and was actively dealt in at that figure.

The collapse of Gilbert L. Crowell, who was the chief backer of the Empire mine, Park City, Utah, has been a surprise to his friends, although in mining circles his faith in the future of that mine was not shared. It was claimed by those interested in the mine that it was on an extension of the famous Ontario. A mill, which was put up before the condition of the property warranted its erection, burnt down, and there were other troubles which made the development more costly. Utah dispatches state that the mine is in debt to the extent of $65,000, of which $36,000 is due to Utah parties.

According to all appearances, the scheme to consolidate the New York Mining Exchange and the New York Petroleum Exchange has been dropped.

The recent decline in the price of the shares of the Green Mountain Gold Mining Company is owing to the appearance of an advertisement by the sheriff of Plumas County, Cal., in the *Plumas National* newspaper, offering the company's property for sale to pay delinquent taxes; also to the fact that, on account of want of water, the company's three mills, of 92 stamps, have been closed; and also to a demand having been made on the New York office for funds to pay the miners their back wages. The work of running tunnel No. 6 is progressing favorably, and if the company can pull through the next ten months without losing its property, it is believed all will go well, as in that time the Blake chute, it is believed, will be producing rich ore. It is in the power of the stockholders to save this valuable property to themselves, by taking the balance of the unsold bonds, thus furnishing the company with funds to tide over the present emergency.

MEETINGS.

Atlantic Mining Company, No. 76 Wall street, New York. Annual meeting of stockholders and election of trustees, March 13th, at twelve o'clock M.

Conglomerate Mining Company, No. 205 Walnut place, Philadelphia. Annual meeting of stockholders and election of trustees, March 15th, at three o'clock P.M.

Hancock Copper Mining Company, Hancock, Michigan. Annual meeting of stockholders and election of trustees, March 5th, at two o'clock P.M.

Minesota Mining Company, No. 98 Broadway, New York. Annual meeting of stockholders and election of trustees, March 21st, at two o'clock P.M.

Osceola Consolidated Mining Company, No. 69 Devonshire street, Room 15, Boston. Annual meeting of stockholders and election of trustees, March 8th, at twelve o'clock M.

Pewabic Mining Company, No. 19 Congress street (Rooms 11 and 12), Boston. Annual meeting of stock, holders and election of trustees, March 28th, at twelve o'clock M.

Sherbrooke Gold Mining Company, No. 101 Duane street, New York. Annual meeting of stockholders and election of trustees, March 7th, at twelve o'clock M.

United States Ore Milling Company, office of Mr. E. Mygatt, No. 36 Broad street, New York. Annual meeting of stockholders and election of trustees March 8th.

DIVIDENDS.

The Bulwer Consolidated Mining Company, of California, has declared a dividend (No. 16) of five cents per share, payable March 12th at the Farmers' Loan and Trust Company. Transfer-books close March 2d, and reopen March 13th.

The Castle Creek Gold Mining Company, of Idaho, has declared a dividend (No. 10) of three per cent on the capital stock, payable March 16th. Transfer-books close March 10th, and reopen March 17th.

The Charleston, S. C., Mining and Manufacturing Company has declared the usual quarterly dividend of $1.50 per share and an extra dividend of $1 per share on the capital stock, payable on and after March 1st at the company's office in Philadelphia.

The Holyoke Mining Company, of Idaho, has declared a dividend (No. 6) on the capital stock, payable March 10th. Transfer-books close on the 3d and reopen on the 12th.

Dividends paid by mining companies during the month of February, and from January 1st, 1883:

PIPE LINE CERTIFICATES.

Messrs. Watson & Gibson, petroleum and mining brokers, 55 Broadway, report as follows for the week ended March 2d:

The market has been depressed during the week by the uncertain development of Grandin well No. 5. At the final moment, when it struck sand, the market fluctuated in accordance with the rumored showing, some reports asserting it to be a "gusher," others pronouncing it small and unimportant. The latter has proved true, but the market has been left in a comatose state.

Dullness in oil is almost equivalent to a decline, as carrying charges are constantly running against the holder.

There is more bearish sentiment developing than has existed for some time, based upon the fact that consumption is not outrunning the production as was expected, and that more wells and rigs are in progress than a month ago.

On the "bull" side, it is shown that there has been a decline in the new Forest County wells between January 31st and February 28th of about 700 barrels daily; that the shipments from the oil regions must soon increase, and thus change the present showing of the Pipe Line Company which is an increase of stocks on hand. The enlargement of the constituency of New York petroleum brokers has brought much oil to this city, and into strong hands, who are holding for an advance. This increased absorption of certificates makes a quick and sharp advance probable within the next few weeks. It has been impossible to break it below 97¾c., and for a dull market it exhibits considerable strength.

The following table gives the quotations and sales at the New York Mining Stock Exchange:

	Opening.	Highest.	Lowest.	Closing.	Sales.

Copper and Silver Stocks.

Reported by C. H. Smith, 15 Congress street, Boston, Stock Broker and Member of the Boston Mining and Stock Exchanges.

BOSTON, March 1.

There is absolutely next to nothing doing in copper stocks, the past week being the dullest of this dull season. Calumet & Hecla sold in small lots at $243, but a ten-share lot being placed on the market, caused a drop to $242. Franklin was barely steady at $13, buyer sixty, with regular stock selling at $12¾. Pewabic was very weak, notwithstanding the report of a rich find in one of the lower levels of the mine; a lot of 600 shares being pressed upon the market, forced the price down to $7½, the last regular sale (21st inst.) being at $9¾. Quincy has been fairly steady at $50, although a lot of 300 shares was sold at $49¾. Osceola was firm but dull, at $31. Allouez sold at $2½, and National at $1⅛. The aggregate sales for the week foot up only about 2000 shares, which fully indicates the extreme inactivity of the market in this class of securities. The outlook for the future is not very encouraging, there being no disposition with the public to speculate in mining stocks.

In silver stocks, the recent law enacted in Colorado taxing net proceeds of the mines in that State has had a depressing effect on Catalpa and Crescent, two of the most active mining stocks in this market, the former declining from 80@60c. and the latter from

30@25c. The rest of the market was entirely neglected.

At the Boston Mining and Stock Exchange, Massachusetts & New Mexico continues to be active at 7@9c. per share. Empire is also in good demand and has advanced from 24@29c. Brunswick Ship's Berth Company, a new stock recently listed, has been quite freely dealt in, and advanced from 40c.@$1.20, with later sales at 90c.@$1. Simpson Gold Company, of North Carolina, which started up again into activity a few weeks ago and sold from 2c. up to 8c., has declined to 4c., with very little doing.

3 P.M.—There was no change in the market this afternoon. Quincy sold at $50. Silver Islet, $5¼@$5. Bonanza, $2¾. Closing prices: Antimony, $14 bid, $15 asked. Bonanza, $2½ bid, $2¾ asked. Catalpa, 60c. bid, 70c. asked. Crescent, 27½c. bid, 35c. asked. Franklin, $12⅛ bid, $12¾ asked. Harshaw, $1 asked. Huron, $1¾ asked. National, $1⅛ bid, $1¼ asked. Osceola, $30½ bid, $31 asked. Pewabic, $7¼ bid, $7½ asked. Quincy, $49¾ bid, $50 asked. Silver Islet, $5 bid, $5½ asked. Sullivan, $⅞ bid, $1 asked.

BULLION MARKET.

NEW YORK, Friday Evening, March 2.

The silver market abroad has been firm the past week on steady East India exchanges, but has been lowered here by a decline in sterling exchange.

DATE.	London Pence.	N. Y. Cents.	DATE.	London Pence.	N. Y. Cents.
Feb. 24	51	110⅞	Feb. 28	51	110¾

United States Mint at Philadelphia.—The coinage executed at the Mint during February amounted to 6,265,440 pieces, valued at $1,100,360. This was composed of 40 double-eagles, 40 eagles, 40 half-eagles, 40 three-dollar gold pieces, 40 quarter-eagles, 1240 gold dollars, 900,000 silver dollars, 610,000 dimes, 2,224,000 five-cent pieces, and 2,530,000 cents.

Bullion Receipts at New York.—The bullion received from the mines at the various offices in this city during the week ended March 2d, as compiled from various sources, amounted to $363,463.06, as against $209,130.38 reported for the previous week. The receipts from January 1st, 1883, to date are $2,643,501.11.

Nevada	10,000.00	
New Mexico	18,000.00	
Utah	103,200.00	
Refined silver	234,000.00—	497,000.00
Total deposits		$1,431,000.00
Gold bars stamped	$2,144,795.00	
Silver "	466,114.00—	$2,610,909.00

Foreign Bank Statements.—The governors of the Bank of England, at their regular weekly meeting, reduced the minimum rate for discount from 3½ to 3 per cent. During the week, the bank gained £167,000 bullion; but the proportion of its reserve to its liabilities was reduced from 44 1-16 to 43 per cent, against 37 11-16 per cent at this date a year ago. The weekly statement of the Bank of France shows an increase of 1,800,000 francs gold and a decrease of 1,050,000 francs silver.

METALS.

NEW YORK, Friday Evening, March 2.

Copper.—The market again shows signs of being demoralized. Lake has sold as low as 17¾c. in small lots as they came into the market, and on the part of buyers there does not seem to be any eagerness to take what little is offered even at that. For other kinds of copper, we note that large bids have been made for Baltimore, at considerably below 16c., but have been declined.

England cables £65 10s.@£65 15s. for Chili Bars, and £72@£72 5s. for Best Selected. The Chili charters for the first two weeks of February have been exceptionally light.

Digitized by Google

Tin.—A moderate business has been done, the feeling being better for futures, however, than for spot. Sales during the week aggregate from 250 to 300 tons, the market closing at 20⅞@21c. for Straits.

Lead.—The deadlock here remains unbroken, the only news of any interest, though not affecting the market, being the burning of the St. Joe works. There has not been a single wholesale transaction either in common or corroding lead. We understand that some Richmond lead was offered at 4·55c., but found no takers. It is likely that a few hundred tons, widely distributed, could be placed at 4·50c., which is bid.

Holders are very firm. Those Western smelters who contracted for ores on a falling market, both for lead and for silver, with a slow competition in smelting charges, are not inclined to sell at the loss which present quotations would entail, and appear to prefer to hold on for better prices. On the other hand, manufacturers are fairly well supplied for some time to come.

Messrs. John Wahl & Co., of St. Louis, wire us as follows to-day:

The market is very steady at some advances on last week's quotations, with a good demand for chemical lead. Sales for the week sum up over 250 tons of Hard lead, at 4·25c., and 200 tons of Refined at the same price.

Spelter.—There is nothing new to report. Common Domestic is quoted 4⅝@4¾c., but it would not be easy to market any considerable quantity at the former price.

Antimony.—The feeling is better. Hallett's is well sold ahead, and is nominally 10@10½c., while Cookson's is firmer, in the absence of the former brand, it being quoted at 11@11½c.

IRON MARKET REVIEW.

NEW YORK, Friday Evening, March 2.

American Pig.—The market is decidedly weaker, and there is some talk about the prices to be fixed for next season's delivery, the time for these contracts being at all events close at hand. It is considered very probable that there will be shading. We quote $23.50@$25 for standard to choice brands of Foundry No. 1 at tide-water, and $21.50@$22.50 for No. 2. Gray Forge remaining at $20@$20.50. Bessemer Pig is dull and unchanged both here and in England, the nominal range at tide-water being $22@$22.50. Nothing has been done in spiegeleisen, which is nominally $26@$27 for 10 to 12 per cent, and $32@$33 for 20 per cent.

Scotch Pig.—Business has been dull, arrivals being 1600 tons, of which 1200 tons have gone into consumption. Freights are unchanged at 6s. 6d. We quote Coltness, $24.75@$25.25; Glengarnock, $22@$22.50; Langloan, $24.50@$25; and Eglinton, $21@$21.50. The Wall Street Exchange has received the following Glasgow quotations by wire to-day: Carnbroe, 55s. 3d.; Gartsherrie, 61s. 9d.; Summerlee, 62s.; Coltness, 64s. 9d.; Langloan, 64s. 6d.; Glengarnock, 55s.; and Eglinton, 49s. 6d. Warrants were 47s. 9d.

Rails.—Business is limited in character. For early delivery, Eastern mills are fairly engaged, and some are delivering orders which go to Western mills and make the latter busier than they have been. We quote here $39@$40 at mill, at St. Louis $45, and at Chicago $42.50.

Old Rails.—These are fairly steady with some sales at $24.25@$24.75 for Ts, and $27@$27.50 for D.Hs.

Scrap.—Very little is doing at $24.75@$25.50 as the nominal range.

It is now probable that a tariff bill will pass. As we go to press, the news is received that the Conference Committee has reached an agreement which fixes the duty on iron ore at 75 cents, the rate on pig-iron at $6.72, on steel rails at $17, on steel valued at 4 cents per pound or less, 45 per cent, valued at 7 cents and less than 11 cents, 2¾ cents duty, and above 11 cents value, 3¼ cents per pound. In other items of the metal schedule, so far as learned, the duties are those proposed by the Senate bill.

Philadelphia. March 2.

The iron situation in Pennsylvania has improved slightly. At present writing, the protectionists see a few glimmers of hope, which, if realized, will place them in a better condition than they contemplated a week ago. A growing feeling of the past few days has pointed to the probable postponement of tariff legislation until next winter; but withcertain modifications of the present metal schedule, a prompt decision would be more acceptable to the greater portion of the iron interests here and throughout the West. Prices have been quite uniform all the week, in view of the adjournment of Congress this week, and the settlement of tariff duties thereby. Several buyers have made their appearance with requirements, which they intend to place next week if prices and delivery suit. No rise in prices is thought probable, but at the same time the possibilities are sufficiently strong to induce some few large consumers of iron and steel to place their requirements for 60 or 90 days to come at this time rather than make further delay, though their action in this respect will be determined largely by the results to be reached between this hour of writing and Saturday noon. There are several encouraging features in the iron market, notwithstanding many discouraging ones. The great factor of railroad construction is assuming a more encouraging aspect. Several hundred miles of road will be undertaken in the North and Northwest in the spring, and completed, if possible, before the coming of cold weather next winter.

Rails.—Makers are confident that, with fair advantages, their mills will be busily employed throughout the year, especially in the East, and at about $40 per ton, though less positive statements can be made of Western mills. A few transactions have taken place this week at a little below $40, and there are offers in hand which makers do not feel justified in accepting at present. There are a good many requirements to be filled, and makers think they will be placed during March, though buyers will hold back to the last hour because of the fact that Eastern mills are filled for months and a good many risks are to be run before contracts can be executed.

Bessemer Pig is without any activity, and quoted at $22.50. Buyers are waiting for better prices, and say they will not pay over $21 at tide-water. A few small lots of Scotch iron sold at bottom figures.

Merchant Bar.—Small lots are selling at about 2·30@2·35c. Stocks are sufficiently large to meet all requirements. Card rates are not easily maintained at mills; but notwithstanding the decline in prices, manufacturers are not disposed to accept contracts for remote delivery, neither will they place orders for forge iron at $20@$21, though at present cost of production no decline in prices are probable.

Bar-Iron is moving quietly all the way from 2@2·30c., and mill owners are waiting for the disturbing elements to disappear. Skelp-Iron is 2·20@2·40c. Wrought Pipes are 67½@70 off small sizes, and 55 per cent off card list for Boiler Tubes. Several orders are to be placed next week.

Sheet-Iron is moving in small lots, as usual, and consumers are waiting for bottom prices to be reached before placing requirements for supplies for the spring and summer. The output will be absorbed in meeting the spring trade. Stocks are larger than they have been for several months, and there is confidence that the future demand will be large.

Hardware for the spring trade is in improving request, and jobbers from the West and South are placing orders.

Angle Iron is quoted at 2·50c.; Tees, 3¼c.; Beams, 3½c.; Channel Iron, 3¾c. Manufacturers have a few specifications in hand, and will do some business next week for April delivery.

Plate and Tank is in improving demand, though prices will not probably feel the impulse, as books are empty of orders and the volume of the demand is uncertain. Tank Iron is quoted at 2½c., though sold at less. Shell is 3⅛c.; Flange, 4⅛c.; Fire-Box, 5¼c. Manufacturers expect to do a fair business, though they have very little to speak of for several weeks past. As to the probabilities of heavy requirements during this and next month, different opinions have been expressed, but a careful summing up of the situation justifies the opinion that the demand will be no less than last spring, and that prices will not be quite as strong.

Steel Rails are in an uncertain position and are quoted at $39@$40. No large requirements have been placed for several weeks, and there is an accumulating demand which is likely to be put upon the market at any time now that uncertainties as to tariff duties have been virtually removed and railroad companies can figure down cost. There are rumors that contracts will be placed at $38, but they can not be traced to authoritative sources.

Old Rails are weak at $25.50@$26 for Tees quoted, though no sales are mentioned. Sellers of Double-Heads are offering them at $27@$27.50 for shipment to tide-water. Railroad Scrap sold at $28. No. 1 selected from yard sold at $27.50. A few small lots of Scrap sold at $26.

Cleveland. Feb. 27.

[Specially reported by H. S. MOULD & Co.]

The feeling in the iron markets is still one of uncertainty, and is decidedly unsatisfactory, but still has assumed some more encouraging features since our last report. Trade continues in a small way, and consumers only buy from hand to mouth. Stocks of Foundry Irons are exceedingly light, and, should the trade buy in their way, they would quickly exhaust furnace stocks. American Scotch or good soft irons are particularly scarce, and command relatively more than strong irons. The ore trade remains practically at a stand-still. We quote:

No. 1 Bessemer	$23.50@$24.00
" Foundry, all ore	22.50@ 23·50
" Foundry, cinder mixture	22.00@ 23.00
" Soft Foundry	21.50@ 23.00
" Open silvery	21.50@ 22.00
Mill Irons	19 50@ 22.00
No. 1 and 2 Charcoal	26 50@ 27.50
" 3, 4, 5, and 6 Charcoal	27.00@ 28.00
Hanging Rock Charcoal	23.00@ 26.50
Strictly Cold-Blast	28.50@ 31.00
Four months, f. o. b. cars Cleveland:	
Bessemer ores	8.50@ 10.00

COAL TRADE REVIEW.

NEW YORK, Friday Evening, March 2.

Anthracite.

The anthracite coal trade continues dull, though in some quarters a slight improvement in the demand is reported, particularly so far as steam sizes and pea are concerned. The representatives of the companies have had a number of conferences in relation to the fixing of opening prices for the season. The feeling seemed to prevail that it would not be judicious to take any steps until navigation is opened, and it has been accordingly decided to let things alone until the 1st of April. It is reported that the figures contemplated will be $3.80, $3.90, and $4.35, though the latter one, for stove, is considered too high by some authorities in the trade. It is certainly the policy which the companies are bound to pursue to make these prices as high as they reasonably can, in order to make their contracts covering large periods remunerative. This feeling probably will make them continue the policy of restricting during the rest of the month, and as there will be fifteen idle days, there is little doubt that the market must experience at least a temporary revival. Much is apparently expected from the general resumption of buying to follow the adjournment of Congress, but there are those who very strongly insist that the hopes of the improvement in the manufacturing industries will not be realized. The developments of the next few weeks will be watched with close interest.

Bituminous.

The interest in the bituminous trade still centers in the question of freight rates on the Baltimore & Ohio and Pennsylvania railroads. A few figures will best serve to place the entire matter in the right light. The circular of the Pennsylvania Railroad provides for the following rates, from Clearfield, Snow Shoe, Broad Top, Sonman, etc., per net ton:

To South Amboy	$2.90
To Greenwich, destined to points south of Wilmington and outside the Capes	2.08
To Greenwich, points on river front	2.38
To Philadelphia, city delivery	2.50
To Baltimore, shipment	2.00
To Baltimore, city delivery	2.25

The Baltimore & Ohio rates are as follows to the Locust Point shipping wharves:

From Cumberland	$1 62
" Piedmont	1.83

Basing calculations on these figures, the transportation charges on Cumberland coal alongside New York via Baltimore would be $3.50; taking the barge freights the same as last year's contracts, $1.25. Clearfield coal via South Amboy, alongside New York, would have to pay $3.70 for transportation, while it would cost $2.55 f. o. b. Philadelphia and $2.48 f. o. b. Baltimore. Cumberland coal could be brought to Baltimore, f. o. b., via Cumberland, for $2.25 and to Georgetown by canal for $1.95. It will be seen, therefore, that Clearfield coal is at a disadvantage so far as freight rates are concerned to the extent of at least 20 cents. The Clearfield shippers have naturally urged the Pennsylvania Company to give them a fair chance, and it seems that there is a prospect of another conference. Meanwhile, we hear that orders are solicited and obtained in a few instances by both Clearfield and Cumberland shippers, which are inconsistent with the freight rates established, in some cases being so low that there can be absolutely no profit, indicating that the Cumberland shippers who have made the offers in question must look to some other source for a margin. On the other hand, Clearfield shippers have taken low contracts, showing that either they are determined not to lose their grip on the market or that they are willing to impress the railroad company in this way.

For current business, there seems absolutely no inquiry, and we quote nominally $4.50@$4.60 for Clearfield and $4.55@$4.75 for Cumberland coal.

Horsford's Acid Phosphate
For Women and Children.

DR. JOS. HOLT, New Orleans, La., says: "I have frequently found it of excellent service in cases of debility, loss of appetite, and in convalescence from exhaustive illness, and particularly of service in treatment of women and children."

How rapidly the mining industries of the Rocky Mountains are developing under the impetus of increased railroad facilities is shown by the traffic returns contained in the annual report of the directors of the Union Pacific Railroad Company. That company carried, in 1882, 349,960 net tons of coal, 20,762 tons of stone and brick, 13,495 tons of cement, plaster, and lime, 16,489 tons of salt, 21,152 tons of metallic ores, and 66,670 tons of other ores and coke. The same road carried 13,522 tons of lead, 57,885 tons of base bullion, and 9232 tons of tailings and matte. The report speaks of the completion of the Oregon Short Line to Shoshone, from which the grading of the branch to the Wood River region, fifty miles long, is completed. The directors make the very important statement that within sixty days the track will be laid. There can be no doubt that, with this connection established, a new and very prolific source of supply will be opened to our markets of lead, which, fortunately, are again beginning to show signs of animation.

THE Bureau of Statistics has just issued its December bulletin, which makes it possible to give the imports and exports for the calendar year, which are more acceptable than those relating to the fiscal year, to which, unfortunately, the government clings with such persistency. The following are the net imports of foreign iron, steel, and metals, that is, making allowance for re-exports, which we do not publish separately, because they are not heavy in any case.

IMPORTS OF IRON, STEEL, METALS, AND CHEMICALS, ETC., IN 1882 AND 1881.

IRON AND STEEL, METALS, AND CHEMICALS.	Quantities.		Values (1000 dollars).	
	1882.	1881.	1882.	1881.
Iron and steel.				
Iron ore, gross tons	589,611	782,887	1,640	2,223
Pig-iron, net tons	602,762	517,196	9,864	8,860
Castings, net tons	2,074	632	115	37
Bar-iron, net tons	78,783	46,927	3,272	2,012
Boiler-iron, net tons	175	260	13	10
Band, hoop and scroll iron, net tons	6,011	818	209	28
Iron rails, net tons	40,876	136,649	1,047	3,452
Steel rails, net tons	146,217	240,749	4,463	7,387
Sheet-iron, net tons	12,945	8,060	789	607
Old and scrap	146,792	134,917	2,733	2,705
Hardware	.....	.....	68	73

Spelter, net tons	12,826	2,755	1,024	210
Sheet-zinc, net tons	2,328	1,824	215	117
Metals, metal composition, and alloys, n.e. sp.	.....	.....	2,026	1,549
Chemicals.				
Chloride of lead, net tons	46,809	43,476	847	822
Nitrate of soda, net tons	75,149	63,307	3,045	2,909
Crude sulphur, gross tons	101,595	117,392	2,674	3,101
Bicarbonate of soda, net tons	1,049	889	53	57
Carbonate, incl. sal soda and soda ash, net tons	165,180	143,703	4,010	3,524
Caustic soda, net tons	29,021	24,700	1,312	1,126
Other salts of soda, net tons	4,984	1,602	66	26
Salt, net tons	408,106	505,008	1,614	1,884
Nitrate of potash, net tons	5,225	6,430	391	479

These figures tell their own story. The noteworthy points are, the striking increase, in the iron and steel list, on steel ingots, bars, wire, etc.; the heavy increase, so far as quantity is concerned, in bar iron; the addition, notwithstanding the adverse position of the markets, to the volume of pig-iron received; and the maintenance of heavy shipments of scrap, although the entire world has been scoured for years to supply our market. Quite a heavy falling off is noted in iron ore, and iron and steel rails. Tin plates head the list with a valuation of nearly 18 millions of dollars. Copper and lead have remained stationary, while copper ore, so far as quantity is concerned, has taken a sudden jump, although the values are unaltered. It is presumed that the bulk of this increase in quantity is due to Canadian and Spanish pyrites. Taking them at an average net yield of 50 pounds of copper to the gross ton, these imports represent approximately 1,800,000 of copper. The most interesting feature in the metal list has, however, been the heavy imports of Silesian spelter, which have now, however, practically ceased, owing to the prevalence of low prices.

Our exports of domestic iron, steel, and metals cut a sorry figure, as the following table will eloquently show:

EXPORTS OF IRON, STEEL, AND METALS IN 1882 AND 1881.

IRON AND STEEL, AND METALS.	Quantities.		Values (1000 dollars)	
	1882.	1881.	1882.	1881.
Iron and steel.

Sheet-zinc and bars	580	641	98	117

The most gratifying figure is that of machinery; unfortunately, we have no details as yet concerning the countries to which it was shipped, nor as to its character; but we have little doubt that a great part, if not the bulk of it, is mining machinery sent into Mexico. This is probably the case also with the greater part of the railroad material. The export of copper ore shows very little change in the above table, because the heavy movement now developed began only toward the end of Novem-

Digitized by Google

ber last year. Altogether, the contrast between the two tables given is one which few who are concerned in the development of American industries will fail to note without dissatisfaction.

WE print elsewhere those provisions in the new tariff bill which are likely to affect our readers. As the new bill now stands, it has very little to commend it, and we are far from believing that it is entitled to be considered a measure which would have grown out of a thorough consideration and discussion of the subject. It was modified in an exceedingly high-handed manner in the Conference Committee, which was not representative of the parties in both branches of Congress, and was pushed through because the majority of members of the House of Representatives and of the Senate did not dare to return to their constituents without having done something to lighten the burden of taxation. How long the question will now remain at rest remains to be seen, and the feeling of distrust on this score to a certain extent lessens the feeling of relief growing out of the fact that for the present the tariff agitation is ended.

It is a difficult matter, in considering many of the clauses, to form any definite idea whether the changes made mean a reduction or not, there having been a re-classification which, in the absence of data, defeats any calculations. Taken as a whole, the reduction on iron has been moderate and on metals has practically amounted to nothing. On steel, the lowering of the duties has been greatest. While it does not, at present prices here, make very much difference to the steel rail makers whether the duty is $17 or $50, it does narrow down their chances of profit in times of great prosperity very materially. Experience during the last decade has shown how extremely fluctuating is the demand for rails. On the other hand, the mills can not stock their finished product and have a heavy outlay of capital and great stocks of raw material, so that steady work is a necessity. They are therefore in a particularly difficult position so far as their future is concerned, standing as they do between a consumer notoriously vacillating and producers of pig and ore who can not respond to their demands promptly.

One of the curiosities of the new tariff is the duty on wire rods. Wire above No. 5 gauge is placed at 0·6 cent per pound; but a few passes through the rolls, bringing it down to a size smaller than No. 5, makes it dutiable at 1¼ cents per pound.

Iron ore, it will be seen, is placed at 75 cents per ton, although the Tariff Commission, the Senate Finance Committee, and the Ways and Means Committee, all recommended 50 cents per ton, and though the Senate and House bills contained that figure. It is stated that Senator MAHONE is chiefly responsible for this remarkable change, which, we presume, is intended to make available the enormously rich deposits of exceptionally low phosphorus ores which Virginians have so persistently claimed to possess. The duty on copper ore has its curiosities. According to the provisions of the tariff, 2 per cent pyrites pay 75 cents, 3 per cent pyrites pay 75 cents plus 2½ cents per pound on the copper, or $2.43, while 3·6 per cent ore pays $2.02. Importers will, therefore, have to shun carefully the range between 2 and 3½ per cent. There is a good deal of talk about the alleged enormous quantities of copper from Canadian and Spanish pyrites with which our markets will be flooded, it being glibly asserted that we may expect 250,000 tons of pyrites, containing at least 5000 tons of copper, which would come in duty free. We import upward of 110,000 tons of brimstone, equivalent to at least 250,000 tons of pyrites, in the manufacture of sulphuric acid. This, therefore, would supply the entire market of the country, provided the use of brimstone was entirely abandoned.

Of the other metals, lead, spelter, and antimony are unchanged, quicksilver taken from the free list and given a duty of 10 per cent, while nickel has been considerably reduced.

THE IRON AGE AND MR. HEWITT.

An anonymous correspondent of the *Iron Age* attacked Hon. A. S. HEWITT in the following words (February 15th):

"As usual, Mr. Hewitt attempts to mislead the public as to his interests in the iron trade, by pretending to be principally engaged in mining iron ore and making pig-iron, whereas these operations are secondary to his main business of rolling iron and steel and drawing wire at Trenton, N. J. He probably consumes five times as much crude metal as he makes in his blast-furnaces in New Jersey."

To this, Messrs. COOPER, HEWITT & Co. replied, in a letter published in the *Iron Age* of February 22d:

"As a matter of fact, when our furnaces are in blast, as they usually are, we make nearly twice as much pig-iron as we consume of pig and scrap together in our works at Trenton, N. J."

In the *Iron Age* of March 1st, the anonymous assailant returns to the charge with a pretended statement of the grounds for his assertion and a deliberate accusation that Messrs. COOPER, HEWITT & Co. are making false representations about their business. The course of the *Iron Age* in permitting such an outrage upon reputable manufacturers, and repeatedly publishing the slanders of a nameless coward, without taking any pains to inform itself, as it could easily have done, as to the facts, is unworthy of its reputation for fairness, and seems all the more surprising in view of the remark of Messrs. COOPER, HEWITT & Co. in their letter of February 19th to the Editor:

"We can not conceive any justification for the admission to your columns of a communication which charges deliberate misrepresentation on our Mr. HEWITT, when, by application to this office, you could have ascertained the facts, so that the correction might have appeared with the charge."

The immediate reply of the *Iron Age* to this dignified rebuke is the publication of the same slander in aggravated form. We can only explain this by supposing that somebody did it while the gentlemanly Editor was absent at Boston, delivering a good-natured satire upon mining engineers, metallurgists, and chemists, in which we do not remember the following stanza:

If Iam an Editor, 'twill be my pride,
Said I to myself, said I,
To bring out the truth from the opposite side,
Said I to myself, said I.
First letting my paper some person abuse,
Then letting the victim reply, if he choose —
Which doubles the "copy," and gives *all* the news,
Said I to myself, said I.

But if the witty poet of the Boston banquet said nothing of this kind to himself, it is a pity that, by an unfortunate oversight, it should become possible for others to say it to him.

As to the last question of fact raised by the anonymous *protégé* of the *Iron Age*, it is sufficient to say that it is the meanest variety of a misrepresentation, because it rests upon the quibble that, at the principal pig-iron works of COOPER, HEWITT & Co., though part of the property is in New Jersey, and part of the work is done in New Jersey, the blast-furnace itself is a few hundred feet over the line, and in Pennsylvania. As this furnace supplies pig-iron to the works at Trenton, its existence and capacity are of course essential elements in the real question, whether COOPER, HEWITT & Co. "consume five times as much crude metal as they produce," or not. By ignoring it altogether, and misrepresenting other facts, the foundation is laid, on which a respectable journal permits Messrs. COOPER, HEWITT & Co. to be accused of lying, for the purpose of securing on false pretenses the passage of laws which would benefit their business.

The unknown sharp-shooter who thus fires from behind the *Iron Age* assumes the capacity of the New Jersey furnaces at 20,000 tons and their product at 10,000. The Durham furnace, which he excludes (though the catalogue of the American Iron and Steel Association, his pretended authority, mentions it in two places in its New Jersey list), produced in 1882, in about ten months of running, 27,264 net tons of pig-iron, or at the rate of say, 32,717 net tons per annum. The product of the last six months of 1882 was 16,454 net tons, or at the rate of 32,908 tons per annum. It is now producing at even a larger rate. These figures, by the way, are probably the best that have been attained in continuous running through long periods by an anthracite furnace with iron hot-blast stoves. They reflect much credit on Mr. B. F. FACKENTHAL, Jr., the manager of the Durham Iron-Works; and we presume the *Iron Age* will be glad to publish them as a matter of news, whatever it may feel bound or not bound to do as a matter of justice.

The tariff struggle being over for a time, and the advocates of higher duties on iron ore having succeeded in getting a small increase, the necessity for employing, as arguments of political economy, personal attacks upon character and motives, has probably passed away; and after the publication of the *Iron Age's* apology, the "incident," as the French say, will be concluded.

CORRESPONDENCE.

[Communications will be noticed only when accompanied with the full name and address of the writer. Unless specially desired, only initials will be printed. We invite criticism and comment by the readers of the ENGINEERING AND MINING JOURNAL. Replies not intended for publication should be addressed to the Editor of the ENGINEERING AND MINING JOURNAL in blank, stamped, and sealed envelopes.]

The Product of the Lexington Mine.

EDITOR ENGINEERING AND MINING JOURNAL:

SIR: Allow me to correct two erroneous statements concerning the Lexington Mining Company, which have crept into your paper. In the first place, in the statement of bullion production for 1882, given in your number for January 13th, 1883, you give the production of the Lexington for 1882 as only $88,508; and further, you class this production with others subject to a reduction of about 13½ per cent.

The Lexington new mill was started a few days before the end of September, 1882, and up to December 31st, 1882, the output from this mill alone was $248,048.22. The Lexington old mill (wet-crushing) ran from September 17th, 1881, to December 31st, 1882, partly on tailings left by the vendor of the Lexington mine, and partly on free-milling ore, and the output from this mill, during 1882, was $168,054.54. Both of these sums represent the actual values realized by sales of bullion, and are subject to no deduction.

The new mill of the Lexington Mining Company has fifty stamps, and is a dry-crushing mill. The old mill has only ten stamps. The total realized value of the output of the Lexington mine during 1882 was therefore $416,102.76.

The second error concerning the Lexington appeared in your number for February 10th, 1883. You there state that, at a meeting of the company held in Paris, France, on the 5th of January, 1883, it was shown

Digitized by Google

that, during the first four months of the working of the mill, it treated 11,800 tons of ore at a gross profit of 647,000 francs, or 56 francs per ton.

I have before me a copy of the proceedings of this meeting, and it was there stated that, since the Lexington mine had become the property of the present company, there had been treated as follows:

Tailings (treated at old mill)	4,369 tons.
Ore (treated at old mill)	1,588 "
Ore (treated at new mill)	5,332 "

It was further stated that the profits earned during the few days in September during which the new mill ran were as under:

Profits during September, francs	47,000
" October, "	110,000
" November, "	254,000
" December, "	236,000
Francs	647,000

These profits were earned by the new mill, and therefore the profit per ton was a trifle over 121 francs instead of only 56 francs. These statements are absolutely correct, and were made from figures furnished by me. I am, dear sir, yours truly,

F. MEDHURST,
General Manager Lexington Mining Company.

LAKE IRON INTERESTS.

Special Correspondence of the Engineering and Mining Journal.

The disasters which have overtaken the iron business since my last letter lend urgency as well as attraction to a further study of the condition and prospects of the industry. Some of our mercurial leaders of public opinion have become pessimistic in the last few weeks, and predict that the decline in general manufacturing and commerce, observable in Eastern and Western circles alike, and rendered still more grave by the recent appalling floods on our Western tracts, and the tide of assignments, justifiable and otherwise, which has lately set in, will show the greatest destruction in the production and manufacture of iron and steel. There are others, on the other hand, who are over-sanguine if not over-buoyant, and who, by the convenient use of arithmetic, predict a certain return of flourishing prices and markets. Both parties have much of truth and much of error; the former, with monocular vision, seeing only the disturbing forces, and the latter, in a similar way, ignoring them altogether. The safe path lies in middle soil. Certainly, the surface history of mills and mines during the past month gives the chronics much leverage on public opinion. The Union Iron and Steel Company has closed down—"for reasons," I am told by one of the stockholders—with a million and a quarter's worth of ore and pig in its inventory; three or four other rail factories have suspended operations, and probably none of our Western mills is running at any considerable profit, even if—which Mr. Potter of the North Chicago Mills denies—they are making expenses. The president of one of the largest rail mills in the country informed a solicitous mine-owner (so I learn from private sources) that he had over two millions' worth of ore and pig in stock, and little or no demand for their manufactured product. The Menominee Iron Mining Company, which had sold over 250,000 tons by the close of January, last year, has heard no inquiries, as yet, for this year's output; and the inspiring and controlling genius of a still larger corporation writes that no sales have yet been effected—and it is the first of March. This last mine has over 150,000 tons unsold in Eastern ports and on its home stock-piles. I learn from local papers that the Republic is as yet without wooers, except at $2 per ton discount on the prices of last season; and as for smaller concerns, they, like the maids of Dee, are languishing for desirable offers, and finding no suitors at all. Evidently, the industry is fallen sick; the pessimists think the malady may carry off the patient, as in 1873; but although this is an untrue interpretation of the symptoms, yet the case is sore enough to require sober counsel on the part of the public physicians.

On the other hand, the Utopians think that the present storm is a short-lived squall, not making it at all essential that mine operators reef even their largest sails. The demand for rails will not fall short of 2,500,000 tons, say they, and the figures were also my own, in my last letter; and to manufacture this, there are but 700,000 tons of ore on hand in furnace markets. *Ergo*, times must be good, and no mistake; and therefore any furnace-man who pins his faith to the statements advanced in your correspondent's analysis of the iron market, published February 10th, will find procrastination to be the thief, not only of time, but of profits also. This view is worthy of careful scrutiny.

In the first place, the supposed demand for rails this year, as given above, is undoubtedly far in excess of any possible interpretation of facts as they now appear. From an independent and, I trust, approximately reliable computation, made from the actual exhibits of individual States, your correspondent is led to reduce his former figures by at least thirty-five per cent, although he does not here lay any claim to infallibility, nor can exact figures be given much before the latter part of May. However, from what data are accessible, we infer that 15,000 miles of road, or its equivalent of 1,600,000 tons of rails, may safely be taken as the maximum demand for 1883. This would ask for a contribution of 3,700,000 tons of ore, or its equivalent in American and foreign pig, as the necessary quotum of the year's product. Shrewd mine operators will accuse your correspondent of gilding over the demand for ores when, in these figures, ores are made to yield an average of only forty per cent metallic iron, when our mines will run nearly or over twice as high and lean ores are abandoned; but this is not, as it seems to me, a delusive calculation, when we contrast the production of pig for 1882 with the amount of rails thrown off by our American mills. Three million seven hundred thousand tons may safely, I think, be taken as the aggregate demand for ores during the season of 1883, although, for the sake of making the calculation as favorable as possible, we will base our figures on a demand for 4,000,000 tons of ore. One widely circulated journal, whose opinion is always deserving of careful attention, just a little color-blind in this instance, naïvely inquires where is this supply to come from? and in answer builds up the comforting theory that ores are to have a fine career during the season of 1883. We answer, and, because the matter involves the outlay of such enormous sums of money, somewhat in detail: Of this amount say 700,000 tons were on hand at the opening of the new year; this would leave not more than 3,300,000 tons at the outside, remaining to be accounted for. But taking the figures of the American Iron and Steel Association as authority, we have something over 810,000 tons of domestic and foreign pig on hand, or an equivalent of at least 1,300,000 tons of ore, doing violence in this computation, in favor of the miners, to our standard of forty per cent metallic iron. This would leave 2,000,000 tons in round numbers, as the demand for 1883. But if the tariff is left in such a condition that it will be profitable to ask our British cousins for as much pig as found its way hither from their furnaces last year, another round million will be to be taken off from the demand from home producers, and 1,000,000 will be left as the total tons to be inquired after in domestic circles. We can now afford to repeat the question: Where is this all to come from? The answer is not far to seek. The Cambria mills of Pennsylvania operate mines whose aggregate output for 1882 fell only a trifle short of 325,000 tons; the North Chicago mills calculate to mine about 100,000 tons from the Metropolitan (I am unaware whether they own other properties); the Cleveland Rolling-Mill Company can easily provide itself with 175,000 tons from its home and Canadian mines; and, not to particularize further, other mills can, if they will, use 300,000 tons (I presume the figures are not half large enough) of *their own* ores. "Where is the rest coming from?"

Of course, in the iron business as in all others, there are small concerns who must pump or drown, and who in a forlorn hope will sell for what they can get, rather than let their properties go under the auctioneer's hammer. To deny that the aggregate influence of such forced sales in a stringent market will have a disorganizing effect is childish if not criminal. Say that these sales amount to 250,000 tons; what then is left for the general trade? Of course, the hard ore mines will receive some offers, though it is hard to see how they will be very massive, and the hematites may likewise be favored with occasional inquiries.

All this is an honest effort to decipher the signs of the times. Forethought is better than hind thought, and trimming one's sails is better than a sudden capsize and ruin of fortune. It may be that the "signs" are not, in this and in my last, rightly interpreted; it may be that business will shake off its melancholy lethargy, the fields pour forth excessive harvests, the carrying trade spring into colossal proportions, manufacturers again rush into production at high pressure, and a balance of trade in our favor throw heaps of money upon the market for investment. Of course, this will inaugurate another boom period, and our mines will be the first to feel the throes of the new life. It is all very pretty, and it is well to hope; but the business pointers do not at this writing look in any respect that way. To sum up: The early part of the season will be dull, owing to accumulated stocks; but the season as a whole will be busy, though not excessively so, and, for reasons set forth in a former letter, prices for ores will be remunerative, although subject to slight vicissitudes from forced competition.

SPECULAR.

BOILER EXPLOSIONS IN 1882.

The managers of the Hartford Steam Boiler Inspection and Insurance Company have published in the *Locomotive* some very instructive figures relating to boiler explosions during the year 1882. A classified list of the works at which such disasters occurred is as follows:

CLASSIFIED LIST OF BOILER EXPLOSIONS FOR THE YEAR 1882.

Saw-mills and wood-working establishments generally	50
Steamboats, steam-tugs, and steam vessels generally	24
Iron-works, rolling-mills, foundries, machine and boiler-shops	18
Locomotives	14
Portable hoisters and agricultural engines generally	9
Flour-mills and elevators	8
Steam-heating, drying, dwellings, public buildings, ranges, etc	8
Paper-mills, bleaching, digesting, etc	7
Distilleries, breweries, malt and sugar-houses, soap and chemical works	4
Mines, oil-wells, etc	10
Miscellaneous	20
Total for the year	172
Number of persons killed	271
Number of persons injured	369

The list of explosions kept in the office of the Hartford Company does not include every accident that happens to a boiler, but only those that find their way into the papers. The number of these accidents is much larger than it should be, though, when compared with the number of boilers in use in the country, the percentage is small, being only about eleven one hundredths of one per cent of the whole. The summary of the reports of the inspectors of the company is very instructive. It appears that during the year there were 25,742 visits of inspection, an increase of 3330, or nearly 13 per cent, over the number made in 1881. The total number of boilers examined was 55,679, an increase of 8434, or slightly more than 15 per cent more than were examined in 1881. The number of complete internal inspections foots up 21,428, being an increase of 3888, or almost 18 per cent more than were made in the previous year. The hydrostatic test was applied in 4564 cases. The number of boilers condemned was 478. The number of defects reported was 33,690, of which number 6867 were considered dangerous. Appended is a detailed statement of the defects found:

Nature of defects.	Whole number.	Dangerous.
Cases of deposit of sediment	3,138	467
Cases of incrustation and scale	4,913	450
Cases of internal grooving	237	112
Cases of internal corrosion	1,210	232
Cases of external corrosion	1,803	437
Broken and loose braces and stays	613	293
Defective settings	935	158
Furnaces out of shape	1,030	204
Fractured plates	1,801	902
Burned plates	1,084	412
Blistered plates	2,853	385
Cases of defective riveting	4,807	535
Defective heads	386	149
Serious leakage around tubes	3,414	845
Serious leakage at seams	1,957	342
Defective water-gauges	640	146
Defective blow-out apparatus	290	118
Cases of low water	131	84
Safety-valves overloaded	358	136
Safety-valves defective in construction	238	99
Defective pressure-gauges	1,808	344
Boilers without pressure-gauges	43	14
Defective feed-pipe	1	1
Dangerous defect unclassified by inspectors	...	2
Total	33,690	6,867

THE MAXWELL-LYTE PROCESS OF WORKING COMPLEX ORES.

Mr. F. Maxwell-Lyte, of London, England, has proposed a method for the treatment of complex ores and metallic compounds which is worthy of attention, because it utilizes known chemical reactions in quite an ingenious manner. It is well known that there exist in many of the principal mineral countries large bodies, notably of close mixtures of argentiferous galena and blende, or carbonate of lead or galena and calamine, or copper or iron pyrites with blende or galena, often carrying also considerable quantities of antimony. Until quite recently, when the Parnell process is said to be treating these classes of ores, they have resisted economical working either by dressing or smelting, and have been consequently practically worthless. Mr. Maxwell-Lyte describes his process as follows: He begins by calcining the ore so that most of its sulphur is burnt off. A part is oxidized into sulphuric acid, variable quantities of which remain combined with the metallic oxides produced. The gases resulting from this calcination, strongly charged with sulphurous acid, may be utilized for the manufacture of sulphuric acid, or the sulphurous acid may be condensed by means of magnesia milk, and subsequently utilized according to Heinrich Precht's method. There generally remains in the calcined ores from 3 to 5 per cent of sulphur, in one form or another; but this does not interfere with the subsequent treatment of the ore.

When this calcined ore is first finely pulverized and then treated for a certain length of time with hot or boiling hydrochloric acid of from 15 to 17 per cent of hydrochloric acid in proper quantity—that is, the quantity requisite to bring into solution the zinc and other more soluble bases—the zinc and the copper can be for the most part dissolved; and if this solution be now decanted off and cooled, most of the lead and silver remain insoluble, either with the gangue in the attacking-tub, or separate out of the decanted liquor as it cools. (For the most perfect working of the process, the acid should be used in such quantity as to leave an excess of about 5 or 6 per cent of free hydrochloric acid, still in solution, together with the chlorides produced, but some latitude is allowable in this respect.) On adding another like quantity of hydrochloric acid, any part of the lead or silver which may have before escaped attack becomes completely chloridized, and largely dissolved by this second acid, while more or less of the sesquioxide of iron, always present in such ores after calcination, passes into solution as sesquichloride. This sesquichloride of iron seems materially to assist in completing the chlorination of the lead and silver. According, then, to the quantities of lead and silver present in the ore, the whole or part of these metals will have been dissolved by this second acid; but portions of these may, and generally do, remain, mixed with the gangue as chlorides.

If, again, this solution of the chlorides of lead and silver in hydrochloric acid resulting from this second attack be decanted into another vessel containing a fresh charge of calcined ore, it will take up more zinc and copper, and, becoming partially neutralized, most of the lead and silver will again separate and fall down as the liquor cools, so that the clear liquid may be drawn off nearly free from lead or silver.

These operations being completed, the first vessel where the ore was attacked, which for clearness we will call A, will contain a gangue together with more or less lead and silver chlorides, this said gangue being still wet with some of the acid liquor of the second attack containing sesquichloride of iron. The ore, on the other hand, in the second attacking-vessel, which we will call B, will have lost most of its zinc and copper, but will have got added to it some of the lead and silver drawn over from A by the second acid. It is now evident that by boiling the partially saturated acid with the fresh ore in the second vessel B, allowing it to settle, and decanting the liquor off, we can, with the application of a fresh charge of acid, chloridize all the lead and silver in the new batch of ore in B, and by decanting B once more on to a fresh charge of ore placed in A, we can again cause nearly all the lead and silver this acid had taken up to reprecipitate on cooling, and so on *ad infinitum*, always obtaining as residues, on the one hand, the decanted (partially neutralized and cooled) liquors, rich in zinc or copper, but poor in lead or silver; and, on the other hand, gangues wet with acid, and containing the lead and silver completely chloridized. Were these liquors allowed to cool and decanted off quite neutral, they would retain and carry over in actual solution but insignificant traces of lead or silver, and nearly the whole of these metals would remain as chlorides with any gangue that had been mechanically carried over when this had settled. In practice, however, where speed is desirable, it is not convenient to obtain them so, since they have to be decanted while still hot. Some traces, then, of these metals are therefore still carried over in the hot decanted liquors; but these weakly acid zincous and cupreous liquors, when allowed to stand and cool, deposit nearly every trace of the lead and silver chlorides they may have carried over, whether that which may been carried over in suspension or that which may have been taken into actual solution.

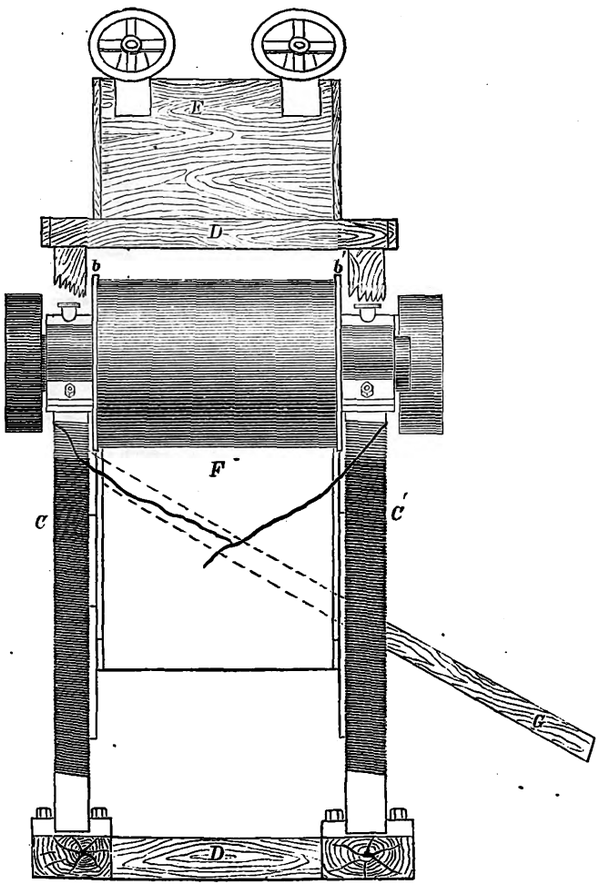
It is worth while here also to observe that it is by no means always necessary to attack the ore with hot acid as above described. If the ore be only properly calcined and then reduced to fine powder, say to a sixty-mesh, there is no real necessity for heating the ore with the acid; the only difference usually being that the attack takes rather longer to become complete; but, on the other hand, there are certain refractory ores that can never be made to yield up the whole of their zinc to cold acid. Where, however, cold acid can be used (and this is easily settled by experiment in the laboratory), it is certainly to be preferred, as involving on the whole less trouble and expense, and if allowed to settle well before decantation, practically speaking no lead or silver chlorides at all are carried over when the zinc liquor is finally drawn off from the second attack.

The acid zinc liquor derived from the attacks of the several batches of ore by the hydrochloric acid contains, as well as zinc and copper chlorides, the chlorides of any other soluble bases the ore may have contained, usually iron, alumina, lime, and often some soluble silica. If this liquor, after being cooled, be simply neutralized with chalk, that is, if chalk be added and stirred up with the liquor till a further addition ceases to cause effervescence, the iron and alumina it contains are for the most part precipitated, only that quantity of iron remaining in solution which the calcined ore may have contained as protoxide or sulphide. If the liquor be now decanted through a filter, this precipitated iron, together with any excess of chalk which may have been added, as well as the silica and alumina present, are retained, while the liquor passes off containing the copper and the zinc. If the work has been carefully conducted, no more than four grains of silver to each cubic foot of zinc liquor should remain in solution, and even this silver, if it be considered worth while, may be collected by some spongy lead reduced by means of spelter from a solution of chloride of lead in brine. The copper and these traces of silver may also be conveniently extracted by immersing bits of spelter or scrap-zinc in the neutralized filtered solution, and, finally, the zinc may be extracted as oxide by heating the solution to boiling, and treating it while boiling with the least possible excess of lime in the form of milk of lime.

Some late experiments have also shown that the small portion of copper sometimes contained in the zinc liquor may be extracted therefrom by the addition of the least possible quantity of milk of chalk, or of milk of lime, and blowing air through the liquor as in the Weldon oxidizer. The addition of a small quantity of solution of bleaching-powder or of lead peroxide seems further to facilitate this separation. The copper in this case becomes separated as an oxychloride, which is often slightly argentiferous, traces of silver going down with it, if any of that metal be present. If bleach solution be employed, manganese, nickel, cobalt, and other metals capable of being thrown down as peroxides may also be found in the precipitate. Some valuable substances occasionally present in small quantities in these mixed ores may be thus recovered.

The actual quantity of hydrochloric acid to be employed in the attack will of course depend in each case on the composition of the ore to be treated. In treating the Welsh bluestone already mentioned, about six and a half or seven of acid of fifteen per cent of hydrochloric acid to one of calcined ore may be used; but the quantity is easily adjustable for each kind of ore by an experiment in the laboratory on a small scale, or the quantity requisite may be calculated on an analysis of the ore. In practice, it is found that, even if double the amount of real hydrochloric acid be employed which would be requisite for attacking and chloridizing the soluble bases (not including the iron the ore may contain), the cold zinc solution obtained will not retain more than mere traces of lead or silver. We thus see how the zinc, and for the most part the copper, may be separated as chloride, and decanted off from the lead and the silver chlorides which are left insoluble in the cooled liquors or with the gangue.

If now a quantity of strong brine (say ten gallons of brine to every four pounds of lead the charge of ore may have contained) be heated to boiling and flushed hot on to the mixture of gangue with the lead and silver chloride and boiled (those chlorides of lead and silver which separated from the zinc solution on cooling being returned to the gangue), the lead and silver are entirely taken into solution; and this brine being allowed to settle and run off as hot as possible into a clean vessel and cooled, will deposit most of its lead as lead chloride, but none of its silver, this latter metal being retained entirely in solution, provided it be not present in larger proportion than about one fiftieth part of the lead, or provided there be at least about one gallon of brine to every seven grains of metallic silver the ore contained. Silver rarely occurs in those mixed ores where it is associated with lead in such quantity that the proportion of brine requisite for the solution of the lead when hot is insufficient to be able to retain in solution all the silver when cold; but if it does, the quantity of brine must of course be increased and apportioned to it so that all the silver may be taken up and retained in solution on cooling.

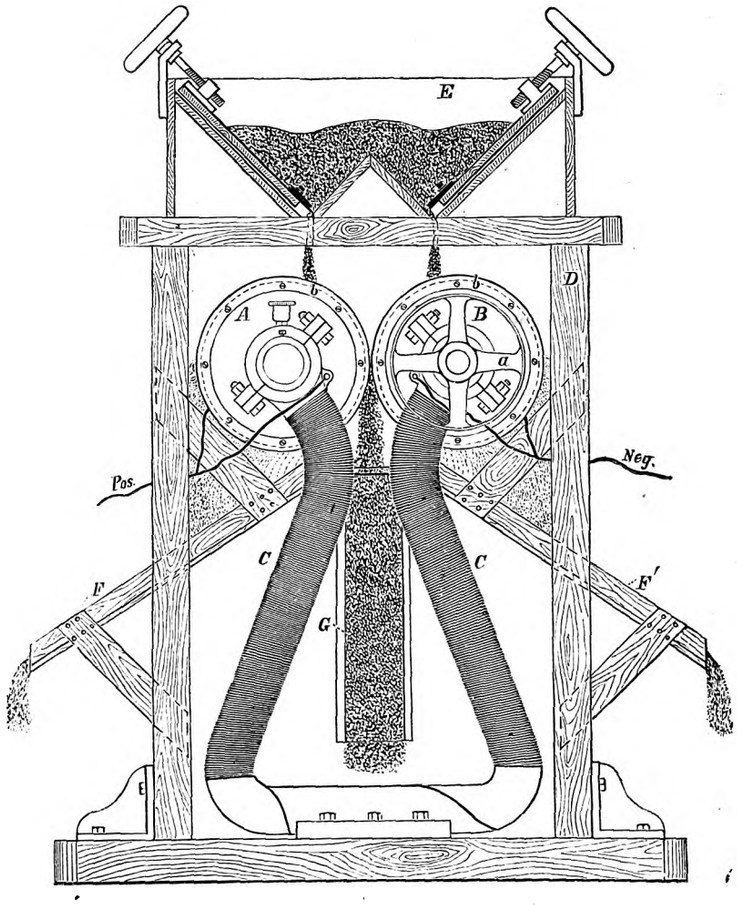


Lead chloride is soluble in a boiling saturated solution of sodium chloride (brine) to the extent of about 53¼ parts (=40 parts of metallic lead) to 1000 parts by measure of boiling brine; whereas, on cooling down to ordinary temperatures, most of it crystallizes out until no more than about 10·8 of lead chloride (= 8 of metallic lead) to 1000 of brine remains in solution. Silver is soluble in the same liquid to the extent of about 1 of silver chloride (= 0·75 parts of metallic silver) to 1000 of brine at from about 10 degrees to 12 degrees C., and about 1·2 of silver chloride to 1000 of brine at from about 25 degrees to 26 degrees C., and about double that quantity at a boiling temperature. The presence of lead chloride in the brine would appear not to diminish this rate of solubility of silver as silver chloride. The solution of silver chloride in brine appears to be peculiarly liable to that condition chemically termed super-saturation, so much so, that it will often be found that hot brine saturated with silver chloride will remain perfectly clear on cooling, until some determining cause, such as the addition of an atom of solid silver chloride, intervenes, when immediately the whole liquid will turn milky from the separation of silver chloride. When lead and silver chlorides then are present together, they are dissolved; and, if care be taken to have brine enough present in proportion to the silver, all the silver is retained in solution on cooling, while most of the lead becomes deposited as lead chloride.

If the cooled brine be now decanted from the precipitated lead chlorid and a piece of metallic zinc be immersed in it, the lead chloride sti remaining in solution and the whole of the silver chloride are reduced, together with formation of spongy metallic lead and silver on the one hand, and zinc chloride which passes into solution on the other. It suffices, however, and is more convenient in practice, to only precipitate part of the lead from the brine, and by leaving this light spongy lead floating about in flocks and agitating the brine with it, this lead gradually picks up all the silver from the brine, till it becomes very argentiferous. Successive charges of argentiferous brine may be run into a tub properly disposed for the purpose with such flocks of spongy lead floating about in it, and the silver may be picked up from each such successive charge, the brine being thus desilverized. This brine then, as it now contains but a fraction of the lead it had taken from the ore, and no silver, may be pumped up, neutralized if necessary, reheated, and used afresh. Thus the same brine may be employed over and over again to withdraw the lead and silver from successive charges of ore, depositing lead chloride in one tub, and all the silver with but a little lead in a third, while, by mere reheating, the same lot of brine becomes repeatedly regenerated in its solvent powers.

The above-mentioned employment of spongy lead is by far the most suitable and convenient in these circumstances, and offers special facilities for the subsequent separation and refining of the silver, being for this reason far superior to iron, copper, or any of the metals the employment of which may have been previously proposed as a means of collecting silver from its solutions. The fact of the silver remaining in the brine together with what lead is still retained in solution after cooling,

Digitized by Google



especially facilitates this mode of its recovery, while it admits of the utilization of the same brine over and over again as a carrier and depositor of the lead on the one hand, and of silver on the other; and, as shown above, by so proportioning the quantity of the brine as to make it sufficient to retain the whole of the silver in solution, this metal can be entirely carried over into a separate tub or vessel, where it may be thrown down completely, the brine being thus freed from silver at each successive operation. The Rozan, Pattinson, or other processes usually employed in desilverizing—or rather, in what should be termed concentrating the silver in lead previous to cupellation—may be dispensed with when this process is employed; for the silver is thus at once obtainable with lead in a sufficiently concentrated form for immediate cupellation. Heating the brine during the desilverizing materially accelerates the operation, a tubful being thus capable of complete desilverization in a few hours. As the brine sometimes contains traces of copper gathered from the ore, it may be found convenient to even rather increase the quantity of lead in the precipitate and to so apportion the lead thrown down as to have enough of that metal present to insure proper cupellation, and further, in order to avoid loss, it is well not to obtain the silver in too concentrated a form. Lead with from 2 to 4 per cent of silver will be rich enough, and indeed ten times as rich as any of the ordinary enriched lead as it usually goes to the cupel. The quantity of lead precipitated is of course proportionate to the time of immersion of the spelter, the quantity of the spelter employed, and the temperature of the brine. Argentiferous precipitates are easily, however, obtainable with 28 or even 30 per cent of silver from ores containing but a few ounces of silver per ton. Instead of spelter, zinc-dust may be used for this precipitation; or, instead of employing spongy lead at all for the collection of the silver, the same end may be obtained by stirring into the argentiferous brine some precipitated lead or copper sulphide. This will also gather the silver from the brine, though not perhaps quite as efficaciously or as rapidly as the spongy lead.

THE BUCHANAN MAGNETIC SEPARATOR.

Among the many recent applications of electricity to the arts, one of the most interesting to those engaged in mining and metallurgy is that of concentrating ores. Though repeatedly attempted, particularly for magnetic iron ores, by the use of permanent magnets, it was not until the perfection of dynamo-electric machines permitted the economical generation of electric currents that any work worthy of serious attention was done. Naturally, the first field in which any effort was made was in the dressing of magnetic iron ores, and sands containing that ore, and in this direction the greatest progress has been made in this country. It may be of interest, however, here, to recall the fact that, at a number of places abroad, magnetic separation has been extended to other classes of ores, notably close mixture of spathic iron ore, or iron pyrites and blende, previously roasted, as it is possible that by this remain similar ores, now useless, may be made available here. The principal field of magnetic separation will, however, always remain the dressing of magnetic iron, sands, and ores. In the case of the former, drying in a suitable revolving cylinder is resorted to, while with the latter class of material a system of c ushing, pulverizing, and sizing is necessary. Mr. C. G. Buchanan, of this city, the inventor of the machine we are about to describe, has shown us a sketch of a mill for this purpose, in which he has, by suitable exhaust arrangements, provided for the removal of the dust made during the crushing and screening, which would prove objectionable in the later separation. The principal market for fine magnetic ore, obtained by this system of dressing, is of course for forge fires and puddling-furnace fix, the quantity which could be used in blast-furnaces being limited by the inconvenience which raw material of such fineness would entail in the working of the furnace.

The Buchanan magnetic separator, which we illustrate this week, has been at work for upward of two years on sands, at Block Island, and possesses features of special interest. *A* and *B* represent the two cast-iron rolls, provided with heavy wrought-iron shafts or journals. In section, these rolls have an oval core, so that the surface of the rolls is uniformly magnetic. The distance between the surface of the two rolls is two inches. *C C* represent the iron standards supporting the rolls, and having journals in which they revolve. The rolls are provided with brass collars *b b'*, intended to prevent the ore from dropping outside of them. *D* represents the wooden frame to which the stands are bolted, and it also supports the hopper *E*, and the chutes *F* and *G*. The standards *C* are first insulated and then closely wound with heavy insulated copper wire, and the two ends of the wire are connected with the poles of a dynamo machine. It is evident that, if a strong current of electricity is passed through the wires, the standards *C* will become powerful electro-magnets, and that, if they are properly wound, each end of the same standard will be of opposite polarity, as indicated by the wires marked Positive and Negative. It is also evident that the rolls will be charged by induction, and that one roll will be of north polarity and the other south. The peculiarity of this arrangement is, that a powerful magnetic field is formed between the rolls, and they are capable, while charged, of holding a weight of 500 or 600 pounds, if it is placed between them, while on their opposite side they are practically non-magnetic, and will not hold a tack.

The variations needed in dressing ores of different grades and sizes are controlled by regulating the power of the current of the dynamo-electric machine. The latter is of a special pattern, producing a current of a low electro-motive force, the wire being heavier and larger electro-magnets being chosen. It is built by the well-known Weston Electric Light Company.

The operation of the machine is as follows: The rolls are rotated toward each other, at a circumference speed of 150 feet per minute, and the hoppers opened so that the ore falls upon the top of the rolls. In passing over the rolls, it is carried through the magnetic field, and all that is magnetic is attracted and attached to the faces of the two rolls, and carried around by them to a point where they lose their magnetic effect, and the ore falls into the chutes *F F*. The rock being acted upon by gravity alone, falls directly into the chute *G*, and a nearly perfect separation is thus effected.

The Union Foundry Company, of Rockaway, N. J., which builds these machines for Mr. C. G. Buchanan, the inventor, manufactures three sizes, the largest having rolls 24 inches in diameter and 36 inches long, with a capacity of treating 100 tons of ore per day, and larger quantities of sand. The range of sizes seems to be considerable. We are informed that ores as fine as from 40 to 60 mesh and as coarse as from 8 to 10 mesh have been treated successfully.

OUR CHEMICAL INDUSTRIES IN THE CENSUS YEAR.

The Census Bureau, in its compendium recently published, gives the statistics of the chemical industry in this country. The total number of establishments in 1880, according to the tables submitted, was 1349, employing 29,520 hands, to whom $11,840,704 were paid in wages. With a total capital of $85,394,211, they manufactured from raw material valued at $77,471,836 products worth $117,377,324. The following are the figures for the leading States :

STATES.	Establishments	Total capital.	Hands employed	Wages paid.	Value of materials.	Value of products.
California	42	$2,406,350	573	$282,614	$2,119,078	$3,179,700
Connecticut	41	1,434,250	549	270,754	1,822,435	2,419,743
Delaware	23	931,379	539	100,026	809,074	1,140,086
Illinois	52	3,348,550	1,463	571,417	5,915,430	7,681,325
Maryland	60	5,578,302	1,380	535,125	4,625,637	7,243,122
Massachusetts	179	6,828,473	2,143	953,784	7,390,703	10,604,662
Missouri	39	3,415,300	1,174	542,769	4,056,274	5,827,493
New Jersey	62	7,371,490	2,655	1,172,654	6,088,296	9,499,577
New York	217	20,141,586	5,249	2,901,960	20,418,018	29,805,614
Ohio	92	5,961,003	1,803	706,434	5,075,395	7,678,374
Pennsylvania	181	18,349,930	4,796	2,151,799	13,085,892	20,884,991
Rhode Island	41	1,291,136	687	274,657	1,169,202	1,968,041
South Carolina	29	3,496,300	2,760	577,100	1,275,115	2,693,053
Virginia	38	645,700	855	125,010	528,675	1,007,166

The products of these establishments are given in the next table, with the amounts of each and their value :

Products.	Quantity.	Value.
Aniline colors	lbs. 80,518	$107,292
Anthracene	" 314,114	99,242
Sulphate ammonia	" 16,575,088	618,485
Alum	" 39,217,725	808,105
Borax	" 3,692,443	277,233
Bromine	" 404,690	114,752
Phosphorus	" 56,292	29,271
Castor oil	galls. 893,802	790,741
Stearic acid candles	lbs. 18,363,066	2,281,600
Oleic acid soap	" 33,058,411	1,707,969
Soap, other hard	" 378,743,627	18,299,350
Soft soaps	" 34,494,100	358,280
Glycerine	" 7,117,825	961,477
Nitro-glycerine	" 3,039,722	1,830,417
Manures, manufactured	tons 727,453	19,921,400
Dry colors	lbs. 67,482,415	4,086,821
White lead	" 123,477,890	8,770,690
Other lead salts	" 11,375,466	758,680
Barytes, ground	tons 19,165	371,829
Zinc, oxide	lbs. 20,121,761	766,337
Acetate lime	" 6,593,000	156,892
Potash and pearlash	" 4,571,671	232,640
Soda	" 40,259,938	866,560
Sulphur	" 1,200,000	21,000
Sulphuric acid	" 308,765,432	3,661,876
Glucose	" 151,740,400	4,551,212
All other products		44,927,101

While the above articles are made in thirty-eight States and territories, not one article of the entire list is made in all of them. Alum is made in only three States ; borax in two, California and Nevada ; bromine in three ; phosphorus only in New Jersey ; oxide of zinc in only four States, Missouri, New Jersey, Ohio, and Pennsylvania ; soda only in Nevada and Pennsylvania ; and sulphur in Nevada only. Pennsylvania leads off in the manufacture of sulphate of ammonia with a product of 4,999,738 pounds ; New York following with 3,870,000 pounds, and Ohio with 2,500,000. Of alum, Pennsylvania furnishes about three quarters of all that is produced in the United States. Of borax, the State of Nevada supplies nearly two thirds ; the remainder comes from California. Seven States produce nitro-glycerine, of which California furnishes 1,242,424 pounds—nearly one half of the total production. In manufactured manures, Maryland takes the lead with a production of 191,571 tons, and although twenty eight States have establishments, none of them produces large quantities. Pennsylvania produces the largest amount of white-lead, 30,540,499 pounds ; then follow New York, with 28,144,009 pounds ; Missouri, with 26,400,324 pounds ; and Ohio, with 13,140,458 pounds. New Jersey produces rather more than three quarters of all the oxide of zinc, or 16,774,756 pounds, while Pennsylvania produces 2,656,600 pounds. New York produces nearly one half of all the acetate of lime, 3,171,544 pounds, and Michigan comes second, with 1,500,000 pounds. In the production of potash and pearlash, Wisconsin takes the lead, with 1,511,181 pounds, closely followed by Michigan, with 1,393,962 pounds, these two States producing nearly three quarters of the entire amount. Of soda, Pennsylvania produces 38,459,938 pounds, and Nevada the remainder, 1,800,000 pounds. Of sulphur, Nevada produces all, 1,200,000. Eighteen States contribute to the supply of sulphuric acid, of which four States furnish over two thirds of the total, New Jersey leading with a production of 74,994,625 pounds ; then follow Pennsylvania, with 66,346,819 pounds ; Maryland, with 43,920,000 pounds ; and New York, with 41,363,543 pounds.

IN the *American Naturalist* for February, 1883, Dr. F. M. Endlich gives an ideal section of the geological formation of the Lake Valley region, New Mexico.

THE number of tons of freight moved over the main line and branches of the Pennsylvania Railroad, including 1,345,700 tons of fuel, and other materials for the company's use, was 21,706,099 tons ; for the previous year, 19,312,227 tons ; showing an increase of 2,393,872 tons, or 12·40 per cent : of this increase, 2,393,744 tons were in local freight, and 128 tons in through freight. Of the 20,360,399 tons of individual freight transported over the main line and branches, 1,944,819 were through, and 18,415,580 local, freight. The coal shipments increased 1,474,616 tons, and the coke shipments, 473,224 tons ; their aggregate being 11,157,146 tons, as against 9,209,306 in 1881—a gain of 1,947,840 tons. The East-bound coke tonnage from the Connellsville region shows an increase of 108,689 tons, and the West-bound an increase of 281,332 tons ; the entire movement from that district amounting to 2,370,050, out of a total of 2,888,787 tons from all sources.

THE NEW TARIFF BILL.

The following are the rates of duty provided for in the new Tariff Bill, which goes into effect on the 1st of July, 1883. We have chosen those in which our readers are likely to be interested, directly or indirectly :

SCHEDULE A—CHEMICAL PRODUCTS.

Phosphorus, ten cents per pound.

Acid, acetic, acetous, or pyroligneous acid, not exceeding the specific gravity of one and forty-seven one thousandths, two cents per pound ; exceeding the specific gravity of one and forty-seven one thousandths, ten cents per pound.

Iodine, resublimed, forty cents per pound.

Soda and potassa, tartrate, or rochelle salt, three cents per pound.

Alumina, alum, patent alum, alum substitute, sulphate of alumina, and aluminous cake and alum in crystals or ground, sixty cents per hundred pounds.

Ammonia, anhydrous, liquefied by pressure, twenty per centum *ad valorem*.

Ammonia aqua, or water of ammonia, twenty per centum *ad valorem*. Muriate, or sal ammoniac, ten per centum *ad valorem*. Carbonate, twenty per centum *ad valorem*. Sulphate, twenty per centum *ad valorem*.

Asbestos, manufactured, twenty-five per centum *ad valorem*.

Baryta, sulphate of, or barytes, unmanufactured, ten per centum *ad valorem*.

Baryta, sulphate of, or barytes, manufactured, one fourth of one cent per pound.

Refined borax, five cents per pound. Pure boracic acid, five cents per pound ; commercial boracic acid, four cents per pound ; borate of lime, three cents per pound ; crude borax, three cents per pound.

Cement, Roman, Portland, and all others, twenty per centum *ad valorem*.

Chromic acid, fifteen per centum *ad valorem*. Chromate of potash, three cents per pound. Bi-chromate of potash, three cents per pound.

Cobalt, oxide of, twenty per centum *ad valorem*.

Copper, sulphate of, or blue vitriol, three cents per pound.

Iron, sulphate of, or copperas, three tenths of one cent per pound.

Acetate of lead, brown, four cents per pound. Acetate of lead, white, six cents per pound. White lead, when dry or in pulp, three cents per pound. When ground, or mixed in oil, three cents per pound. Litharge, three cents per pound. Orange mineral, and red lead, three cents per pound. Nitrate of lead, three cents per pound.

Magnesia, medicinal, carbonate of, five cents per pound ; calcined, ten cents per pound ; sulphate, or Epsom salts, one half of one cent per pound.

Potash, crude, carbonate of, or fused, and caustic potash, twenty per centum *ad valorem*. Chlorate, three cents per pound. Hydriodate, iodide and iodate, fifty cents per pound. Prussiate, red, ten cents per pound. Prussiate, yellow, five cents per pound. Nitrate, or saltpeter, crude, one cent per pound. Nitrate, or refined saltpeter, one and one half cents per pound. Sulphate, twenty per centum *ad valorem*. Soda. Soda ash, one quarter of one cent per pound. Sal or soda crystals, one quarter of one cent per pound. Bi-carbonate, or super-carbonate and salaratus, calcined or pearl ash, one and one half cents per pound. Hydrate or caustic, one cent per pound. Sulphate, known as salt cake, crude or refined, or niter cake, crude or refined and Glauber's salt, twenty per centum *ad valorem*. Silicate or other alkaline silicate, one half of one cent per pound.

Sulphur, refined, in rolls, ten dollars per ton. Sublimed, or flowers of, twenty dollars per ton.

Ocher and ochery earths, umber and umber earths, and sienna and sienna earths, when dry, one half of one cent per pound ; when ground in oil, one and one half cents per pound.

Zinc, oxide of, when dry, one and one fourth cents per pound. Zinc, oxide of, when ground in oil, one and three fourths cents per pound.

All non-dutiable, crude minerals, but which have been advanced in value or condition by refining or grinding, or by other process of manufacture, not specially enumerated or provided for in this act, ten per centum *ad valorem*.

All earth or clays, unwrought or unmanufactured, not specially enumerated or provided for in this act, one dollar and fifty cents per ton.

All earths or clays, wrought or manufactured, not specially enumerated or provided for in this act, three dollars per ton ; china clay, or kaolin, three dollars per ton.

SCHEDULE B—EARTHENWARE AND GLASSWARE.

Brick, fire-brick, and roofing and paving tile, not specially enumerated or provided for in this act, twenty per centum *ad valorem*.

Slates, slate pencils, slate chimney pieces, mantels, slabs for tables, and all other manufactures of slate, thirty per centum *ad valorem*. Roofing slates, twenty-five per centum *ad valorem*.

SCHEDULE C—METALS.

Iron ore, including manganiferous iron ore, also the dross or residuum from burnt pyrites, seventy-five cents per ton. Sulphur ore, as pyrites or sulphuret of iron in its natural state, containing not more than three and one half per centum of copper, seventy-five cents per ton ; *Provided*, That ore containing more than two per centum of copper shall pay, in addition thereto, two and one half cents per pound for the copper contained therein.

Iron in pigs, iron kentledge, spiegeleisen, wrought and cast scrap iron, and scrap steel, three tenths of one cent per pound ; but nothing shall be deemed scrap iron or scrap steel except waste or refuse iron or steel that has been in actual use and is fit only to be re-manufactured.

Iron railroad bars, weighing more than twenty-five pounds to the yard, seven tenths of one cent per pound.

Steel railroad bars and railroad bars made in part of steel, weighing more than twenty-five pounds to the yard, seventeen dollars per ton.

Bar iron, rolled or hammered, comprising flats not less than one inch wide, nor less than three eighths of one inch thick, eight tenths of one cent per pound ; comprising round iron not less than three fourths of one inch in diameter, and square iron not less than three fourths of one inch square, one cent per pound ; comprising flats less than one inch wide, or less than three eighths of one inch thick ; round iron less than three fourths of one inch and not less than seven sixteenths of one inch in diameter, and square iron less than three fourths of one inch square, one and one tenth of one cent per pound ; *Provided*, That all iron in slabs, blooms, loops, or other forms, less finished than iron in bars, and more advanced than pig-iron, except castings, shall be rated as iron in bars, and pay a duty accordingly ; and none of the above iron shall pay a less rate of duty than thirty-five per centum *ad valorem ; Provided further*, That all iron bars, blooms, billets, or sizes or shapes of any kind, in the manufacture of which charcoal is used as fuel, shall be subject to a duty of twenty-two dollars per ton.

Iron or steel tee rails, weighing not over twenty-five pounds to the yard, nine tenths of one cent per pound ; iron or steel flat rails, punched, eight tenths of one cent per pound.

Round iron, in coils or rods, less than seven sixteenths of one inch in diameter, and bars or shapes of rolled iron not specially enumerated or provided for in this act, one and two tenths of one cent per pound.

Boiler, or other plate-iron, sheared or unsheared, skelp iron, sheared or rolled in grooves, one and one fourth cents per pound ; sheet-iron, common or black, thinner than one inch and one half, and not thinner than number twenty wire gauge, one and one tenth of one cent per pound ; thinner than number twenty wire gauge, and not thinner than number twenty-five wire gauge, one and two tenths of one cent per pound ; thinner than number twenty-five wire gauge, and not thinner than number twenty-nine wire gauge, one and five tenths of one cent per pound ; thinner than number twenty-nine wire gauge, and all iron commercially known as common or black taggers' iron, whether put up in boxes or bundles or not, thirty per centum *ad valorem ; And provided*, That on all such iron and steel sheets or plates aforesaid, excepting on what are known commer-

Digitized by Google

cially as tin plates, terne plates, and taggers' tin, and hereafter provided for when galvanized or coated with zinc or spelter or other metals, or any alloy of those metals, three fourths of one cent per pound additional.

Polished, planished, or glanced sheet-iron or sheet-steel, by whatever name designated, two and one half cents per pound; *Provided*, That plate or sheet or taggers' iron, by whatever name designated, other than the polished, planished, or glanced herein provided for, which has been pickled or cleaned by acid, or by any other material or process, and which is cold-rolled, shall pay one quarter cent per pound more duty than the corresponding gauges of common or black sheet or taggers' iron.

Iron or steel sheets, or plates, or taggers' iron, coated with tin or lead, or with a mixture of which these metals is a component part, by the dipping or any other process, and commercially known as tin plates, terne plates, and taggers' tin, one cent per pound; corrugated or crimped sheet-iron or steel, one and four tenths of one cent per pound.

Hoop, or band, or scroll, or other iron, eight inches or less in width and not thinner than number ten wire gauge, one cent per pound; thinner than number ten wire gauge and not thinner than number twenty wire gauge, one and two tenths of one cent per pound; thinner than number twenty wire gauge, one and four tenths of one cent per pound; *Provided*, That all articles not specially enumerated or provided for in this act, whether wholly or partly manufactured, made from sheet, plate, hoop, band, or scroll iron herein provided for, or of which such sheet, plate, hoop, band, or scroll iron shall be the material of chief value, shall pay one fourth of one cent per pound more duty than that imposed on the iron from which they are made, or which shall be such material of chief value.

Iron and steel cotton ties, or hoops for bailing purposes, not thinner than number twenty wire gauge, thirty-five per centum *ad valorem*.

Cast-iron pipe of every description, one cent per pound.

Cast-iron vessels, plates, stove plates, andirons, sad-irons, tailors' irons, hatters' irons, and castings of iron, not specially enumerated or provided for in this act, one and one quarter of one cent per pound.

Cut nails and spikes, of iron or steel, one and one quarter of one cent per pound.

Cut tacks, brads, or sprigs, not exceeding sixteen ounces to the thousand, two and one half cents per thousand; exceeding sixteen ounces to the thousand, three cents per pound.

Iron or steel railroad fish plates, or splice bars, one and one fourth of one cent per pound.

Malleable iron castings, not specially enumerated or provided for in this act, two cents per pound.

Wrought-iron or steel spikes, nuts and washers, and horse, mule, or ox shoes, two cents per pound.

Anvils, anchors or parts thereof, mill-irons and mill-cranks of wrought-iron, and wrought-iron for ships, and forgings of iron and steel for vessels, steam-engines, and locomotives, or parts thereof, weighing each twenty-five pounds or more, two cents per pound.

Iron or steel rivets, bolts, with or without threads or nuts, or bolt blanks, and finished hinges or hinge blanks, two and one half of one cent per pound.

Iron or steel blacksmiths' hammers and sledges, track tools, wedges, and crow-bars, two and one half of one cent per pound.

Iron or steel axles, parts thereof, axle-bars, axle blanks, or forgings for axles, without reference to the stage or state of manufacture, two and one half of one cent per pound.

Forgings of iron and steel, or forged iron, of whatever shape or in whatever stage of manufacture, not specially enumerated or provided for in this act, two and one half cents per pound.

Horseshoe nails, hob-nails, and wire nails, and all other wrought-iron or steel nails, not specially enumerated or provided for in this act, four cents per pound.

Boiler tubes, or flues, or stays of wrought-iron or steel, three cents per pound.

Other wrought-iron or steel tubes, or pipes, two and one-quarter cents per pound.

Chain or chains of all kinds, made of iron or steel, not less than three fourths of one inch in diameter, one and three quarter cents per pound; less than three fourths of one inch and not less than three eighths of one inch in diameter, two cents per pound; less than three eighths of one inch in diameter, two and one half cents per pound.

Cross-cut saws, eight cents per linear foot.

Mill, pit, and drag-saws, not over nine inches wide, ten cents per linear foot; over nine inches wide, fifteen cents per linear foot.

Circular saws, thirty per centum *ad valorem*.

Hand, back, and all other saws, not specially enumerated or provided for in this act, forty per centum *ad valorem*.

Files, file blanks, rasps, and floats of all cuts and kinds, four inches in length and under, thirty-five cents per dozen; over four inches in length and under nine inches, seventy-five cents per dozen; nine inches in length and under fourteen inches, one dollar and fifty cents per dozen; fourteen inches in length and over, two dollars and fifty cents per dozen.

Steel ingots, cogged ingots, blooms, and slabs, by whatever process made; die blocks or blanks; billets and bars, and tapered or beveled bars; bands, hoops, strips, and sheets of all gauges and widths; plates of all thicknesses and widths; steamer, crank, and other shafts; wrist or crank-pins; connecting-rods and piston-rods, pressed, sheared or stamped shapes, or blanks of sheet or plate-steel, or combination of steel and iron, punched or not punched; hammer molds or swaged steel; gun molds not in bars; alloys used as substitutes for steel tools; all descriptions and shapes of dry sand, loam, or iron molded steel castings; all of the above classes of steel not otherwise specially provided for in this act, valued at four cents a pound or less, forty-five per centum *ad valorem*; above four cents a pound and not above seven cents per pound, two cents per pound; valued above seven cents and not above ten cents per pound, two and three fourth cents per pound; valued at above ten cents per pound, three and one fourth cents per pound.

Provided, That on all iron or steel bars, rods, strips or steel sheets, of whatever shape, and on all iron or steel bars of irregular shape or section, cold-rolled, cold-hammered, or polished in any way in addition to the ordinary process of hot-rolling or hammering, there shall be paid one fourth cent per pound in addition to the rates provided in this act, and on steel circular saw-plates there shall be paid one cent per pound in addition to the rate provided for in this act.

Iron or steel beams, girders, joists, angles, channels, car-truck channels, T T, columns and posts, or parts or sections of columns and posts, deck and bulb beams, and building forms, together with all other structural shapes of iron or steel, one and one fourth of one cent per pound.

Steel wheels and steel-tired wheels for railroad purposes, whether wholly or partly finished, and iron or steel locomotive, car, and other railroad tires, or parts thereof, wholly or partly manufactured, two and one half of one cent per pound; iron or steel ingots, cogged ingots, blooms, or blanks for the same, without regard to the degree of manufacture, two cents per pound.

Iron or steel rivet, screw, nail, and fence wire rods, round, in coils and loops, not lighter than number five wire gauge, valued at three and one half cents or less per pound, six tenths of one cent per pound. Iron or steel, flat, with longitudinal ribs for the manufacture of fencing, six tenths of a cent per pound.

Screws, commonly called wood screws, two inches or over in length, six cents per pound; one inch and less than two inches in length, eight cents per pound; over one half inch and less than one inch in length, ten cents per pound; one half inch and less in length, twelve cents per pound.

Iron or steel wire, smaller than number five and not smaller than number ten wire gauge, one and one half cents per pound; smaller than number ten and not smaller than number sixteen wire gauge, two cents per pound; smaller than number sixteen and not smaller than number twenty-six wire gauge, two and one half cents per pound; smaller than number twenty-six wire gauge, three cents per pound.

Provided, That iron or steel wire covered with cotton, silk, or other material, and wire commonly known as crinoline, corset, and hat wire, shall pay four cents per pound in addition to the foregoing rates; *And provided further*, That no article made from iron or steel wire, or of which iron or steel wire is a component part of chief value, shall pay a less rate of duty than the iron or steel wire from which it is made either wholly or in part; *And provided further*, That iron or steel wire cloths, and iron or steel wire nettings, made in meshes of any form, shall pay a duty equal in amount to that imposed on iron or steel wire of the same gauge, and two cents per pound in addition thereto. There shall be paid on galvanized iron or steel wire (except fence wire) one half of one cent per pound in addition to the rate imposed on the wire of which it is made. On iron wire rope and wire strand, one cent per pound in addition to the rates imposed on the wire of which it is made. On steel wire rope and wire strand, two cents per pound in addition to the rates imposed on the wire of which it is made.

Steel not specially enumerated or provided for in this act, forty-five per cent *ad valorem*.

Provided, That all metal produced from iron or its ores, which is cast and malleable, of whatever description or form, without regard to the percentage of carbon contained therein, whether produced by cementation, or converted, cast, or made from iron or its ores, by the crucible, Bessemer, pneumatic, Thomas-Gilchrist, basic, Siemens-Martin, or open-hearth process, or by the equivalent of either, or by the combination of two or more of the processes, or their equivalents, or by any fusion or other process which produces from iron or its ores a metal either granular or fibrous in structure, which is cast and malleable, excepting what is known as malleable iron castings, shall be classed and denominated as steel.

No allowance or reduction of duties for partial loss or damage in consequence of rust or of discoloration shall be made upon any description of iron or steel, or upon any partly manufactured article of iron or steel, or upon any manufacture of iron and steel.

Argentine, albata, or German silver, unmanufactured, twenty-five per centum *ad valorem*

Copper, imported in the form of ores, two and one half cents on each pound of fine copper contained therein; regulus of and black or coarse copper, and copper cement, three and one half cents on each pound of fine copper contained therein; old copper, fit only for remanufacture, clippings from new copper, and all composition metal of which copper is a component material of chief value not specially enumerated or provided for in this act, three cents per pound: copper in plates, bars, ingots, Chili or other pigs, and in other forms, not manufactured, or enumerated in this act, four cents per pound; in rolled plates, called brazier's copper, sheets, rods, pipes, and copper bottoms, and all manufactures of copper, or of which copper shall be a component of chief value, not specially enumerated or provided for in this act, thirty-five per cent *ad valorem*.

Brass, in bars or pig, old brass, and clippings from brass or Dutch metal, one and one half cents per pound.

Lead ore, and lead dross, one and one half cents per pound.

Lead, in pigs and bars, molten, and old refuse lead run into blocks and bars, and old scrap lead, fit only to be remanufactured, two cents per pound.

Lead, in sheets, pipes, or shot, three cents per pound.

Nickel, in ore, matte, or other crude form not ready for consumption in the arts, fifteen cents per pound on the nickel contained therein.

Nickel, nickel oxide, alloy of any kind in which nickel is the element of chief value, fifteen cents per pound.

Zinc, spelter, or tutenag, in blocks or pigs, and old worn-out zinc, fit only to be remanufactured, one and one half cents per pound; zinc, spelter, or tutenag in sheets, two and one half cents per pound.

Sheathing, or yellow metal, not wholly of copper, nor wholly nor in part of iron, ungalvanized, in sheets, forty-eight inches long and fourteen inches wide, and weighing from fourteen to thirty-four ounces per square foot, thirty-five per centum *ad valorem*.

Antimony, as regulus or metal, ten per centum *ad valorem*.

Steel plates, engraved, stereotype plates, and new types, twenty-five per centum *ad valorem*.

Quicksilver, ten per centum *ad valorem*.

Chromate of iron, or chromic ore, fifteen per centum *ad valorem*.

Mineral substances in a crude state, and metals unwrought, not specially enumerated or provided for in this act, twenty per centum *ad valorem*.

Manufactures, articles or wares, not specially enumerated or provided for in this act, composed wholly or in part of iron, steel, copper, lead, nickel, pewter, tin, zinc, gold, silver, platinum, or any other metal, and whether partly or wholly manufactured, forty-five per centum *ad valorem*.

SCHEDULE N—SUNDRIES.

Burr-stones, manufactured or bound up into mill-stones, twenty per centum *ad valorem*.

Candles and tapers of all kinds, twenty per centum *ad valorem*.

Coal-slack or culm, such as will pass through a half-inch screen, thirty cents per ton of twenty-eight bushels, eighty pounds to the bushel.

Coal, bituminous, and shale, seventy-five cents per ton of twenty-eight bushels, eighty pounds to the bushel. A drawback of seventy-five cents per ton shall be allowed on all bituminous coal imported into the United States which is afterward used for fuel on board of vessels propelled by steam which are engaged in the coasting trade of the United States, or in the trade with foreign countries, to be allowed and paid under such regulations as the Secretary of the Treasury shall prescribe.

Coke, twenty per centum *ad valorem*.

Fulminates, fulminating powders, and all like articles, not specially enumerated or provided for in this act, thirty per centum *ad valorem*.

Grindstones, finished or unfinished, one dollar and seventy-five cents per ton.

Gunpowder, and all explosive substances used for mining, blasting, artillery, or sporting purposes, when valued at twenty cents or less per pound, six cents per pound; valued above twenty cents per pound, ten cents per pound.

Gun-wads, of all descriptions, thirty-five per centum *ad valorem*.

Lime, ten per centum *ad valorem*.

Marble of all kinds, in block, rough or squared, sixty-five cents per cubic foot; veined marble, sawed, dressed, or otherwise, including marble slabs and marble paving tiles, one dollar and ten cents per cubic foot.

All manufactures of marble not especially enumerated or provided for in this act, fifty per centum *ad valorem*.

Percussion-caps, forty per centum *ad valorem*.

Philosophical apparatus and instruments, thirty-five per centum *ad valorem*.

Salt, in bags, sacks, barrels, or other packages, twelve cents per one hundred pounds; in bulk, eight cents per one hundred pounds; *Provided*, That exporters of meats, whether packed or smoked, which have been cured in the United States with imported salt, shall, upon satisfactory proof, under such regulations as the Secretary of the Treasury shall prescribe, that such meats have been cured with imported salt, have refunded to them from the treasury the duties paid on the salt so used in curing such exported meats, in amounts not less than one hundred dollars; *And provided further*, That imported salt in bond may be used in curing fish taken by vessels licensed to engage in the fisheries, and in curing fish on the shores of the navigable waters of the United States, under such regulations as the Secretary of the Treasury shall prescribe; and upon proof that the salt has been used for either of the purposes stated in this proviso, the duties on the same shall be remitted.

Stones, unmanufactured or undressed, freestone, granite, sandstone, and all

Digitized by Google

building or monumental stone, except marble, not specially enumerated or provided for in this act, one dollar per ton; and upon stones as above, hewn, dressed, or polished, twenty per centum *ad valorem*.

THE FREE LIST.

CHEMICALS.

SEC. 2503. The following articles, when imported, shall be exempt from duty:

Bones, crude, not manufactured, burned, calcined, ground, or steamed. Bone-dust and bone-ash for manufacture of phosphate and fertilizers. Argal, or argol, or crude tartar. Iodine, crude. Vegetable and mineral wax. Acids used for medicinal, chemical, or manufacturing purposes, not specially enumerated or provided for in this act. Agates, unmanufactured. Apatite. Asbestos, unmanufactured. Arsenic. Antimony ore, crude sulphide of. Arsenic, sulphide of, or orpiment. Baryta, carbonate or witherite. Bauxite. Bromine. Cadmium. Calamine. Chalk and cliff-stone, unmanufactured. Feldspar. Cryolite or kryolith. Iridium. Kieserite. Kyanite or cyanite, and kainite. Lime, chloride of, or bleaching powder. Magnesium. Magnesite, or native mineral carbonate of magnesia. Manganese, oxide and ore of. Osmium. Palladium. Phosphates, crude or native, for fertilizing purposes. Potash, muriate of. Soda, nitrate of, or cubic nitrate. Strontia, oxide of, and proto-oxide of strontian, and strontianite, or mineral carbonate of strontia. Sulphur, or brimstone, not specially enumerated or provided for in this act. Uranium, oxide of, verdigris or subacetate of copper.

Crude minerals, not advanced in value or condition by refining or grinding, or by other process of manufacture, not specially enumerated or provided for in this act.

SUNDRIES.

Aluminium. Asphaltum and bitumen, crude. Bismuth. Bullion, gold and silver. Burr-stone, in blocks, rough or unmanufactured, and not bound up in mill-stones. Coal, anthracite. Coal stores of American vessels, but none shall be unloaded. Cobalt, ore of. Copper, old, taken from the bottom of American vessels, compelled by marine disaster to repair in foreign ports. Copper, when imported for the United States Mint. Diamonds, rough or uncut, including glaziers' diamonds. Diamond-dust or bort. Emery ore. Stones and whetstones. Mica and mica waste. Ores of gold and silver. Pewter and britannia metal, old, and fit only to be remanufactured. Platina unmanufactured. Platinum, unmanufactured, and vases, retorts, and other apparatus, vessels and parts thereof, for chemical uses. Plumbago. Sodium. Sweepings of gold and silver. Tin ore, bars, blocks or pigs, grains or granulated.

FURNACE, MILL, AND FACTORY.

Furnace No. 1, at Sheridan, Pa., was compelled to suspend operations on Wednesday, by the falling in of a portion of the lining. The work of cleaning out is in progress. The break will involve considerable loss of time and a heavy expense.

The sheet and plate mill in course of erection at the Republic Iron-Works, Pittsburg, will be completed and in operation about the middle of April. All kinds of plate and galvanized sheet-iron will be manufactured, a large galvanizing works now being in the course of erection. The knobbling department of the new mill will probably start up this week.

The annual meeting of the stockholders of the Billings & Spencer Company was held at the company's office in Hartford, on the 19th ult. The old board of directors was unaminously re-elected, as follows: Messrs. C. E. Billings, W. A. Healy, L. A. Barbour, C. M. Spencer, L. H. Holt, Silas Chapman, Jr., and E. H. Stocker. At a subsequent meeting of the directors, the old officers were elected, as follows: C. E. Billings, President and Superintendent; L. H. Holt, Treasurer; E. H. Stocker, Secretary. The business for the past year was the largest in the history of the company.

The capacity of the Henry Clay furnace, at Reading, Pa., has been increased from 150 to 200 tons, by raising the furnace twelve feet. It was blown in Tuesday of last week.

Spang, Chalfant & Co. and Graff, Bennett & Co. are drilling a new well in Butler County, to supply their mills with gas. This, we understand, is the sixth well these firms have put down.

The partnership heretofore entered into between H. M. Rolfe, W. S. Bissell, Uri Haskins, and D. S. Bissell, under the name and style of Steel Nail and Spike Company, Limited, having been dissolved by the death of H. E. Rolfe, the business of said partnership will be settled by D. S. Bissell. This is the company formed some time ago for the purpose of manufacturing steel nails and railroad spikes, at a works to be erected by the company in the vicinity of McKeesport.

The Alton Rolling-Mill Company, Alton, Ill., has been incorporated; capital stock, $25,000. The incorporators are James T. Drummond, Charles H. Randal, James W. Kerr, John Haynod, Frederick W. Drury, and W. Pierce.

The Excelsior Iron-Works, of Chicago, are building for the Western Mining Company, Philadelphia, a complete galena plant, consisting of an engine, blower, crusher, a Pacific water-jacket, galena smelter, and other machinery, to be put in operation at Sheridan, Montana. They are also building two 150 horse-power boilers for the Inter-State Industrial Exposition of Chicago.

A bill has been filed against Herbert C. Ayer and a number of railroad companies by the Otis Iron and Steel Company, of Cleveland, to prevent them from paying over any moneys to Ayer or the Union National Bank. Ayer acted as the Otis Company's agent, receiving a commission on his sales; but he has made no remittance since January 31st, and is now owing them $43,000, less the commission for the steel sold by him. It is alleged that Ayer attempted to transfer these accounts to the Union National Bank, and complainant asks for an injunction to prevent defendants from paying, or the banks or Ayer from collecting, such claims. A similar bill has been filed by the Standard Steel Company, of Lewiston, Pa., against Ayer and a number of railroad companies, the amount claimed being $1400.

The John Scott medal "To the Most Deserving," has just been awarded to the Pratt & Whitney Company, of Hartford, by the city of Philadelphia, on the recommendation of the Franklin Institute. The medal was given for the "standard gauges, taps, and dies" of the company. The quality of exact tools made by this company is not surpassed by those of any other manufacturer at home or abroad.

The Taper Sleeve Pulley-Works is a new enterprise at Dubuque, Ia. The works are not yet fairly in operation, the company having started about the 1st of December last.

Robert Wetherill & Co., Chester, Pa., are building a compound Corliss pumping-engine, with a capacity of 2,500,000 gallons per day, for the Gloucester water-works.

The St. Louis Wire Mill Company will shortly begin the erection of a 100 × 30-foot building, to be used, when completed, as a warehouse. A part of the present warehouse will be converted into a galvanizing department. The works are running full on single turn.

Soft steel for agricultural implements is to be made at the South Chicago Steel-Works, experiments to produce a steel that can be welded having been made recently.

The Pennsylvania Iron-Works, Coatesville, have reduced puddlers' wages from $4.25 to $3.75.

The Weimer Machine-Works Company, Lebanon, Pa., is building two 7×4-inch engines for the Citico furnace, Chattanooga, and a 5×4-inch engine for the new blast-furnace erecting at the Texas penitentiary, at Huntsville. The company is also putting up two of its 7×4-inch blowing-engines for the Crozier Iron and Steel Company, Roanoke, Va., and has lately shipped a 7×4-inch engine to the Eureka Company, Oxmoor, Ala., and a 5×5-inch blowing-engine to be used to blow the spiegel furnaces of the Passaic Zinc Company, at Jersey City, N. J.

The Lake Superior and the Jackson iron companies, of Michigan, filed bills of equity in the United States Court on the 6th of March against Brown, Bonnell & Co., of Youngstown, O., alleging that the defendants are indebted to the plaintiffs on promissory notes for $13,714 and $14,700 respectively, and, as the defendants are insolvent, they ask, in behalf of themselves and other creditors, that the court appoint a receiver.

Stockholders of the New England Pressed-Brick Company, of Boston, have applied for the appointment of a receiver to wind up its affairs. The liabilities are reported to be about $60,000. It is said that the company lost about $1.50 a thousand on all the bricks manufactured.

In five days, in eleven nine-hour shifts, the wire-rod mill of the Cleveland Rolling-Mill Company produced 775,505 pounds of steel wire rods, making 16,300 pounds of scrap at the same time.

The Swamscot Machine Company, South Newmarket, N. H., is building one of its improved Swamscot automatic cut-off steam-engines, of 225 horse-power, for Dempsey's new bleachery at Pawtucket, R. I.

The Vulcan Forge Iron-Works, at Pittsburg, were partially destroyed by fire on the 4th. Loss, $35,000, fully covered by insurance.

The Ashland Furnace, Kentucky, made in one week 426½ tons of iron, using raw coal only.

The articles of association of the Hartman Steel Company, Limited, have been filed for record in the recorder's office of Alleghany County, Pa. The capital stock of the partnership is $300,000, and is held in the amounts named by the following persons: Andrew Carnegie, of New York, $112,500; Henry Phipps, Jr., of Pittsburg, $36,000; John Walker, of Pittsburg, $1500; Henry W. Hartman, of Beaver Falls, $25,000; Isaac L. Ellwood, of Chicago, $75,000; Aaron K. Stiles, of Chicago, $15,000; John W. Calkins, of Chicago, $15,000; Reuben E. Seares, of Marshalltown, Iowa, $20,000. This is the Beaver Falls enterprise already referred to repeatedly.

The rolling-mill of Potts Brothers, at Pottstown, Pa., which has been stopped for five weeks past on account of uncertainty about the tariff, was started on the 5th; but after one heat, the puddlers and their helpers refused to work and went home. The cause of the strike was a notice of a reduction to $3.50 a ton for puddlers and of 8 per cent in the wages of the other workmen.

The *Brick, Tile, and Metal Review* publishes the following furnace statistics: There were erected in Pittsburg, during the year 1882, 15 Siemens gas-heating furnaces for heating iron; 3 Siemens gas-heating furnaces for heating steel; 2 Siemens open-hearth furnaces for making steel; 14 gas-heating furnaces for welding steel; 5 gas-heating furnaces for heating iron; 5 gas double puddling-furnaces; 20 steel heating furnaces for tempering steel; 51 open-hearth furnaces rebuilt; 104 crucible steel melting furnaces rebuilt, with a capacity of 3096 pots; 3 crucible kilns, with a capacity of 1000 crucibles per heat (taking one week to make a heat); 120 gas-producers to supply the gas-furnaces, and 30 pot steel melting furnaces. To build the above enumerated furnaces, with their accompanying gas canals for conveying the gas from the producers to the furnaces, smoke-stacks, foundations, etc., required the use of 9,140,000 brick and 2280 tons of iron, representing a total cost of $452,000. The brick used in the above enumerated work is simply enormous. It represents 2,000,000 more brick than can be produced in the largest fire-brick work in the United States in a whole year.

GENERAL MINING NEWS.

ARIZONA.

TOTAL WRECK.—A correspondent writes us that work at the Total Wreck mine, at Pantano, was started on February 13th, with ten stamps crushing ore, and that on February 20th ten more stamps were started. They crush from 65 to 75 tons of ore per day, averaging from $85 to $95 per ton, with average tailings of from $8 to $9. The following telegram was received yesterday from the superintendent: Shipped 20 bars silver; value, $40,000. The body of ore is widening; has appearance of fine body of ore. Average width of ledge is 25 feet. Superintendent James, of the Contention mine, has stated that in his opinion there was at least a year and a half's supply of ore in sight. The company expects

Digitized by Google

soon to commence the payment of dividends and to continue them for an indefinite period.

COCHISE COUNTY—TOMBSTONE DISTRICT.

The latest dispatches state that the Bunker Hill Company has bought the Randolph mill, and is working Rattlesnake and Mammoth ore.

Work on the Head Center mine was resumed yesterday.

The grading for the smelter on the San Diego mine has been completed.

The Sulphuret pumps have been started up and are working successfully.

The case of the Tombstone Mill and Mining Company against the Way Up Company has been argued in the Supreme Court, and has been taken under advisement.

The case of Bidwell against Gird for one half of the Tombstone Company mines has been decided in favor of Gird in the District Court at San Bernardino.

PIMA COUNTY.

AJO.—The first car-load of ore from this copper mine, located a little over one hundred miles from Tucson, has been produced. With present rates of shipment, these mines will be made to pay for their own development.

CALIFORNIA.

MONO COUNTY—BODIE DISTRICT.

A strike of very rich silver ore has been made in the Northern and Southern Light mines, Sweetwater Mountains.

BODIE CONSOLIDATED.—During the past week, 139 tons of ore were crushed; average assay value, $82 per ton. The east cross-cut, 1000 level, is in 295 feet. The north drift, 800 level, is 252 feet long. The mill is running steadily on ore from the 780 level and the levels above.

BODIE TUNNEL.—The mill crushes about 50 tons of ore daily; average pulp-assays, $15.50 per ton.

STANDARD CONSOLIDATED.—During the past week, 1363 tons of ore were crushed. The main east cross-cut, 1000 level, is 1230 feet long; and the east cross-cut from south drift, same level, is 315 feet long, showing quartz seams. The workings on the upper levels continue to show large quantities of ore.

CLOVER PATCH DISTRICT.

WILD ROSE.—According to the Candelaria *True Fissure*, this mine is developed by a tunnel 260 feet in length, by a shaft and drift running north and south, following the ledge. The north drift is in a distance of 125 feet, and some very fine ore is taken from the face. The drift to the south has been run but 30 feet, having been started for the purpose of prospecting the ledge in that direction. The formation in the face is favorable, yet no ore has been encountered of high enough grade. An uprise was started to connect the tunnel level with the shaft above, the shaft having been sunk meanwhile, and the connection made afforded ample and very desirable ventilation. While this work was progressing, a very fine streak of ore was uncovered at a point 46 feet above the tunnel level. It has been followed a distance of 60 feet to the north, and in this was made a development that insures the future success of the mine. It consists of a ledge of ore from two to four feet in width, that carries free gold in considerable quantities. The drift to the south on this level is some forty feet in length, and from it is extracted some excellent ore. A chute has been made from the upper to the tunnel level, and by means of this all the ore is run into cars and conveyed by them to the ore-dump. At present, the old Diana mill, at Benton, is used for crushing the ore, which has to be hauled about eight miles. The mill is kept busy on the output of this mine alone. All the ore is mixed together, and is found to mill about $100 per ton, running some $70 per ton in gold and $30 in silver. The ore is of a character which is easily crushed; that from the north drift on the upper level pulverizes almost to the consistency of coarse sand when it is taken from the ledge. A new mill is to be built early in the spring.

CANADA.

BRITISH COLUMBIA.

A report from Victoria says that a prospector who has just returned from the Kootenay District, brings a specimen of lead and silver ore. He says the mines are extensive. These mines are within sixty miles of the route selected by the Canadian Pacific Railroad, via Kicking Horse Pass.

COLORADO.

ARAPAHOE COUNTY.

BOSTON & COLORADO.—These works produced $402,000 worth of bullion in gold, silver, and copper during February.

BOULDER COUNTY.

LONDON.—A strike is reported to have been made at a depth of twenty-five feet.

CLEAR CREEK COUNTY.

DIAMOND TUNNEL GOLD AND SILVER MINING COMPANY.—It is proposed to erect a mill at Silver Plume for the treatment of the large amount of concentrating ore which this property is capable of producing. The company will either purchase the old Silver Plume mill or build another somewhere along the creek.

DONALDSON.—The company has a strong force of men at work on its new mill and concentration-works, which it is erecting on Clear Creek, below the mouth of Fall River. It is also putting up a wire tramway from the mines to the mill and concentration-works.

SPRINGFIELD.—The company has bought the Silver Queen mine, situated on Seaton Mountain, for $15,000.

VICTORIA TUNNEL.—A contract has been let to run this tunnel 1050 feet from present breast, which is now thirty feet under cover. They will intersect the celebrated Mendota lode in about 800 feet, and estimate that it will take them fourteen months to reach this point and five or six months more to complete the contract. The contractors are putting up a full plant of air-drills, and the motive power will be steam.

CUSTER COUNTY.

BASSICK.—It is reported that a suit has been begun in the United States Court in Colorado by one Joseph L. Phillips against this company, to recover $2,000,000, which Phillips claims has been extracted from his two claims that adjoin the Bassick.

GILPIN COUNTY.

Several of the gulch miners below Black Hawk are preparing to resume placer mining as early as possible in the spring. Dams have been constructed, ditches repaired, and other necessary preparations made for an active season's work.

CALIFORNIA.—This company has added a portion of the Hidden Treasure mill to its stamping capacity, and the California mine on Quartz Hill, operated by it, shows as favorable prospects as at any former period in its history.

UNITED GREGORY.—This company has lowered the water in No. 2 or the pump-shaft, on the Gregory lode, to a point 665 feet below the surface. This is the first time in seven weeks that the water has been lowered to that point. The pump, since being rearranged and remodeled, is working splendidly, and no fears are entertained of any mishap occurring again through defective portions of the pump—Cornish pattern—one of the largest in use in the State of Colorado.

HINSDALE COUNTY.

BONANZA.—The tunnel is in 1480 feet, or 480 feet beyond the cross-cut of the Norris vein.

LITTLE DORA.—Three assays recently made in Chicago, on ore taken from the shaft at a depth of 20 feet, show as follows: No. 1, 1573 ounces silver and 304 ounces of gold; No. 2, 1280 ounces silver and 281 ounces gold; No. 3, 1871 ounces silver and a trace of gold. Extensive developments will be made at the mine this season, and as many men as possible will be put to work upon the shaft, drift, and tunnel, and the rich ore stoped out preparatory to large shipments when roads and other necessary additions are made.

LAKE COUNTY.

Late Leadville exchanges contain the following:

AMIE.—Shipments continue to be made, although the ore is somewhat lower grade than formerly.

BIG PITTSBURG.—Work has been resumed on the Lent shaft.

CATALPA.—The annual report of 1882 shows that the total receipts from silver, iron, and interest account were $95,450.23, and the expenditures $58,332.45, leaving $37,117.78 as the net profit. A dividend of $30,000 was paid, and the balance of $7117.78 was added to the company's surplus, which now amounts to $62,279.23, or more than enough to pay two more dividends. During the year, 5202 tons and 415 pounds of silver ore and 2176 tons and 168 pounds of iron ore were mined.

DINERO.—The shaft is down about 175 feet, and four levels have been run on the vein, the ore produced from this development-work having more than paid the expenses of working the property and making surface improvements. Ore is shipped to the Shields mill.

IRON HILL CONSOLIDATED.—This company has filed papers with the Secretary of State announcing that its capital stock has been increased from $500,000 to $2,500,000, and that its principal office will be at Chicago.

LITTLE SILVER.—About forty men are employed on development-work. No stoping is done, the shipments being confined to the product from development, and the output from that source more than paying the running expenses.

MORNING AND EVENING STAR.—Manager Ward has purchased a five-stamp mill in Denver recently, which is now erecting near the Cummings & Finn smelter. It will be used in the experiments in concentration which Mr. Ward is now making in connection with the low-grade ores of the mines under his management.

ONLY CHANCE.—An important strike is reported to have been made in this lode, located at the head of Georgia Gulch, adjoining Coon Valley. Some ore has been found for some time, but not in profitable quantity, until the present ore-body, which is reported to show a face of six feet of excellent ore, was developed. The strike was made in a drift from the shaft at a depth of over three hundred feet. Shipments will be made.

SUMMIT COUNTY.

GRAY EAGLE.—No work has been done on this mine for some time. It is stated that the lessees have made arrangements to resume operations shortly, and the original plan will then be carried out. The property shows favorable prospects.

ROBINSON CONSOLIDATED.—At a meeting of the stockholders, held in New York recently, the following gentlemen were elected directors for the ensuing year: Hiram A. Johnson, Thomas I. Richman, S. Ayres, Jr., John C. Marron, Charles W. Arthur, S. H. Millard, and S. H. Parsons. The new board then held a meeting and elected Hiram A. Johnson President; John C. Marron, Vice-President; James K. Selleck, Secretary; and Charles B. Selleck, Assistant-Secretary.

DAKOTA.

BLUE LEAD.—Work has been started at the mine, and it is expected that a thirty-ton smelter will be erected.

CALEDONIA.—The superintendent reports, for the week ended February 18th: Ore produced, 1025 tons. Bullion shipped, 457½ ounces; value, $8000. As the south leader is in fair milling ore, we have discontinued running it, and have started stopes. The lower winze has advanced 4½ feet; total, 25½ feet. Upper winze advanced 16 feet; total, 25 feet. Both winzes are in good ore. Machinery at both mill and mine is running well.

FATHER DE SMET.—The report of the superintendent from February 15th to February 22d shows ore extracted from first, second, and third levels, 1975 tons. Ore milled, 1975 tons. Third level header advanced 8 feet. Header in 142 feet. North end tunnel advanced 5 feet. Tunnel in 820 feet. Italian winze advanced 7 feet. Winze down 60 feet. Stopped.

GOLDEN SUMMIT.—Work upon the mine and mill is progressing favorably.

GEORGIA.

CALHOUN.—Is running to its full capacity.

GARNET.—This company recently purchased a considerable tract of mining property in White County, on the Chestatee River. The mine is supposed to be of great value. Considerable improvements have been made. The body consists of some thirty-five lots, taking in several of the auriferous leads which traverse this and adjoining counties. The ore is to be crushed by a 40-stamp water-power mill.

IDAHO.

A very remarkable discovery is reported of a vein of platinum. It is located up a gulch on Wood River, not far from Hailey.

A correspondent of the Salt Lake *Tribune* writes from Senate Hill, Wood River: In this vicinity, the ores are chiefly argentiferous galena, sulphurets, carbonates, etc. On Senate Hill, several mines are opened. Among the most important are the following: More work has been done on the Senate mine than any other. It has a shaft sunk 240 feet, and a tunnel in 140 feet. The ledge is 18 feet wide, and looks well.

The Red Cloud is opened by a shaft about 75 feet deep and a tunnel, and a good quantity of ore is exposed at the bottom of the shaft. Large quantities of good ore were taken from this mine and the Senate last season, and they will be worked extensively this season.

The Conway Castle Company expects to commence improving its property and working its mines as soon as the weather is suitable.

The Modoc is a very large ledge, from 20 to 30 feet wide at the opening. The ore is argentiferous galena and carbonate. It has well-defined walls, and promises to be one of the largest and best mines on Senate Hill. It is well located, and can be easily and cheaply worked. But little work has yet been done (a cut run across the ledge some 25 feet and twenty or thirty tons of ore taken out). Its owners expect to begin work on it soon, and will prosecute the work with all possible energy.

The Occident is a very promising mine. It has an open cut on the ledge about 60 feet long and 15 feet deep.

There are several fine prospects extending south from this hill for several miles, notably the Tennessee, Highland Chief, Alps group, Tenderfoot, Silver King, and others.

Several companies are organized and preparing to commence work in the neighborhood as soon as the weather is suitable.

ILLINOIS.

A telegram to the Chicago *Inter-Ocean* says that the Peru diggings, near Galena, the most extensive black-jack mines in this part of the Northwest, have been closed by order of the owners, the La Salle Zinc Company, whose works at the latter place have been abandoned on account of the flood. The closing of the mines throws 110 men out of employment.

MAINE.

BLUE HILL.—Development-work is progressing vigorously, the main shaft having reached the third level and started for the fourth. The rock is changing its character somewhat, becoming much more favorable and easier to work. Thirty-five men are employed.

MASCOT.—A cross-cut from the lower level struck the hanging-wall of the vein, at a distance of thirty feet from the tunnel, and encountered on the wall a seam of solid galena fully ten inches thick. The force at this mine is soon to be increased.

MEXICO.

A large body of rich ore has just been struck in the Cusihuiriachic mine, near Chihuahua.

A statement published by Señor Lorenzo Castro shows the number of mines worked and idle in the different States, as follows: State of Aguas Calientes, 23 mines worked. State of Chihuahua, 575 mines given, about half being idle. State of Coahuila, 51 mines, nearly all idle. State of Durango, 43 mining dis-

Digitized by Google

ricts, but the number of mines not given. State of Guanajuato, many mines, but the number not given. State of Guerrero, 450 mines, number worked not given. State of Hidalgo, 137 mines in 5 districts, with 11 districts not given, 23 mines worked. State of Jalisco, 303 mines worked, number of idle mines not given. Federal District of Mexico, 65 mines worked and 259 idle. State of Michoacan, 55 mines worked, number idle not given. State of Morelos, 30 mines idle. State of Nuevo Leon, very many mines, number not given. State of Queretaro, 69 idle mines. State of San Louis Potosi, 90 mines worked and 231 idle. State of Sinaloa, 406 mines, 32 gold placers, 9 salt mines, and 52 smelting-works. State of Sonora, 34 mineral districts. State of Tamaulipas, 6 mining districts, 8 mines worked, 37 old ones idle, whole number not given. State of Zacatecas, number not given, but it is large and the mines rich. The wonderful Veta Grande, Veta Negra, El Sombrerete, and other old and famous mines are in this State.

A correspondent of the Mexican *Financier* gives the following notes on the Real del Monte and Pachuca districts:

The Dulce Nombre mine, in the Real del Monte District, was first located in 1820, and was recorded then. A shaft was sunk on a north and south lode which at a depth of 550 feet dipped to the east. The shaft is 10 by 16 feet from surface to the bottom. The vein averaged ten feet, with firm hanging and foot-walls of porphyry. A very rich pay-streak in the vein averaged two feet six inches; but the ores were very refractory, and under the old system much of their value was lost. This mine has been re-located lately. The owners propose to drift south from the bottom of the shaft, so as to intersect another diagonal lode cropping on the surface and showing good prospects. It is expected that the junction of the two lodes can be reached by about 70 feet of drifting.

The San Ignacio mine still yields large quantities of good ore. Those interested, however, are looking down at the water covering all below the 80-foot level, and which they have not the means to remove, though it is known to cover very rich ores. If a company controlled this mine with resources to buy and work the Acosta pumping-engine near by, the property would become very valuable.

The Gran Trompillo mine, in the Lerezo District, is to resume operations, under Mr. M. Fuertes as president, and Mr. A. Vergara as superintendent. The mine is a good one, but has been idle because of differences among the owners, now happily settled.

After four months of delay, a manager has at length been appointed for the Santa Gertrudis mine, in the person of Mr. Bolland, late manager of the San Buena Ventura mine. The mine is in excellent ore, but it remains to be seen whether better management will insure resumed dividends. The ores average eight marks to the montone, a mark of silver being quoted at eight dollars, equaling $64 per montone, or $42.50 per ton. The reduction-works charge $38 for working the ores, leaving only four dollars per ton for all expenses and dividends. And yet we are told that stamps and pans and settlers which in the United States work $10 ores to advantage can not work these ores as well as the patio process! Somebody has been reaping profits, but it is not the stockholders.

There has been a great improvement in the ores of the Encino mine, at Pachuca. There are rumors here that a strong company has been formed in England, not to lease or locate mines, but to purchase and work developed property showing clear title.

MICHIGAN.

CENTENNIAL.—New openings on the north end of the Osceola lode are exposing vein-matter most favorable in character.

DETROIT.—The cave-in hinders the work of ore-hoisting at present; but the fallen ground is taken to the surface at a rapid rate, and the mine will soon again be in as good shape as ever. It is improving in ore-showing as work progresses.

LAKE ANGELINE.—The developments at the new shaft are of a gratifying character. The shaft is down 157 feet, and from the bottom a drift has been driven 100 feet toward the lake, all the way in clean ore and without encountering any rock, while another in the opposite direction caught the hanging in 30 feet. The ore is a very fine quality of Bessemer hematite, and the drifts would seem to indicate that the deposit is a very large one.

MCCOMBER.—According to the Norway *Iron Chronicle*, operations are to be suspended and all the men discharged, except three or four, who will be retained to run the pumps. The reason assigned is the inability of the company to make sales of ore, a large amount remaining unsold in Cleveland and also at the mine. The Union Iron and Steel Company, of Chicago, was indebted to the McComber in the sum of about $30,000 at the time of its failure.

NEVADA.

Four important suits were recently commenced in the District Court of Storey County. The plaintiffs are the Consolidated Imperial Mining Company, the Kentuck Mining Company, the Crown Point Gold and Silver Mining Company, and the Yellow Jacket Silver Mining Company, against the Original Gold Hill Gold and Silver Mining Company, defendant. The suits are brought under the United States laws regulating applications for patents and adverse claims thereto. It is alleged in the complaints that the latter company has made an application for a patent from the United States, and that its alleged premises and property conflict with the several mining claims of the said plaintiffs. These suits, consequently, are to settle the question of the boundaries of the said claims, and to quiet title thereto. It is understood that the Bullion Mining Company will also begin an action against the same defendant in a few days, and on the same grounds.

ALBION.—A dispatch from Eureka to the San Francisco *Stock Report* states that a crisis in the affairs of this company has occurred, and that there is no hope of a settlement. The mine and furnaces have been closed.

EUREKA CONSOLIDATED.—The Logan shaft has reached a depth of 1000 feet. The machinery is working well.

SILVER STATE.—The cross-cut in the main tunnel is now in nearly 30 feet, the face of it being in a good lime formation, with good-looking iron and small streaks of low-grade ore running through it. There are several good ledges visible on the surface of the claims that comprise this mine, from which rich ore has been extracted. The main tunnel is sure to encounter some of these when it is carried in some short distance farther.

NORTH CAROLINA.

The Salisbury *Watchman* says:

CID.—This mine has been recently opened. The vein is bold, incased in walls of solid blue slate. The shaft is sinking on the incline of the vein. The ore is highly cupriferous, with an occasional trace of gold.

CROWELL.—Prospecting and some sluice-washing are carried on. The severe weather has greatly retarded work.

DUTCH CREEK.—Prospecting and underground development are the only work going on. A new shaft has opened a vein of peacock ore.

EMMONS.—Work is going on, and the machinery from the Baltimore gold and silver mine (which has been abandoned) is in course of erection on this property with a view of opening it up.

GOLD HILL.—Work is progressing in the most satisfactory manner. The Old Field vein is proving all that had been anticipated. The pumps are going steadily, forking the water from the Randolph shaft. The appearance of the place indicates that the work will be pushed with reasonable vigor, with good prospects of permanent success.

SILVER VALLEY.—As formerly stated, the output of this mine has been sold to a smelting firm in Swansea, Wales. During the winter months, no ore could be hauled to the railroad. There are on the dumps about 800 tons of ore. At present, the operators are hoisting ore from one shaft, and dropping a large pump into a new shaft. As soon as the roads will allow constant travel, they will continue shipping their ores.

PENNSYLVANIA.

The California mine, at Boyertown, Berks County, owned and operated by the Phœnixville Iron Company, will be immediately prepared for active operations. The mine has been lying idle for a number of years.

UTAH.

EMPIRE.—The mine was flooded Thursday night, and work has been temporarily suspended, says the Park *Mining Record* of February 24th. It is thought the recent actions brought against the company in the Third District Court will be satisfactorily adjusted. The company has been very unfortunate in its operations in this district, and the blame can not be attached to any of the superintendents or to the ground which is worked. Good judges who have gained access to the mine are firm in their belief that, if work was continued without interruption, the Empire would soon come out in the finest shape. There is good, rich ore in some of the levels, but to what extent is not known. We hope the management will be able to pump the mine out soon and continue work without interruption until the property is fully developed.

[This is the same report we have had in the "inspired" papers for several years. The facts are, that the Empire never had any considerable quantity of pay-ore, and there is now less probability than there was four years ago that it ever will find a profitable ore-body. We have advised the public many times during the past four years of this fact.—ED. E. AND M. J.]

SAMPSON.—The following dispatch from the manager has been received in this city: Cross-cut to ledge from bottom of incline in two feet ore. Drifted about 20 feet each side. Ore improving every foot and is high grade. This gives us so far 40 feet in length, 60 feet in hight, and 2 feet in width of high-grade stoping ground, and assures the mine to be self-sustaining for further developments. Will ship two or three car-loads as soon as sampled.

PATENTS GRANTED BY THE UNITED STATES PATENT-OFFICE.

GRANTED FEBRUARY 6TH, 1883.

271,627. Boiler Furnace. William A. Greene, Brooklyn, N. Y.
271,657. Ore and Mineral Separator. Robert H. Richards, Boston, Mass., and Frederick G. Coggin, Lake Linden, Mich.
271,683. Cupola-Furnace. William J. Clapp, Nantyglo, and Thomas Griffiths, Blaenavon, County of Monmouth, England.
271,717. Production of Sound Ingots and Apparatus therefor. Frederick A. Krupp, Essen, Germany.
271,792. Stone-Drilling Machine. James T. Clark, Bath, Cal.
271,829. Double-Acting Pump. Hamline J. French, Pelham Manor, and George G. Shenton, Brooklyn, N. Y.
271,906. Process of and Apparatus for obtaining Chlorine and Sodium. André Leopold Nolf, Brussels, Belgium.
271,929. Miner's Pick. Harvey F. Seybert, Brady's Bend, Pa.
271,989. Smoke-Burning Furnace. John Ritchie, Chicago, Ill., Assignor to John N. Manning and George Mehring, same place.

GRANTED FEBRUARY 13TH.

272,035. Smoke and Gas Consuming Furnace. George Farr, Cincinnati, O.
272,045. Ore-Amalgamator. William E. Harris, New York City.
272,085. Basic Process for the Dephosphorization of Iron and Steel. Jacob Reese, Pittsburg, Pa.
272,086. Universal Rolling-Mill. Jacob Reese, Pittsburg, Pa.
272,088. Casting Brass and other Metals. Henry A. Rowland, Baltimore, Md.
272,195. Vapor-Burner. Henry S. Belden, Canton, O.
272,331. Combined Instrument for Leveling, Surveying, etc. Rudolph Peter Gallis, Hartford, Conn.
272,233. Stone-Breaking Machine. Philetus W. Gates, Chicago, Ill., Assignor to the Gates & Scoville Iron-Works, same place.
272,249. Pig-Iron Breaker. William R. Havens and John W. Nesmith, Denver, Colo.
272,264. Steam-Pumping Engine. Philip S. Kingsland, Chicago, Ill.
272,326. Radiator for Furnaces. Dwight S. Richardson, Brooklyn, N. Y.
272,343. Pump. William R. Smith and Neil A. Bigger, Bentonville, Ark.
272,378. Process of and Apparatus for Burning Water-Gas in Furnaces. Charles J. Eames, New York City.
272,391. Process of and Apparatus for Extracting Metals from their Ores. Antonin Thiollier, Villebœuf de Roche la Moliere, Assignor of one half to Albert Ancel, Chateau de Bouches d'Uzure, Canton de Craon, Mayenne, France.

GRANTED FEBRUARY 20TH.

272,428. Turbine Water-Wheel. Marquis D. Grow, Dubuque, Iowa.
272,431. Hoisting-Machine. Edwin Harrington, Philadelphia, Pa., Assignor to Edwin Harrington & Son, same place.
272,439. Hoisting-Machine. Harry S. Haskins, Philadelphia, Pa., Assignor to Edwin Harrington & Son, same place.
272,458. Condenser for Pumping-Engines. William A. Miles, Copake Iron-Works, New York.
272,494. Surveying Instrument. Charles W. Stickney, Washington, D. C.
272,497. Chill for Chilling Metal. William Tuttle, Dowagiac, Mich.
272,504. Steam-Boiler Furnace. Charles H. Wilson and Samuel S. Wilson, Paducah, Ky.
272,509. Ore-Concentrator. John M. Adams and William F. Carter, San Francisco, Cal.
272,544. Amalgamator. William E. Harris, New York City.
272,550. Coal-Car. David Hoit, West Albany, Assignor of one half to Charles R. Hicks, Troy, N. Y.
272,564. Amalgamator. Stephen G. Lindsey, Salt Lake City, Utah.
272,599. Assay-Furnace. John C. Tappeiner, Bisbee, Ariz.
272,614. Machine for Concentrating and Amalgamating Ores. David H. Anderson, Butte City, Mont.
272,682. Art of Preparing Steel Ingots for Rolling. William Hainsworth, Pittsburg, Pa.
272,683. Bessemer Plant. William Hainsworth, Pittsburg, Pa.
272,684. Feed-Water Heater for Steam-Boilers. Edward J. Hall, Buffalo, N. Y.
272,687. Mechanism for Preventing the Lapping of Belts on Shafting. William Hayes, Jr., Fall River, Mass., Assignor to himself and Samuel D. Howland, same place, and Charles E. Cook, Dartmouth, and Abbott P. Smith, New Bedford, Mass.
272,711. Apparatus for Compressing Air. James J. Lawler, Scranton, Pa.
272,726. Machine for Amalgamating Ores. Edward R. Lucas, Peoria, Ill., Assignor of one half to Willard W. Lind, same place.
272,741. Amalgamator. William Moller, Yonkers, N. Y.
272,742. Amalgamator. William Moller, Yonkers, N. Y.
272,766. Charcoal-Kiln. Henry M. Pierce, Chicago, Ill.
272,771. Air-Compressing Machinery. George H. Reynolds, New York City, Assignor of two thirds to Cornelius H. Delamater and George H. Robinson, both of same place.
272,788. Gold-Washer. John P. Spencer, South Pueblo, Colo.
272,804. Apparatus for the Purification of Coal-Gas. Charles C. Walker, Lilleshall, County of Salop, and William T. Walker, Highgate, County of Middlesex, England.

GRANTED FEBRUARY 27TH.

272,930. Smoke-Consuming Furnace. Harvey R. Wolfe, Louisville, Ky., Assignor to Charles A. Wolfe, Thomas Brennan, W. Garnett Munn, and John Leamy, same place.
272,959. Ore-Furnace. Frederick J. Hoyt, New York City.
272,976. Process of Manufacturing Charcoal. Henry M. Pierce, Chicago, Ill.
272,977. Rock-Drill. Thomas Radford, Bloomington, Ill., Assignor of four-fifths to James B. Stevenson, William Stevenson, Matthew T. Scott, and William Radford, all of same place.
273,011. Apparatus for Extracting Gold and Silver from their Ores. Richard Barker, London, County of Middlesex, England.
273,014. Air-Compressor. William A. P. Bicknell, Riverdale, New York County, N. Y.
273,051. Dumping-Car. Lawrence Fitzsimmons, Alleghany, Pa.
273,099. Steam-Boiler Furnace. Frank H. Kane, Riverside, Assignor of one half to William Kruse, Sedamsville, O.
272,156. Safety-Shell for Blasting. Robert B. F. Reed and George Freund, Durango, Colo., said Reed Assignor to said Freund.
273,194. Gas-Seal for Blast-Furnaces. Edward A. Uehling, Sharpsville, Pa.
273,230. Process of and Apparatus for Manufacturing Gas. John Hanlon, New York City; James E. Leadley, Camden; and Silas Gibbs, Warren County, N. J., Assignors to the United Gas Improvement Company, Philadelphia, Pa.

FINANCIAL.

Gold and Silver Stocks.

NEW YORK, Friday Evening, March 9.

The mining market continues very dull and has been almost featureless. In fact, the only item worthy of mention has been the sharp decline in Robinson Consolidated. This stock reached its weakest market price to-day. The remainder of the market is of little interest. The dealings have been mostly in such low-priced stocks as Sonora Consolidated, Decatur, Elko, etc. Amie records a large business, and has been quite strong. A summary of the market is given below: The total sales of mining shares at all the Exchanges aggregate 416,443, as against 447,381 last week.

The Comstock shares have been very quiet at steady prices. California was weak, selling from 15@10c. with a business of 3550 shares. Consolidated Virginia was also quiet and weak, selling from 60@51c. Sierra Nevada records a quiet business at strong prices, selling from $3.50@$4. Union Consolidated was also strong, under a small business, selling from $4.75@$6@$5.25. Yellow Jacket was quiet and irregular at $1.63@$1.38@$1.50. Best & Belcher sold at $4 under one transaction. Sutro Tunnel was quiet and steady; it sold at 22@21c.

The Leadville stocks were also very quiet at steady prices. Amie Consolidated, the only exception to the rule, was very active and quite strong; it sold from 22@28@35c., with a business of 59,000 shares. Chrysolite records a quiet business at irregular prices, selling from $1.45@$1.35@$1.40. Iron Silver declined from $3@$2.90 under a small business. Leadville was quiet and irregular, selling at 70@65@70c. Little Chief sold to the extent of 1400 shares at 40@41c. Big Pittsburg was quiet and steady; it sold at 18@20c. Climax sold at 9@10c., with a business of 2300 shares.

The Bodie stocks have been quiet and irregular. Bodie Consolidated has levied an assessment, and has, in consequence, grown quite weak; it sold from $1.85 @95c.@$1 under a small business. Bulwer was quiet and irregular, selling from 95@90@93c. Standard records a moderate business and has been strong, selling from $6@$6.50.

The Tuscarora stocks have been quiet at about steady prices. Grand Prize was quiet and steady at 40@50c. Argenta sold at 55c., with one transaction. Belle Isle, with a small business, declined from 50@ 45c. Navajo had a moderate business at irregular prices; it sold from $4@$3.50@$3.75. Independence was weak, under moderate transactions, selling from 52@45c. North Belle Isle sold to the extent of 300 shares at 54@50c. Elko Consolidated was quiet and weak, declining from 10@7c.

In the miscellaneous list, Alice has declined from its recent strong prices, and this week sold from $3.15 @$3. Bassick has been quiet and steady at $10. Father de Smet records a moderate business at strong prices, selling from $4.75@$5. The Green Mountain stocks have been quiet and steady. Gold Stripe sold from 8@7c. Green Mountain sold from 64@69@68c. Rising Sun sold at 5c, and Cherokee at 4c. Homestake has developed a moderate business at irregular prices; it sold from $16@$15@$16@$15½. Horn-Silver has grown a little weaker, declining from $8.63@$7.75, with a fair business. Northern Belle has been quiet and strong, selling from $9.75@$10.50. Robinson Consolidated has been very active and quite weak; it sold from $1@84c., closing to day at 87c. Sierra Grande records a more moderate business than usual, and has been very irregular; the price of this stock ranged from $2.80@$3.05, closing to-day at $2.90. Silver King has been irregular, selling from $10¾@ $11½@$11.

Alta-Montana records a quiet business at steady prices, selling from 13@11c. Bradshaw has also been quiet and steady, and has sold from 33@31c. Decatur has been very active at steady prices, selling from 8@ 7c. Durango records a small business at 7@9c. Harlem M. and M. Company continues steady, selling from $1.25@$1.20, under a moderate business. Oriental & Miller sold from 16@14c., with a fair business. Silver Cliff was quiet and steady, selling from 38@42@40c. Sonora Consolidated has been very active and irregular; it sold from 38@51@40@50c., closing at 49c. to-day; the sales, or reported sales, aggregate 73,500 shares. South Pacific has been active and steady at 6@5c. The State Line stocks have been quiet and weak; Nos. 1 and 4 sold from 3@4c., and Nos. 2 and 3 from 7@6c. Taylor-Plumas records an active business at steady prices, selling from 16@19@18c. Eastern Oregon was moderately dealt in at irregular prices, selling from 75c.@$1@95c.

At the annual meeting of the stockholders of the Iron Silver Mining Company, held March 7th, the following-named gentlemen were elected trustees: Thomas F. Mason, John S. Newberry, James D. Smith, W. H. Stevens, R. H. Rickard, T. B. Brooks, L. H. Pierce, D. H. Dongan, and Jacob Houghton. At a subsequent meeting of the trustees, Thomas F. Mason was elected President; John S. Newberry, Vice-President; James D. Smith, Treasurer; Homer A. Hoit, Secretary; and W. H. Stevens, Chairman Executive Committee. A dividend of 20 cents per share was declared, payable March 28th. Total dividends to this date, $1,000,000.

In regard to the proposed union of the New York Mining Board and the New York Petroleum Exchange, the recent action of the Governing Committee of the former body is regarded as definitely settling that question. The committee passed resolutions forbidding members of the Board from joining any other organization that deals in pipe line certificates, and laid over the cases of those members who have already joined the Petroleum Exchange for future consideration.

MEETINGS.

Lucky Boy Gold and Silver Mining Company, No. 18 Wall street, New York. Annual meeting of stockholders and election of trustees, March 13th, from ten A.M. to twelve M

Total Wreck Mining and Milling Company, No. 18 Broadway, New York. Annual meeting of stockholders and election of trustees, April 10th, at three o'clock P.M.

DIVIDENDS.

The Barclay Coal Company, of Pennsylvania, has declared a semi-annual dividend of three per cent, payable March 15th.

The Consolidated Gold Mining Company, of Georgia, has declared its usual dividend.

The Kentuck Mining Company, of Nevada, has declared a dividend of 10 cents, payable March 19th.

The Iron Silver Mining Company, of Colorado, has declared a dividend (No. 10) of twenty cents per share, payable March 28th. Transfer-books close March 17th, and reopen on the 31st.

The Navajo Mining Company, of Nevada, has declared a dividend of twenty-five cents per share, payable March 13th.

The Osceola Mining Company, of Michigan, has declared a dividend (No. 14) of $1 per share, payable in Boston to stockholders of record March 10th.

The Shoshone Mining Company, of Idaho, has declared its regular monthly dividend (No. 4) of 1 per cent, payable March 16th. Transfer-books close on the 10th inst., and reopen on the 17th.

The Standard Consolidated Mining Company, of California, has declared a dividend of twenty-five cents, payable March 12th.

The Union Mining Company, of Maryland, has declared a dividend of 2½ per cent, payable on and after March 15th, at the office of the company, Room 46, No. 115 Broadway.

PIPE LINE CERTIFICATES.

Messrs. Watson & Gibson, petroleum and mining brokers, No. 55 Broadway, report as follows for the week ended Friday, March 9th:

The week, Friday, March 2d, opened with 98c. bid for United Pipe Line Certificates, and to-day it opened 88c. bid, or a decline of exactly 10c. per barrel during the week. This morning, a sharp decline followed the opening, declining to 86c., but reacting sharply to 90⅝c. and falling back to 89½c. bid at half-past twelve to-day.

The decline, during the past week, can not be fully explained, though there were some bearish facts, as indicated in our report last week.

The runs from the wells to the pipe lines were from 10,000 to 20,000 barrels per day in excess of the shipments from the oil regions. The surplus seemed to be increasing, contrary to the expectations of the "bulls," who predicted that the current demand would soon exceed the daily supply. But the selling movement, once inaugurated, margins were swept away; and when, on Wednesday, the McCalmont Oil Company's well near Reed & Brenneman came in as a large producer (1800 barrels per day), the market went down with a rush from 92 to 88 inside of five hours. This rapid and serious decline naturally caused heavy sales of long oil that holders could not carry, and even this was aggravated by the tight money market in New York, in which Stock Exchange houses were paying from 7 to 15 per cent for money. The "bears" pressed their advantage hard, and scarcely a reaction was experienced during the week until this morning. Our telegrams this morning from Oil City and Bradford advise us of a heavy short interest there, and report further that the McCalmont well, like all those found in the Cooper tract, is rapidly declining in its production. The market is nervous, and it is not likely to become permanently strong or even steady until the new Reno well comes in, and the size of the Patterson well is determined.

The following table gives the quotations and sales at the New York Mining Stock Exchange:

	Opening.	Highest.	Lowest.	Closing.	Sales.
March 3...	97⅛	97⅛	95⅛	95⅛	590,400

REVIEW OF THE SAN FRANCISCO MARKET.

The Comstock shares on the San Francisco market have been strong for a week past, but they suffered a slight decline at the close. No late news of importance has been received from the mines. There has been considerable strife for possession of Hale & Norcross, and it has acted to make the stock strong and scarce. The outside stocks have been rather quiet, not much interest being manifested in any, with perhaps the exception of Navajo. Independence has levied an assessment of thirty cents a share, and this has tended to make the Tuscaroras weak. Bodie Consolidated has also levied an assessment of fifty cents per share, and Albion one of fifty cents.

Copper and Silver Stocks.

Reported by C. H. Smith, 15 Congress street, Boston, Stock Broker and Member of the Boston Mining and Stock Exchanges.

BOSTON, March 8.

The market for copper stocks the past week has been sensibly affected by the passage of the new tariff bill, reducing the duty on ingot copper one cent per pound and admitting ore of low grade at reduced rates. Calumet & Hecla, the largest producing copper mine in this country, will be one of the first to feel the effects of this reduction, but, with its large surplus and ingot copper even at 15c. per pound, will no doubt continue to pay its regular dividends for many years to come. The stock has declined from $242 to $233 on forced sales of some frightened holders, with later sales at $235 closing, $233 bid. Quincy, the next mine of importance to the Calumet & Hecla as a producer and dividend-paying mine, has also declined on very free offerings of stock from

Digitized by Google

$50@$47. Franklin also declined from $12¾@$12, and Pewabic from $7½@$7. Osceola has been quite active for this stock, with sales at $30, a decline of $1 per share. A small lot of Atlantic sold at $14, same as before. Huron declined from $1¾@$1½, and Allouez sold at $2½.

In the silver stocks, Catalpa advanced from 62½@80c., when it betrayed weakness on reports that the mine was to be leased to tributers, and that the showing was not as good as formerly. The result was a decline to 57½c., closing, however, with sales at 60c. Crescent has been dull at 25@30c. Harshaw sold at 75c.; San Pedro at 65c.; and Silver Islet at $5. With the exception of Catalpa, the market has been dull and stupid.

At the Boston Mining and Stock Exchange, the feature of the week is the break in Empire, which closed strong last week at 29@30c. The report that the mine had closed down for the present induced a free selling of stock, forcing prices down to 17c., at which price buyers became plenty, and the stock closed quite firm. Massachusetts & New Mexico continues steady at 13@14c., assessment of 5c. paid. Brunswick Ship's Berth declined from $1@70c., but later sales were made at 80@85c. Simpson Gold was more inquired for, and a lot of 10,000 shares were sold at 6c., buyer 60 days.

3 P.M.—The market was without any special feature this afternoon. Quincy sold at $47. Calumet & Hecla, $233 bid, $235 asked. Franklin, $11½@$12½. Pewabic, $6¾@$7. Huron, $1¾ asked. Osceola, $30 bid. Allouez, $2½ asked. Catalpa, 55 60c. Crescent, 25@30c. Harshaw, 75c.@$1. National, $1 bid. Sullivan, $1 asked. San Pedro, 60@65c.

BULLION MARKET.

NEW YORK, Friday Evening, March 9.

In consequence of a receding sterling Exchange market, the rise of silver in London has been neutralized, and our figures for silver here remain unchanged.

* 51⅛@51 3-16.

Bullion Receipts at New York.—The bullion received from the mines at the various offices in this city during the week ended March 9th, as compiled from various sources, amounted to $258,298.41, as against $363,463.06 reported for the previous week. The receipts from January 1st, 1883, to date are $2,901,799.32.

Exports and Imports of Gold and Silver at New York.

Exports.

Week ended March 3d	$6,890
Corresponding week last year	2,501,600
Since January 1st, 1883	2,036,782
Corresponding period last year	11,294,340

Imports.

Week ended March 3d	$232,792
Corresponding week last year	59,622
Since January 1st, 1883	1,127,168
Corresponding period last year	645,255

Foreign Bank Statements.—The governors of the Bank of England, at their weekly meeting, made no change in the bank's minimum rate for discount, and it remains at 1 per cent. During the week, the bank lost £190,000 bullion on balance, and the proportion of its reserve to its liabilities was reduced from 48 to 42½ per cent, against 40 3-16 per cent at this date a year ago. March 8th, the bank lost an additional £340,000 bullion on balance, reported to have been withdrawn for shipment to the United States. The weekly statement of the Bank of France shows a gain of 3,400,000 francs gold, and a loss of 825,000 francs silver.

BULLION PRODUCTION FOR 1883.

We give below a statement showing the latest bullion shipments. These are officially obtained from the companies, where that is possible; and where official statements can not be procured, we take the latest shipments published in those papers nearest to the mines reported. The table gives the amount shipped for the week up to the date given, as well as the aggregate shipments to such date from the first of January, 1883.

The shipments of silver bullion are valued at $1.29·29 per ounce troy; gold at the standard $20.67 per ounce troy. The actual value of the silver in the following table is therefore subject to a discount, depending on the market price of silver. If the price of silver be counted at $1.12 an unce, which has for some months been about its average value, the following figures, where they relate to silver bullion, should be diminished by about 13½ per cent, to arrive at actual value.

MINES.	States.	For the week.	Month of February.	Year from Jan. 1st, 1883.

METALS.

NEW YORK, Friday Evening, March 9.

According to statistics compiled by Mr. Edward J. Shriver, Secretary of the New York Iron and Metal Exchange, the following was the import movement of metals to this port in the first two months of the year:

Articles.	Imports. Net tons.	Stock in bond. Net tons.
Tin	1,618	.....
Spelter	559	327
Copper (old chiefly)	37	6
Antimony, casks	583	125

The exports for the two months include 353,112 pounds of copper, to which 186,115 pounds have been added during the first week in March.

Copper.—The market has been dull and quiet, with values declining further. Lake is selling in small lots at 17¾c., and bids generally do not go higher than 17½c. There is a little inquiry for export. Small sales, aggregating about 100,000 pounds, have been made of Baltimore and other brands at 15¾@15½c. At the close, 15¼@15⅝c. is bid, but has been declined.

English cables are a little better, being £65 15s.@£66 5s. for Chili Bars, and £71@£71 5s. for Best Selected.

Tin.—With a moderate business doing and better advices from England, London cabling £94 15s. for Straits, the feeling here is better, Straits being held firmly at 21c. cash for round lots. Large foreign buyers have been in the market, offering to take round lots at 20¾c., without, however, procuring any tin.

Lead.—The week has been one of much interest in the lead trade, and for two or three days there was considerable excitement, which has now, however, entirely abated. On Tuesday, the holders of Pueblo and Newark lead in this market cleverly set the ball rolling, and within two days disposed of fully 2400 tons of those brands, one large pipe and shot mill alone taking nearly 1500, while the rest was taken by other manufacturers, dealers, and one corroder, who refines common lead. In addition to the quantity given above, about 600 tons of various brands of Missouri lead found takers. The first sales were at 4·60c., the bulk, however, being at 4·65c. Since then, 200 tons of a Western desilverized corroding brand sold at 4·67½c. This movement effectually reduces the spot stock of one of the largest holders; but, on the other hand, has pretty well supplied the large trade, so that a period of dullness may be looked forward to. It is not likely that, for the present, holders will be inclined to accept lower figures. We quote nominally 4·65c. for Common and 4·70c. for Refined, but would add that round lots offered of the latter were not taken at that figure.

It is officially announced that the recent statement that the Eureka companies had made a contract to ship 10,000 tons of lead East was based on a misunderstanding. It was stated that the contract (meaning the old one) had now been completed. No arrangements have as yet been made as to a new contract

Messrs. John Wahl & Co., of St. Louis, wire us as follows to-day:

Our market is unchanged. There have been sales of 300 tons of Refined during the week at 4·25c. Charcoal is quoted at the same figure.

London cables £13 10s.@£13 15s.

Spelter.—This metal continues dull, with quotations unchanged at 4⅝@4¾c. for Common Domestic. England cables £15 15s. @£15 17s. 6d.

Sheet-Zinc.—Manufacturers have advanced the price ¼c., making it now 6⅝c., spot.

Antimony.—The feeling is fairly good, with quotations nominally unchanged at 10@10½c. for Hallett's, and 11@11½c. for Cookson's.

Quicksilver.—The market closes at 36@36½c. There is no price for flasks. Transactions of late have been large, including the sale of 2000 flasks that have been in stock for two years.—*San Francisco Journal of Commerce.*

IRON MARKET REVIEW.

NEW YORK, Friday Evening, March 9.

According to statistics compiled by Mr. Edward J. Shriver, Secretary of the New York Iron and Metal Exchange, the following is the import movement into this port for the months of January and February:

Articles.	Imports. Tons.	Warehoused. Tons.	Withdrawn. Tons.	Stock in bond March 1.
Pig-iron	16,416	2,250	540	4,532
Spiegel iron	2,116	.....	460	2,545
Old rails	2,476	1,778	1,799	4,501
Scrap iron	4,367	1,435	150	1,979
Steel rails	673	.....	.....	2,603
Scrap steel	1,190	.....	.....	456
Iron rails	.....	.....	84	5,558
Iron ore	10,237	.....	.....	.....
Steel wire rods	20,539	1,895	1,317	5,131
Iron wire rods	2,092	490	.....	1,197
Swedish iron	1,600	511	437	1,640

American Pig.—The Thomas Iron Company has opened its books for orders for the season's delivery, and has closed contracts aggregating 6000 tons at $24 for No. 1 and $22 for No. 2 Foundry. The other companies are following suit, and those making red-short irons are booking orders for a little less than above figures. Thus far, buyers are not displaying much vim, although some of them are insisting upon prompt delivery. The Thomas Company is not selling Gray Forge, having booked in all orders for 30,000 tons, the full capacity for this grade. We quote: $23.50@$25 for standard to choice brands of No. 1 Foundry; $21.50@$22.50 for No. 2; and $19.50@$20.50 for Gray Forge, all at tide-water. In Bessemer pig, the only thing of interest is the rumor of a sale at low figures of a lot of American. We quote nominally $22@$22.50. Spiegeleisen is dull at $27, nominally, for 10 to 12 per cent, and $32 for 20 per cent, at which 1500 tons are reported sold from Baltimore and Philadelphia. The aggregate make of spiegeleisen in Germany in 1882 is estimated by the German Iron-Masters' Association at 157,714 metric tons.

Scotch Pig.—Business has been dull, but the market has been fairly steady. Arrivals aggregate about 1200 tons, all of which have gone into consumption. Freights are unchanged at 6s.6d. from Glasgow to this port. We quote: Coltness, $24.50@$25; Summerlee, $24@$24.50; Glengarnock, $22@$22.25; and Eglinton, $21.25@$21.50. The Wall Street Exchange has received the following cable quotations from Glasgow to-day, showing little change: Carnbroe, 55s. 3d.; Gartsherrie and Summerlee, 62s. 3d.; Coltness, 64s. 9d.; Langloan, 65s.; Glengarnock, 55s. 3d.; and Eglinton, 49s. 9d. Warrants were 47s. 8d.

Rails.—Increased inquiry has led to a number of transactions aggregating 10,000 tons in small lots at about $39 at mill, almost exclusively for delivery beyond July. Most of the Eastern mills are engaged up to that time. England is unchanged at £5@£5 5s.

Old Rails.—We hear of no transactions worthy of special mention. We quote $23.50@$24.50 for Ts, and $27@$27.50 for D. Hs., of which there are few here.

Scrap.—Business is quiet, holders having firmer views. We quote nominally $25@$25.75.

Philadelphia. March 9.

The situation of the Eastern Pennsylvania iron trade has materially improved since my last report, and though not much more business has been closed, a great deal is in hand and likely to be placed any hour. Manufacturers throughout the city feel that they have been freed from a nightmare, and speak with a great deal more confidence of the present situation of trade and its future than they have done for three months. They congratulate themselves on their escape from the battle-field with so much credit.

Pig-Iron.—To-day's quotations for standard brands of Foundry Iron are $25 for No. 1 and $23 for No. 2. A fair inquiry is coming to hand, and orders for several thousand tons will be placed before Saturday night. The trade will meet all requirements at current rates. Those who defer covering requirements for standard brands will perhaps pay a little more in two or three weeks. Foundry Iron is also in good request, and a few pretty large transactions were closed at about $20.50@$21, though some lots as low at $20, tide-water quotation. There will be no effort made to advance prices.

Manufactured Iron.—Merchant Bar has improved in demand, and prices are unchanged. Buyers have not yet placed very many large orders, but from the tone of correspondence to hand yesterday and to-day, manufacturers and brokers feel confident that the business of the next two weeks will be such as to impart an upward tendency. Mills are all short of orders and are hungry for trade. Muck Bars are selling at $37 at mill, and a half-dozen buyers have been heard of to-day. Charcoal Blooms are quoted at $63 @$65, and Anthracite at $54@$56.

Sheet-Iron shares in the general improvement, and leading manufacturers report an increase in orders, though most of them are small lots, and 4@4½c. is still quoted. Concessions will be extended on large orders until the capacity is pretty well occupied for from 60 to 90 days. Several small lots of Plate and Tank were closed at inside figures. The demand is improving, and quotations are 2½c. for Tank; 3·40 @3·50c. for Shell; 4·30@4·50c. for Flange; and 5¼ @5½c. for Fire-Box.

Steel Rails are quoted at $39@$40, and rail companies have several inquiries in hand which will result in business at about this price. Small orders are booking, and large orders are under consideration.

Old Rails are quoted at $25.50@$26; Double Heads, $27@$28. Demand light. Scrap sold ex yard at $25@$25.50 for medium. Two or three selected lots sold at $27.

COAL TRADE REVIEW.

NEW YORK, Friday Evening, March 9.

Anthracite.

The anthracite coal trade is quiet but still shows signs of an undercurrent of more strength. The supply is no longer excessive, nor is there any evidence of scarcity. The trade is getting into good shape, and the action of the majority of the companies in refusing to start full work next week is likely to keep it so for the time being. Two or three companies, it is understood, were, for a number of days, pressing for full time, and there were a number of conferences on the subject, which resulted finally in a decision to continue restriction, possibly till the end of the month. How matters will shape after resumption, remains to be seen. Consumers are still slow in buying, and show little anxiety to replenish stocks, except possibly in steam sizes.

Bituminous.

The market is very dull and the outlook is not particularly encouraging. Consumers are evidently looking forward to a break, and the offers and protestations of large shippers, both in the Clearfield and Cumberland regions, certainly are not calculated to dispel such a notion. There is a feeling of mutual distrust and an anxiety not to be outdone by rivals which will work to the advantage of buyers. The latter, however, appear to be as much at sea as the shippers, who are as yet uncertain as to what course the railroad companies will pursue.

So far as current business is concerned, there is little to report, Cumberland coal, alongside, offering as low as $4.50@$4.70, and Clearfield nominally the same, with Broad Top $4.60@$4.65.

STATISTICS OF COAL PRODUCTION.

Comparative statement of the production of anthracite coal for the week ended March 3d, and year from January 1st:

TONS OF 2240 LBS.	1883. Week.	1883. Year.	1882. Week.	1882. Year.

Advertisers' Index xi

AS will be noted from the second list of subscriptions to the Holley Memorial Fund, which we print elsewhere, the total amount has not yet been quite raised. Other subscriptions are promised, and there is no doubt that the sum estimated to be necessary will be collected, it is believed chiefly by a large number of small contributions.

ON the second of this month, Mr. CLARENCE KEMPER CRESSY, for a number of years connected with the Scientific Publishing Company, died of pneumonia, after a brief illness. He was the son of the late Brevet Commodore W. A. CRESSY, U. S. N. He studied law for two years, and displayed marked ability in the position of trust which he occupied.

M. PAUL TRASENTER'S statistical review of the status of the steel trade of the world, which we print elsewhere, shows rare insight into the questions which have been agitating the steel-makers of the continent and of Great Britain for the past few years, and which now are beginning seriously to agitate those engaged in the industry in this country. European makers who have not had a railroad system developing with enormous rapidity to fall back upon had to face an over-supply years ago, and obtained only temporary relief through the outlet which, for a few years, high prices in this country opened to them. So far as the prospective demand for new construction and renewals of railroads is concerned, the producers in this country are exceptionally well situated. But, on the other hand, the absence of any great ship-building industry, and, under the new tariff, a threatened sharp competition in the supply of wire rods, restrict an outlet to which, under other circumstances, they might turn for relief. The market for boiler-plates is not a promising one until consumers can be taught that the product of a Bessemer converter can be made as high in grade as that of an open-hearth furnace.

M. TRASENTER is not one who delights in "sounding the death-knell" of the puddling-furnace, which, as he well points out, is destined, for many years to come, to fill the demand for the commoner grades.

It has been a source of regret to us that the absence of data has, in so many instances, made it impossible to place the figures relating to the United States in the list. Thus, we have no means of accurately stating the various grades of pig-iron, nor can we, with any degree of accuracy, follow the raw material, iron or steel, into the many channels into which it goes as a finished product, so far as the rolling-mills are concerned; and these defects become more striking still in the statistics of Great Britain. Until now, in our country, there has been comparatively little occasion for such greater detail in the statistics of the manufacture of steel. But now, when the time is approaching that such data are of incalculable value, is it too much to ask the steel-makers of the country to place such figures at the disposal of Mr. JAMES M. SWANK, who, we are sure, will gather and arrange them with his usual skill and accuracy? In England, the good work was only begun a few years ago by Mr. J. S. JEANS, who has shown much enterprise, and will probably in time succeed in this direction also.

LINE UPON LINE.

It appears that we were too sanguine in expecting the Editor of the *Iron Age* to disavow the wrong presumably done by a subordinate and inexperienced journalist in permitting his columns to be used for an anonymous accusation of deliberate falsehood against Messrs. EDWARD COOPER and ABRAM S. HEWITT; and this, too, for a second time, after those gentlemen, in a dignified protest, had offered the *Iron Age* every opportunity to satisfy itself as to the facts. It now appears that the Editor was his own subordinate. We might even infer that he had been, after the fashion of the late Mr. TOOTS, his own correspondent, but for his declaration that this person was "a disgusted reader"—a characterization which opens a wide field for conjecture, with but one limit: it excludes, we presume, the Editor himself.

We shall not engage in any impertinent allusions to the private friendships of the Editor of the *Iron Age*, or charge him with trying to make himself famous by either attacking or defending "a great man." In his private life associations, accomplishments, and character, we are not aware of any particular in which he could be improved; and if we were, we should not choose the columns of this journal for an allusion to the subject. But in the matter of journalistic etiquette and honor, the Editor of the *Iron Age* has much to learn; and we will give him, line upon line, a little elementary instruction.

The first principle, the knowledge of which would be an inestimable advantage to him, is, that it is one thing to accuse men of mistake, and another to accuse them of falsehood. And when the falsehood is alleged to be uttered with the deliberate purpose of misleading the public and concealing the fact that the utterers are seeking, under the hypocritical pretense of the public good, to advance their private interests, the difference is as great as it well could be.

The issue made by the disgusted reader of the *Iron Age* (and now adopted by the disgusted Editor) with Messrs. COOPER & HEWITT, is of both kinds. Mr. HEWITT is accused of error on several points, concerning which he might have been honestly mistaken. Whether his firm are the largest miners of iron ore in New Jersey; whether the cost of New Jersey and Pennsylvania ore is invariably less than the freight on foreign ores; whether every ton of foreign ore imported permits exactly a ton of domestic ore to be used; and so on, are matters concerning which a positive contradiction involves no charge of dishonesty. If the *Iron Age*, not wishing to discuss the main argument presented by these sweeping assertions, prefers to pick flaws in the assertions themselves, and to assert that somebody else is a larger miner of iron ore; that not every pound of New Jersey or Pennsylvania ore is put on the cars for less than the freight from Africa or Spain to New York, but, on the contrary, several pounds have been sold for more; that less than a ton of domestic ore is used with a ton of foreign ore; and so on, it is free to argue in that way; and the ENGINEERING AND MINING JOURNAL takes just as much interest in the argument as it deserves, that is to say, very little. On the main question, whether low duties, or no duties, on iron ore would benefit the iron industry throughout, we have expressed our opinion, and given our grounds for it.

But the *Iron Age* (which now avows responsibility) and a certain class of assailants who do not avow responsibility began long ago a systematic attempt to weaken the force of the arguments of Mr. HEWITT by asserting that he was secretly endeavoring to promote the interests of his firm; that his pretense to be identified with the ore-producing industry was a fraud; that he was, "as usual," attempting to "mislead the public;" and that his preponderant interest is in the manufacture of wrought-iron, not the production of ore or pig. This charge was speciously qualified with an allusion to the State of New Jersey, behind which the utterers of the slander now take refuge. The *Iron Age* says it regarded this accusation as true, and was fully prepared

Digitized by Google

to publish it. In other words, it was perfectly aware that a technical distinction, calculated to mislead the public, was being made the basis of a charge of dishonesty. The charge itself was false, as the *Iron Age* tacitly confesses; but the words in which it was couched being carefully guarded so as to leave a geographical loop-hole through which the libeler could crawl, the *Iron Age* was "fully prepared" to publish it. This kind of preparation to publish ought to be made very secretly, and not avowed afterward.

The ingeniously prepared statement probably did mislead the public; at all events, it misled Messrs. COOPER & HEWITT, who met the essential misrepresentation of their business with a dignified and positive contradiction. A rejoinder in the *Iron Age*, repeating the original assertion, with offensive aggravation, followed: and upon this we based our article of March 10th. That article was not seen by Mr. HEWITT until it was in print; it was not suggested in any way by him; it was not intended to defend him or his firm; it was not an answer to the impudent "invitation to Mr. HEWITT to vindicate his reputation for veracity." Mr. HEWITT himself can answer invitations of that kind whenever he thinks them worthy of notice.

Our article was neither more nor less than an exposure of the unworthy and contemptible course into which the *Iron Age* had been betrayed, and the responsibility for which its Editor had not then, as he has since, assumed. In reply, the *Iron Age* now proceeds to administer what it elegantly terms a "spank"—which is, we beg to observe, a very feeble offset to a brand. The temporary blush caused by the one soon fades out, the mark of the other is less easily removed. *

THE NEW YORK CITY WATER SUPPLY.

A report has recently been made by a very honorable committee upon this subject, in which the universally admitted urgent need of a larger supply of water for the city was insisted on and the Croton water-shed was stated to be the best and cheapest source of supply available. The committee was divided as to whether the increased storage capacity called for should be provided by the erection of a monster dam at Quaker Bridge, or by several smaller dams at points higher up the Croton Valley.

Though the members of the committee, FRANKLIN EDSON (Mayor), WILLIAM DOWD, JOHN T. AGNEW, O. B. POTTER, AMOS F. ENO, and HUGH N. CAMP, are not engineers or experts, yet they state that they "have had before them eminent engineers possessing experience and knowledge respecting the water supply of this and other cities." It would have made this report still more valuable had the names of the expert authorities and their testimony, of which stenographic reports were kept, been published.

The Commission recommends the building of a 15-foot diameter aqueduct, 27 or 28 miles in length, and is divided as to the advisability of building the Quaker Bridge dam, which would be some 230 feet in hight from bed-rock, and we believe about half a mile in length, and which it is estimated would cost about five million dollars, and require five and a half years to complete.

While no engineer will question the possibility of building a dam capable of withstanding a pressure of 230 feet, or say 100 pounds per square inch, yet under that pressure no common masonry can be counted on to prevent filtration, and no dam that leaks can be considered perfectly safe. The incalculable damage that would result from the bursting of such a dam should also be considered; for it is certain that, if it should give way, it would leave neither trace nor vestige of building or arable land in the valley from Quaker Bridge to the Hudson River.

The construction of the aqueduct is a mere question of money. It presents no engineering difficulties at all comparable with the building of such a dam. Whether an aqueduct is the cheapest or best means of bringing the water to the city, is quite another question, and we are surprised that this commission has not even referred to such other means as siphon-pipes, so largely in use elsewhere for conveying water.

A proposition has been made to secure the increased water supply from the Ramapo water-shed, and to bring the water to the city as water is so successfully and cheaply conveyed throughout our California hydraulic mining districts, and to the city of San Francisco and many other places, by means of iron pipes, following the irregularity of the surface. Unquestionably, this method is far less expensive than an aqueduct, while it has the immense advantage of utilizing the pressure, which, in the case of the Ramapo plan, would, we hear, amount to some 250 or 300 feet head, say 120 pounds per square inch, at the city line. This would probably be sufficient to dispense with steam fire-engines wherever pressure-pipes are provided.

This pipe line plan presents no engineering difficulties or untried experiments: it is cheap, and could be completed within a year, or in say one sixth of the time necessary to complete the great Quaker Bridge dam; and we believe it should be considered before any definite conclusion is arrived at. We understand that parties are ready to contract to furnish the city with the desired amount of water from the Ramapo basin, under a pressure of 250 or 300 feet head at the city line, at a given annual rental. This might or might not be the best way for the city to get its supply; but assuredly such a proposition, especially if accompanied by an option of purchase of the water-works at a given reasonable amount, is worthy of careful consideration. The experience of our cities in work done under commissions has been so uniformly unfortunate that we may be pardoned if we believe that the cost of the proposed dam, aqueduct, lands, etc., will be, not fifteen, but thirty million dollars, and that seven or eight years will be required for its completion under the administration of any commission that will be appointed.

We would further suggest that the selection of engineers and the adoption of plans for the construction of dams, aqueducts, or pipes be intrusted to the American Society of Civil Engineers. The thorough discussion any plan proposed would receive in the meetings of that society would be of immense benefit. The high standing and honorable record of this representative society of American civil engineers would be a guarantee that the work would be not only an engineering success, but be free from the stealings and scandals with which our city and public works have heretofore been accompanied.

The question of the best method of securing a larger supply of water is by no means settled by the Commission's report, and the proposal to build the enormous Quaker Bridge dam is far too serious to be adopted with the information thus far given. The probable cost of the proposed dam and aqueduct will certainly greatly exceed the estimated fifteen millions, if the work is to be under the control of the politicians; and we would, therefore, commend to the consideration of our citizens and our legislators the plan of contracting for a supply from the Ramapo water-shed, or any other proposed plan which, like that, is based on a thoroughly successful and economical application in great hydraulic works.

CORRESPONDENCE.

[Communications will be noticed only when accompanied with the full name and address of the writer. Unless specially desired, only initials will be printed. We invite criticism and comment by the readers of the ENGINEERING AND MINING JOURNAL. Replies not intended for publication should be addressed to the Editor of the ENGINEERING AND MINING JOURNAL in blank, stamped, and sealed envelopes.]

Bessemerizing Matte in a Reverberatory Furnace.

EDITOR ENGINEERING AND MINING JOURNAL:

SIR: In your issue of March 3d is contained a description of a so-called new process in copper smelting, by Mr. Paul Johnsson, and an editorial article commending it, and stating that it is new so far as you know. This article brings out into clear relief a strange psychological phenomenon which indicates that Mr. Johnsson's brain has an unusually sensitive mechanism.

His process consists in smelting copper ores in a shaft-furnace and bessemerizing the resulting matte in a reverberatory furnace, preferably regenerative. In your issue of March 29th, 1879, page 218, I described this same process. It was there proposed to connect the shaft-furnace with the reverberatory, allowing the products of the combustion which took place in the latter to pass up through the shaft-furnace, a combination evidently evolved from a cruder plan of having the shaft-furnace separate from the reverberatory. It would be hard to believe that one could think of the plan of joining the shaft to the reverberatory if he had not first thought of the shaft-furnace fusion followed by the proposed reverberatory treatment.

Mr. Johnsson has spent several months at the works of the Orford Nickel and Copper Company, at Bergen Point, N. J., studying copper metallurgy. At that company's works, Mr. W. E. C. Eustis, the superintendent, Mr. J. L. Thomson, and myself, have carried out the process described by Mr. Johnsson in all its important details. (We are satisfied that such a process as he describes is not advisable; but we have gone farther, and found modifications which we do not care to make public, and which we do believe of value.) Much thought, time, and money have been expended on it. Details of the results obtained are on record at the Bergen Point office, as are the drawings of several furnaces, regenerative and other, for carrying out the process as described by Mr. Johnsson, as well as for other modifications of it. The workmen who carried out the details of the work are still employed there.

Now how did this process, whose details he explains with such elaboration, get into Mr. Johnsson's brain? From conversation with the workmen, foremen, superintendent, the *personnel* in general of the company at whose works it has been practically worked out? From consulting the drawings and records at its office? From conversations which he there overheard? Manifestly not; for in this case, being a young, inexperienced man, with his reputation wholly to make, he would of course have given full credit for the invention to the men who had made it, who had worked out the details by the sweat of their brows, with their own money and with their own labor; the men who had shown him most extraordinary favors in allowing him to study their unique methods of work. In preparing his article, he would have clearly pointed out that the merits of the invention belonged, not to himself, but to them. As it is, he makes no reference to them, leaving it to be inferred that the process is wholly the fruit of his own brain.

How then did it get into his brain? It must have been through the brain wave of which we hear so much. Proximity is the soul of love: why not of inventions? Through some strange, unexplained psychic force, and without his knowledge, the germs of these ideas must have entered his brain at Bergen Point; not consciously, but from the mystical contact with the spirits of those who already had the idea fully grown in their brains; by proximity to the drawings of their furnaces; by rubbing against the books in which are recorded the results of their midnight and weary toil.

We are frequently told of mediums who can tell the contents of a letter by simply pressing it against their foreheads. Probably most unconsciously Mr. Johnsson has been pressing the Orford officers and men, their furnaces, drawers of tracings, record-books, etc., against his fore-

Digitized by Google

head, or waistcoat, or whatever portion of his frame is most receptive, and mysteriously the thoughts have passed into and impregnated his brain. In brief, his ideas, thus impregnated, though born at Worcester, were conceived at Bergen Point.

Let me enumerate some of the details which Mr. Johnsson gives, and which were carried out by us years ago, passing over numerous trivial ones.

1st. The ENGINEERING AND MINING JOURNAL, 1883, page 119, line 41, Mr. Johnsson considers that the roofs of the reverberatories should be double: almost all our furnaces have been built with double roofs, to preheat the air or blast used in the furnace.

2d. *Ibid*, line 47, he advises two doors, so that two men can work at once in removing the slag. This is practiced in the Orford Company's furnaces, and indeed almost everywhere where the slag is of a consistency to make it desirable.

3d. *Ibid*, line 73, *et seq.*, he points out that the oxidation of the sulphur and iron will generate heat, and so reduce *pro tanto* the amount of extraneous fuel which will be needed to heat the furnace up to the required temperature. This was especially pointed out in my former article, and is indeed one of the chief advantages which the process offers, and whose importance we have fully tested in our numerous experiments.

4th. *Ibid*, line 49, he advises lateral removable tuyeres. Removable tuyeres were described in my former article, and we have used both horizontal and inclined removable tuyeres repeatedly, both immersed and not immersed.

H. M. HOWE.

241 BEACON STREET, BOSTON, March 8.

THE STATISTICS OF THE STEEL INDUSTRY OF THE WORLD.

M. Paul Trasenter, of Liége, Belgium, one of the most painstaking and industrious statisticians of Europe, has undertaken a work of some magnitude in endeavoring to gather the statistics relating to the steel industry of the world, and his familiarity with metallurgical subjects enables him to accomplish successfully the much more difficult task of correctly interpreting the figures which he has collected. M. Trasenter has tried to throw light upon the question whether the rapid development of the steel industry throughout the world has not assumed dangerous proportions to those engaged in it. The facts which he presents, and the conclusion which he draws from them, in a paper contributed to the *Revue Universelle des Mines*, are worthy of a careful study, because they reflect closely the condition of the industry abroad, which indirectly affects our own, and because to some extent its development there during the past decade foreshadows the course into which our own steel-makers will be forced sooner or later. They are now in fact making their first steps in that direction.

Beginning with the raw material, the yield of some of the principal sources of ore supplies in the world has been as follows, in metric tons:

SOURCES OF SUPPLY OF BESSEMER ORES.

	1879.	1880.	1881.
England, hematites	2,397,000	3,044,000	3,051,000
Prussia, spathic ores	869,000	1,009,000	1,095,000
Styria and Carinthia	542,000	.....	509,000
Sweden	642,000	770,000	.....
Bilbao, export	1,117,000	2,345,000	2,500,000
Algeria, production	418,000	614,000	.....
Elba, export	282,000	350,000	.....
Lake Superior	1,425,000	2,017,000	2,396,000

The exports from Bilbao are known to have been 1,192,000 tons greater in 1882 than in 1881. The Bessemer pig furnaces of England, France, Germany, the United States, and Belgium are partly supplied by ores shipped from Spain and from the Mediterranean, as the following table of imports of ores by sea by the various countries, being almost exclusively Bessemer ores, will show. The unit is the metric ton:

IMPORTS BY SEA OF BESSEMER ORES.

	1879.	1880.	1881.	1882.
England	1,098,000	2,675,000	2,485,000	3,330,000
France	668,000	789,000	815,000	850,000
Germany	275,000	400,000	500,000	630,000
United States	275,000	460,000	750,000	550,000
Belgium	45,000	100,000	120,000	170,000
Total	2,360,000	4,422,000	4,690,000	5,530,000

We have supplied a gap in M. Trasenter's figures relating to the imports of ores into this country in 1882, making due allowance for the estimated quantity of Canadian ores shipped by rail.

The production of pig fit for steel-making is not separately given, except in English, German, and Belgian statistics, according to which the output in 1881 was 3,110,000 metric tons in England, 886,000 tons in Germany, and 104,000 tons in Belgium. M. Trasenter estimates the make in this country at 1,400,000, in France at 450,000 tons, thus carrying the total to nearly six millions of tons of pig used for steel-making. We have, unfortunately, no means of verifying M. Trasenter's estimate of the quantity of that grade of pig produced in this country, as the statistics are not kept separately; and as the census returns on steel mix up the open-hearth and Bessemer manufacture, no deductions can be drawn from them. Besides the quantities produced in the various countries named, they received from England about 700,000 tons of steel pig, of which M. Trasenter estimates that 300,000 tons went to this country, 150,000 tons to Germany, 100,000 tons to Russia, and 100,000 tons to Belgium and France. English steel-works consumed 2,000,000 tons of pig, the rest, 400,000 tons, being required for the manufacture of special brands of iron, and notably for tin plates.

According to M. Trasenter, the production of steel ingots in the five principal producing countries in the world was as follows in 1881, the figures given being thousands of metric tons:

PRODUCTION OF STEEL INGOTS.

	Bessemer.	Open-hearth.	Crucible.	Total, 1881.	Total, 1880.	Total, 1870.
Great Britain	1,465	343	50	1,858	1,414	350
United States	1,395	133	82	1,610	1,258	64
Germany	861	125	38	1,024	762	170
France		425	8	433	426	80
Belgium	141	...	..	141	120	9
Total				5,066	3,980	673

For Austria, Russia, and Sweden, the figures for 1881 are not yet known, those for 1880 only being given:

	Bessemer.	Open-hearth.	Crucible.	Total, 1880.	Total, 1879.	Total, 1870.
Austria-Hungary	101	28	31	160	156	24
Russia	300		4	304	210	8
Sweden	30	8	2	40	28	12
				504	394	44

From this, the conclusion is drawn that, from a production of about 700,000 tons of steel in 1870, the industry has grown so that it turned out, in the whole world, about 3,525,000 tons in 1879, 4,500,000 in 1880, and more than 5,500,000 in 1881, and must have considerably exceeded 6 millions of tons of ingots and possibly reached 6½ millions during 1882.

The proportion due to works using the basic process is as yet small. In 1881, the production was about 200,000 tons, and certainly not as much as 250,000 tons, of which 120,000 tons were made in Germany. According to the statements made by the inventors, the weekly output was 30,000 tons during the beginning of the year and 47,000 tons in October, so that the total output of basic steel was not probably more than 500,000 tons of ingots, or about 8 per cent of the whole.

As for the capacity of the existing works, and those under construction, M. Trasenter furnishes the following data, from which he concludes that the steel-works of the world can easily produce from 7½ to 8 millions of tons of ingots. The number of establishments in the principal countries is:

NUMBER OF BESSEMER STEEL-WORKS.

	1878.	1879.	1880.	1881.	1882.	Building.
Great Britain	19	20	21	22	23	3
United States	10	10	11	13	15	3
Germany	13	14	16	18	19	5
France	10	10	9	9	11	6
Belgium	2	2	2	3	4	2
Total	54	56	59	65	71	19

This does not include Russia, Austria, or Sweden.

Besides the addition to the capacity by new plants, the number of converters and open-hearth furnaces has increased, as shown by the following table; and moreover the capacity of each individual plant has been steadily pushed up:

NUMBER OF CONVERTERS.

	1878.	1879.	1880.	1881.	1882.	Building.
Great Britain	61	66	78	82	84	3
United States	20	20	24	30	38	2
Germany	35	38	43	61	67	13
France	24	23	19	19	23	13
Belgium	12	12	11	13	15	4
Total	152	159	175	205	227	35

NUMBER OF OPEN-HEARTH FURNACES.

	1878.	1879.	1880.	1881.
Great Britain	100	102	126	149
United States	27	33	37	44
France	44	50	56	...
Total	197	213	249	...

Such are the means of production. Turning now to the consumption, M. Trasenter comes first to rails, and so far as the incomplete data will allow, presents the following, leaving out blooms and crucible steel, as the probable manner in which the output is divided between rails and other manufactures of steel:

OUTPUT OF RAILS AND MANUFACTURES OF STEEL.

		Rails.	Other mfs.	Total.
Great Britain,	1881	1,080	280	1,360
United States,	"	1,230	165	1,395
Germany,	"	504	316	820
France,	"	300	88	388
Belgium,	"	87	22	109
Austria,	1880	77	34	111
Russia,	"	200	65	265
Sweden,	"	2	30	32
Total		3,480	1,000	4,480

It will be noted that the total of this table falls behind the total of the production of ingots considerably—more, in fact, than waste in manufacture would seem to warrant. It is sufficiently accurate, however, to clearly show how overwhelming a proportion of the product of steel in the world goes into the manufacture of rails. A discussion of the prospects of the future consumption of rails has, therefore, a particularly striking interest. In a general way, it may be said that, in the absence of stocks, the consumption and production follow one another closely, and therefore the following table, giving the latter, pretty nearly reflects the variations in the former:

PRODUCTION OF STEEL RAILS.

	Great Britain.	United States.	Germany.	France.	Belgium.	Austria.	Russia.	Total.
1871	200	35	128	33	5	23	5	430
1872	250	86	179	82	6	38	5	650
1873	300	117	186	102	11	50	5	770
1874	350	131	237	154	21	57	5	955
1875	400	264	241	178	37	61	10	1,190
1876	470	374	253	181	58	64	15	1,420
1877	565	392	308	184	76	79	25	1,630
1878	700	508	375	231	75	80	55	2,030
1879	558	628	335	254	70	81	115	2,070
1880	810	878	407	279	75	74	200	2,725
1881	1,080	1,228	504	300	87	85	200	3,485

PRODUCTION OF IRON RAILS.

	Great Britain.	United States.	Germany.	France.	Belgium.	Austria.	Russia.	Total.
1871	1,000	668	321	123	155	90	10	2,365
1872	975	821	321	129	113	86	10	2,455
1873	750	690	387	154	122	80	10	2,190
1874	700	530	365	161	145	55	10	1,965
1875	300	454	227	119	103	40	10	1,455
1876	250	423	126	82	81	23	10	955
1877	200	301	90	60	59	18	10	740
1878	120	292	57	52	60	10	13	600
1879	70	381	34	40	39	5	6	575

PRODUCTION OF RAILS OF ALL KINDS.

	Great Britain.	United States.	Germany.	France.	Belgium.	Austria.	Russia.	Total.
1871	1,200	703	449	156	160	113	15	2,795
1872	1,225	907	500	211	120	124	15	3,105
1873	1,050	807	573	256	133	131	15	2,965
1874	1,050	661	602	315	165	112	15	2,920
1875	900	718	469	297	140	101	20	2,645
1876	720	797	380	263	140	87	25	2,415
1877	765	693	398	244	135	97	35	2,370
1878	820	800	432	283	135	90	68	2,630
1879	630	1,009	370	294	109	86	151	2,645
1880	980	1,325	452	321	139	77	155	3,500
1881	1,230	1,670	530	328	132	87	155	4,185

As these tables show, iron has declined very rapidly in importance as a raw material for rails, the quantities manufactured in and for this country elsewhere alone keeping it from dropping into utter insignificance. The year 1882 will witness a sharp decline, and after 1883 it will probably be of no practical importance.

The annual consumption of rails in the world during the last decade has fluctuated between 2,350,000 and 4,150,000 tons. M. Trasenter, on the basis of the new mileage constructed during the past decade, has calculated the consumption for that purpose in the world, leaving the remainder for minerals. He holds, however, that in many cases the rails are really only laid a year after they have been made, and in a table gives the amounts used for renewals, arrived at by assuming the rails to have been laid in the year they were made (column A), and when made during the preceding year (column B). The following is the result of his labors:

CONSUMPTION OF RAILS.

	Total.	New roads.	Renewals. A.	Renewals. B.
1871	2,795	1,490	1,305	....
1872	3,105	1,220	1,885	1,575
1873	2,965	1,160	1,805	1,945
1874	2,920	960	1,960	2,015
1875	2,640	970	1,670	1,940
1876	2,415	930	1,485	1,710
1877	2,370	940	1,430	1,475
1878	2,630	830	1,800	1,540
1879	2,645	1,080	1,565	1,550
1880	3,500	1,200	2,300	1,495
1881	4,185	1,510	2,675	1,990

M. Trasenter makes a good point when he calls attention to the fact that an order for new construction means much more business to iron and steel industries than an order for the same quantity for renewal. In the former case, the equivalent of pig, etc., must be provided; while in the latter case, by the throwing upon the market of a given amount of old material, the furnace-man has a chance to provide only for that fraction of the whole which goes to make up the loss in manufacture. M. Trasenter has very carefully gone into the question how fast the wear of rails is, and what is the quantity of iron and steel rails in the tracks of the roads of some of the principal countries. He has reached the following results:

RAILS IN THE TRACKS OF SOME OF THE PRINCIPAL COUNTRIES.

	Iron.	Steel.
Great Britain	1,980,000	2,400,000
Germany	2,550,000	1,570,000
Belgium	265,000	255,000
Russia	800,000	900,000
Austria	930,000	730,000
United States	7,000,000	5,000,000
Other countries	4,000,000	2,600,000
Total	19,000,000	15,200,000

M. Trasenter figures out the time which the replacement of these rails will take. He concludes that the mean age of the iron rails in use on January 1st, 1882, was about ten years. The mean age of the steel rails in use at the same date he sets down at something over four years. As to the wear of each class, he takes figures showing the movement of traffic by weight only, and allows a mean of twenty years' duration for iron rails and ninety years for those of steel. Allowing for the gradual decrease of the number of iron rails in the tracks, M. Trasenter roughly estimates the renewals of 1882 at 1,900,000 tons, of 1883 at 1,710,000, 1884 at 1,540,000, and so forth, in a steadily decreasing ratio. Experience in this country has shown that there is no regularity in this process of replacement of old iron by steel, financial reasons often delaying such for years and accumulating orders for many years, to be let out upon the works of the country with a sudden rush. European roads have but little to hope from this source, as nearly one half of the iron rails now in the track are laid in this country. As to the renewals of steel by steel, M. Trasenter seems to us to take rather a gloomy view, giving them a wonderful longevity, and naturally, therefore, estimating the quantity annually thrown out of the track very low, or only one half of one per cent. We believe that the tendency so clearly exhibited, at least in this country, to increase the capacity of the cars, will soon make itself felt on the lighter steel rails laid years ago.

As to the requirements for new roads, statisticians must of course be almost entirely at sea, except in those countries where the railroads are built by the government. Still the following averages of past work in millimeters for the period of 1871–1881 is of interest.

NEW MILEAGE IN THE WORLD.

	1871–1881.	1880–1881.
Great Britain	450	500
Germany	1,325	500 (?)
Belgium	102	85
France	590	1,500
Russia	970	1,000 (?)
United States	7,160	17,600
Other countries	5,435	8,000

M. Trasenter reaches the conclusion that the consumption of rails in the world has reached its maximum, and that, even if it should be maintained, it will be kept up only for a small number of years, and that will only hasten the time when iron rails will be completely replaced. In the face of this, the production of the steel-works goes on developing so that a crisis can only be avoided by an extension of the other uses of steel. To the problem how far progress is possible in this direction, M. Trasenter turns his attention.

One of the great controversies among metallurgists, builders, and engineers to-day turns on this very subject, and the magnitude of the interests involved accounts for the persistency with which every point concerning the adaptability of steel to purposes for which iron is used is fought.

How great a field there is for steel in rolled metal, bars, track material, sheet wire, and forgings, is shown by the following table, in which the output of rolled open-hearth and Bessemer steel and wrought-iron other than rails, is approximately given:

	Steel.	Iron.
Great Britain, 1881	280,000	2,100,000 (?)
United States, "	165,000	1,955,000
Germany, "	316,000	1,325,000
France, "	88,000	990,000
Belgium, "	27,000	435,000
Austria-Hungary, 1880	35,000 (?)	200,000 (?)
Russia, "	60,000	294,000
Sweden, "	30,000	250,000
Total	1,000,000	7,550,000

The progress in Germany is striking. In our own country, the use of Bessemer steel for merchant purposes is just beginning, and is destined, we believe, to experience a rapid development. Unfortunately, full statistics of the work of the rolling-mills is given only in Germany and Belgium, so far as railroad material is concerned. In 1881, the product in Germany was distributed as follows:

	Iron.	Steel.
Ties	52,000	27,600
Frogs, etc	13,000	18,600
Springs	1,300	16,500
Wheels	3,800	27,000
Tires	10,300	32,700
Total	80,400	122,400

So far as springs and tires are concerned, steel has come out the victor in the struggle with iron, Belgian works having made 11,000 tons, Austrian establishments 10,000 tons, and British steel mills 50,000 tons, the entire product of the world approaching 200,000 tons.

In the manufacture of merchant bar, steel has as yet made little headway. In 1881, Germany produced 712,000 tons of iron and 13,000 tons of steel, while Belgium turned out 310,000 tons of iron and only 8000 tons of steel, the proportion probably being similar in other countries, if not considerably less favorable to steel. While the question of price may to some extent account for this, the principal cause probably lies in the fact that there is such a difference in working iron and steel. When it becomes necessary to forge, weld, or punch, steel presents difficulties and requires precautions which do not accord with the routine of the workmen, and oppose the prejudices of consumers; and the use of steel in bridge-building, car construction, etc., is developing slowly, while for general purposes it has scarcely begun.

For boiler and ship plates, the position is largely the same. M. Trasenter estimates the relative proportions of iron and steel in the product of some countries as follows:

	Iron.	Steel.
Germany	194,000	5,000
England	800,000 (?)	100,000
France	163,000	18,000
Belgium	105,000	2,000

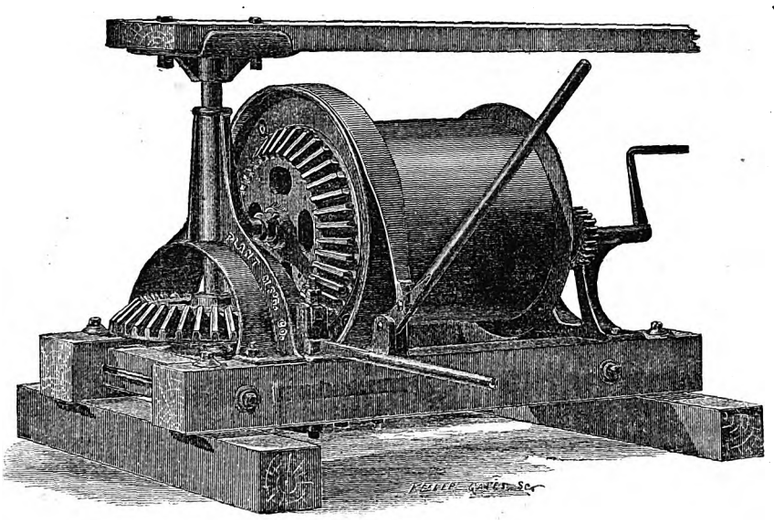
M. Trasenter seems to have paid little attention to an important field for steel, which, it is true, is as yet confined to England. We refer to the higher grades of tin plates. It is pretty well understood that "charcoal" plates are more and more becoming a myth, and steel tin plates are now made quite extensively, with every prospect of gaining rapidly in the good graces of consumers. We have seen articles stamped and spun from such plates, which have a wonderful ductility, approaching copper.

One of the greatest advances made by steel during the past few years, notably in this country, has been in the use of wire. Unfortunately, no figures are as yet available to reflect the progress made. We have, however, full data from Germany, one of the greatest wire-producing countries, according to which the make of iron wire increased from 222,000 tons to 233,000 in 1881, while the production of steel jumped in the same period from 10,800 to 58,600 tons.

For machine, cannon, and other forgings, steel is rapidly displacing iron; but, so far as tonnage is concerned, the market is limited though valuable, on account of the high prices realized, few works having the necessary plant of special and heavy tools to produce such articles. We believe that the casting of such articles, to which much attention has been paid in this country, offers a means of avoiding such heavy outlay of capital, and thus will make it possible for steel to step into the field as a formidable competitor, with greater chances of success.

Summarizing the points brought out in his discussion of the subject, M. Trasenter concludes that steel tends to monopolize the market for railroad materials, but has now little to gain in that direction. The manufacture of wire and ship-building afford a growing market; but so far as plates, sheets, and merchant bar are concerned—the most important outlet for iron rolling-mills—the part played by steel thus far is unimportant. Efforts have been made for a number of years; but consumers are slow, and decline to indorse the condemnation of the puddling-furnace, so frequently pronounced by metallurgists. This is due, as has been already stated, to difficulties and novelty in manipulation and to the heavy difference in price. For a large number of uses, the lessening of weight and the greater resistance to wear are not as evident as with ship-plates or rails; and iron, therefore, fully meets the requirements. The production of small ingots, or the working down of large ones, tells against the use of Bessemer steel for such purposes, and the scrap is not as easily worked up as wrought-iron scrap. Raw materials of high grade must be used; and while the basic process has removed this obstacle, the greater cost of production to a large extent counterbalances the advantage thus gained.

Theoretically, the Bessemer process is cheaper, the waste is less, particularly in reheating, the consumption of fuel is materially reduced, and the cost of labor is lower. On the other hand, the general expenses and the cost of refractory materials are higher. Still, few steel-works would be willing or able to produce weight for weight at the same price. A decline in values of steel made by modern processes is imminent throughout the producing countries, if steel-makers do not succeed in finding consumers who are willing to consider the high quality, and pay accordingly. It is the duty of producers of steel to study and make known the high quality, and to watch closely that the metal which they furnish is well adapted to the uses to which it is to be put. This is the only means which they possess to avoid the effect of the decline in prices which must, sooner or later, result from the excess of the producing capacity over the requirements of the market for rails. The production of wrought-iron is so great, and its uses so numerous, that there are many branches in which steel may claim and conquer a market.



AN IMPROVED HORSE-POWER HOISTING-GEAR.

For the many purposes of engineers and contractors, and for quarries and mines, particularly in prospecting-work, a handy horse-power hoisting-gear is urgently required, the crude rigs with which work is often attempted entailing a loss of time and a waste of power and of money out of all proportion to the saving in first cost. We present, in the accompanying engraving, a general view of a hoisting winch designed by the Contractors' Plant Manufacturing Company, of Buffalo, N. Y., with patents taken out, we believe, by Mr. A. Dobbie. The design shown is specially adapted for derrick work. For mining purposes, where it is desired to hoist smaller weights, say from 300 to 500 pounds, at a speed of about 75 feet per minute, the drum gear-wheel is correspondingly smaller, and the driving-gear larger, the number of teeth being 18 and 45. The general features, however, are the same. The drum, which is 23 inches long and 21 inches in diameter, is moved by means of the gear-wheels shown by the power applied to the boom. The vertical shaft of the driving-gear can be lowered by raising the left-hand lever, so that the gear-wheels can be made to engage or can be put out while the horse is in motion. A gearing attachment at the other end of the drum is provided to take up the slack rope by hand, and a powerful strap-brake can be applied whenever necessary, so that the person working the hoist has full control of the entire machine, which in all weighs 1000 pounds, and has a bed-frame 5 feet 3 inches by 2 feet 9 inches, its total hight being 2 feet 10 inches. The shafts are cast-steel, and the only parts made of wood are the sills and the sweep.

GOLD IN NEW SOUTH WALES.

By Harrie Wood, Under-Secretary of Mines, Sydney.

Mining for gold in Australia commenced in the year 1851, but the discovery of gold is recorded as far back as 1823. Mr. Surveyor McBrian, in his field-notes of the survey of the Fish River, between Tarana and O'Connell, states, "February 15th, 1823. At 81·50 to river, and marked gum-tree. At this place I found numerous particles of gold in the sand in the hills convenient to the river."

In 1839, Count Strzelecki found auriferous pyrites.

In 1841, February 23d and 24th, Rev. W. B. Clarke, M.A., F.R.S., discovered gold *in situ* in the granite formation between Hartley and Hassan's Walls, and at the head of Winburndale Rivulet. He very shortly afterward spoke of the abundance of gold likely to be found in the colony, and as early as 1843 mentioned it generally. In 1844, he showed a sample to the Governor of New South Wales, Sir George Gipps, who said, "Put it away, Mr. Clarke, or we shall all have our throats cut."

Professor Geikie, Director of H. M. Geological Survey of Scotland, in his *Life of Murchison*, thus refers to Mr. Clarke's discovery of gold: "The first explorer who proclaimed the probable auriferous veins of Australia on true scientific grounds, that is, by obtaining gold *in situ* and tracing the present rock through the country, was the Rev. W. B. Clarke, M.A., F.R.S., who, originally a clergyman in England, has spent a long and laborious life in working out the geological structure of his adopted country, New South Wales. He found gold in 1841, and exhibited it to numerous members of the legislature, declaring, at the same time, his belief in its abundance. While, therefore, geologists in Europe were guessing, he, having actually found the precious metal, was tracing its occurrence far and near on the ground."

In 1843 or 1844, Macgregor, a shepherd, is said to have found gold in the Wellington District.

In 1844, Sir Roderick Murchison, from an examination of a collection of rock specimens from Australia, pointed out the resemblance of the Australian mountain chain to that of the Ural. "But," he says, "it so far differs from the Ural and many other meridian chains in having as yet offered no trace of gold or auriferous veins." But, in 1846, he writes, "I now learn, however, that fine specimens of gold have been found in the western flank of the Australian cordillera, particularly at the settlement of Bathurst, where it occurs in fragments composed of the same matrix (namely, quartz-rock) as in the Ural. My friend and associate at the Imperial Academy of Petersburg, Colonel Helmersen, has recently suggested that a careful search for gold in the Australian *débris* will, it is highly probable, lead to its detection in abundance; I therefore encouraged the unemployed miners of Cornwall to emigrate and dig for gold." Sir Roderick also stated that, in the year 1848, a resident in Sydney (Mr. T. W. Smith), who had read what he had written and spoken on the point, had sent him specimens of gold ore found in the Blue Mountains. This was probably the person referred to in the official dispatch from Sir C. A. Fitz Roy to Earl Grey, dated June 11th, 1851: "About two years ago, a Mr. Smith, who was engaged in some works near Berrima, produced to the colonial secretary a lump of gold imbedded in quartz, which he said he had picked up at a certain place, which he offered to make known to the government upon being previously rewarded for the intelligence by the payment to him of a large sum. The obvious reply to this offer was, that the government could enter into no blind bargain on such a subject; but that if Mr. Smith thought proper to trust to the liberality of the government, he might rely upon being rewarded in proportion to the value of the alleged discovery, when that was ascertained. Mr. Smith refused to accede to this proposal, and there the matter rested."

In 1849, a shepherd-boy was reported to have found a nugget of gold in the Pyrenees (Victoria).

On April 3d, 1851, Mr. E. H. Hargraves, who had recently returned from California, addressed a letter to the colonial secretary, stating that he had been prospecting for two months, and offered to point out the localities in which he had discovered gold to any officer of the government on condition of the government awarding him the sum of £500 as a compensation. To this the government directed that an answer should be given similar to that returned to the former proposal of Mr. Smith.

On the 30th April, Mr. Hargraves replied that he was satisfied to leave the remuneration for his discovery to the liberal consideration of the government, and named the localities where the gold would be found. The localities named by Mr. Hargraves were "Lewis Ponds and Summer Hill Creeks, Macquarie and ———— rivers, in the districts of Bathurst and Wellington."

Mr. Hargraves was requested to place himself in communication with Mr. Stutchbury, Government Geologist, who was instructed to inspect and report. This Mr. Stutchbury did on the 14th May, confirming the news of the discovery. It appears that in the first instance Mr. Hargraves, in company with Mr. John Lister, discovered gold—about five grains—on February 12th, 1851, at Lewis Ponds Creek, within two miles of Ophir. The Messrs. Lister and Tom were then instructed by Mr. Hargraves how to wash for gold, and after prospecting for some time, they at last, in April following, discovered payable gold at Fitzroy Bar, now called Ophir. The discovery being made known, persons of all classes flocked to the place, and soon proved the occurrence of extensive auriferous deposits in the beds of the creek and in the alluvial flats in the locality, and thus the first gold-field in Australia sprang into existence. Referring to this, Mr. Stutchbury reported—on May 25th, 1851—that at the diggings at Summer Hill Creek, upon an extent of about a mile, there were not less than 1000 persons, many of them getting large quantities of gold, the heaviest lump then found being four pounds in weight.

Prospecting operations were immediately directed to other districts throughout the colony, and many of our principal gold-fields were opened up during this year. The district of Port Phillip, now called Victoria, was separated from New South Wales on July 1st, 1851; and a few weeks after that date the Ballarat, Mount Alexander, and other Victorian gold-fields were discovered. Similarly, the opening of the gold-fields in Queensland occurred about the time—1859—of the severance of that territory from New South Wales. The gold production of those colonies, therefore, is not included in the returns of the quantity of gold raised in New South Wales. Since 1851, when our auriferous deposits were first worked, the quantity of gold raised, so far as can be ascertained, has been 9,225,179 ounces, valued at £34,343,857. The number of gold miners in the colony in 1881 is estimated at 7556, but many of them are only occasionally engaged in mining.

The distance between the Albert gold-field and the Delegate gold-field being 672 miles, and between the latter and the Ballina gold-field being 600 miles, it will be seen that gold-fields are distributed over the greater part of the colony. Notwithstanding that the search for gold has been carried on for thirty years, new fields or new deposits are continually discovered, some of them in localities which were supposed to have been thoroughly examined. Some of the fields recently discovered promise to equal in extent and richness any discovered in the early days; while our oldest fields, though apparently exhausted as far as the miner unaided by capital and skill is capable of exhausting them, yet contain deposits of gold which will yield a rich harvest to the skilled miner who shall bring to bear upon them appliances such as are successfully employed elsewhere. In order to encourage the introduction of such a system of mining as will lead to the profitable working of localities from which the operative miner can no longer extract a living by means of the pick and shovel alone, it will be necessary to provide security of tenure over comparatively large areas subject to the employment of necessary appliances and labor.

Gold has always been found in association with certain formations, and the extent of country occupied by these is about 70,000 square miles—or nearly one fourth of the whole area of the colony—a considerable portion of which has not yet been touched by the pick of the miner. Gold-bearing quartz reefs have been found in New South Wales in sedimentary rocks of Upper Silurian, Devonian, and Carboniferous ages; also in hornblendic granites, porphyry, diorite, and serpentine; while the deposits which contain alluvial or water-worn gold in payable quantity, and which have been derived from the degradation of these formations, are of Permian, Cretaceous, Tertiary, and Quaternary ages.

Auriferous quartz reefs in the Upper Silurian formation have been worked at Hill End and Tambaroora, Trunkey, Temora, Mount Brown, etc.; in the Devonian, at Nana Creek, Boorook, etc.; in the Carboniferous at Barrington or Copeland; in hornblendic granites, at Braidwood, Adelong, etc.; in porphyry, at Grenfell; in diorite, at Gulgong, Temora, Parkes,

Digitized by Google

etc.; in serpentine, at Gundagai, Lucknow, etc. The reefs vary from a few inches to ten feet in width, though occasionally they attain a greater thickness. They generally have a meridional strike, especially where they traverse the Silurian formation; but in many localities, the strike runs in other directions. Thus at Hill End, Trunkey, and Adelong, the prevailing strike is about N. and S.; at Dalmorton, from E. 10° N. to E. 30° S.; at Grenfell, N.E.; at Temora and Copeland, from N.E. to E. and S.E.

In these reefs, the gold seldom occurs without one or more of the following sulphurets: Pyrites, galena, mispickel, blende, and copper pyrites; calcite is also frequently present, and barytes rarely. At Hill End, portions of the reefs contain potash mica (muscovite). "In some places, the mica was found to entirely replace the quartz, and here the gold was found to be excessively rich."* These reefs traverse chlorite slate, clay slates, and metamorphosed conglomerates; the latter contain obscure impressions of *encrinites*, *spirifera*, and *favosites*.

The rich quartz veins at Lucknow occur along the line of junction of serpentine and hornblende porphyry; besides quartz, the vein-stuff includes calcite, asbestos, serpentine, and abundance of mispickel, also a little magnetite; the gold is sometimes visibly disseminated through the mispickel and serpentine.† At Barmedman, in the Bland District, and at Cowarbee, in the Murrumbidgee District, gold is not only found in the veins of quartz with pyrites and galena, but also in the cleavage planes and joint-fissures of the adjoining slates. Near Glen Innes, in the New England District, it has been found in bismuth ores. At the Brown's Creek mine, six miles west from Blayney, an immense breccia lode has been worked for many years. The gold is disseminated in fine particles throughout the lode, and also in hard siliceous accretions, which have been formed by segregation in the lode stuff; the gold, therefore, has evidently been deposited from solution. The lode has been extensively worked, and yields an average of about three dwts. of gold per ton. A quartz reef near Braidwood contains gold, cobalt, iron pyrites, copper pyrites, blende, and galena. On several of the gold-fields, the reefs contain much pyrites, which, on assay, have been proved to be more or less rich in gold. New South Wales doubtless affords a very promising field for the introduction of efficient appliances for the extraction of gold from pyrites. A high yield of gold has, in some cases, been obtained from the silver lodes of Boorook, the ores from which consist of chloride and sulphide of silver, with a little iodide of silver.

Throughout the gold-fields, gold is always found to be more or less alloyed with silver, and occasionally with traces of copper, iron, osmo-iridium, and other metals.

The greatest depth at which auriferous reefs have been worked in New South Wales is 940 feet, namely, in the Adelong United gold mine, Adelong.

At Araluen, Uralla, the Granite Diggings, near Mount Brown, and other diggings where the formation consists of granite, the gold in the alluvium has evidently not only been derived from quartz reefs, but also from the granite rock itself.

Near Rockley, gold occurs in altered talcose schists.

The greater proportion of the gold hitherto raised has been from alluvial deposits. These, as before mentioned, are of Permian, Cretaceous, Tertiary, and Quaternary ages.

The Permian deposits consist of pebble conglomerates forming the base of the Coal Measures, or "*Glossopteris beds*," at the Tallawang Diggings, and resting upon Silurian schists traversed by quartz reefs from which the gold must originally have been derived. The conglomerate yields from 1 to 15 dwts. of gold per ton, while nuggets weighing 5 ounces have been obtained from it. The gold is generally in the form of flat scaly pieces, and water-worn.

Gold has been recently discovered in the marine conglomerates and shale beds, which are believed to be of Cretaceous age, and which rest upon the flanks of the Silurian, Devonian, and granite formations in the Mount Brown or Albert gold-fields.‡ It is probable that these marine beds will only be found payably auriferous where they fill hollows or "gutters" in the surface of the older formations.

Of the Tertiary deposits, gold in payable quantity has been obtained from the Lower, Middle, and Upper Pliocene alluvia, chiefly from the two latter. These are of fresh-water origin, and consist of ancient river drifts of pebbles, sand, and clays, the remains of auriferous formations which had been disintegrated by denuding agencies during the erosion of the valleys. "The fossils found in these fluviatile deposits or 'deep leads' of the Middle and Upper Pliocene beds are very numerous. Large trunks, branches, leaves, and fruits of trees, with ferns, bones of extinct marsupials and birds, remains of insects and fresh-water mussel-shells, have been exhumed from the clays and gravels of these old river-beds. Of the fossil fruits, Baron von Mueller, K.C.M.G., M. and Ph.D., F.R.S., the distinguished Government Botanist of Victoria, whose researches have thrown so much light upon the character of the vegetation of this period, has described no less than thirteen genera and sixteen species of extinct forms, some of which have living allies. It is worthy of remark that in Australia the Upper Pliocene is the oldest formation in which the *Eucalyptus* has been discovered; it would therefore appear that this genus, which now includes the principal forest-trees of Australia, is, geologically speaking, of comparatively recent introduction on the continent.

In many localities, the old river-beds, or "leads," as the miners term them, have been overwhelmed by flows of volcanic rocks which are sometimes 200 feet thick; consequently shafts have to be sunk through the basalt, as on the Forest and other gold-fields, to reach the gold-bearing gravels; but where, as on the Cudgegong River, etc., the basalt has been completely cut through by the subsequent erosion of the valleys, the leads may be readily worked from adits driven under the basalt.

From 1546 loads of wash-dirt from one of the rich claims (four men's ground) on the Happy Valley lead, near Gulgong, 6203 ounces of gold were obtained; and from a claim on the Canadian lead, on the same gold-field, seven men in three years obtained, free of all expenses, gold to the value of £28,000. One ounce of gold per load, though above the average yield, is not an uncommon return from the wash-dirt of the Pliocene leads. Such leads are at the present time (1882) worked within the Temora gold-field, where the depth of sinking before reaching the auriferous drift varies from about 30 feet to 200 feet. But upon the Gulgong, Parkes, Forbes, and other fields of gold-bearing fame, some of the leads have been followed into deep ground, where, owing to the heavy influx of water, they could not be further profitably worked by the ordinary manual efforts of the miners. However, with the aid of steam power and improved gold-saving appliances, they will probably afford remunerative employment for many years to come.

The Quaternary or Post-Pliocene and recent gold-bearing drifts are found in all the alluvial flats through which the rivers and creeks meander, and in the more shallow ground, or "surfacing," upon the sides and summits of the hills, in proximity to the rocks and reefs from which the gold has been derived. On many of the gold-fields these deposits proved immensely rich, and on account of the facility with which they could be worked, by even inexperienced miners, they were quickly exhausted, excepting in localities where water was scarce; and there are many such places where the surfacing will pay to re-work by ground-sluicing when a sufficient supply of water can be brought to operate upon it.

On the Mount Brown gold-field, in the northwest part of the colony, where there is a scarcity of water, owing to the aridity of the climate, large quantities of gold have been obtained from the alluvial by dry-blowing, which is a tedious and troublesome process for the miners. Latterly, however, two patents have been taken out—one by Messrs C. Phillips & Co., and the other by Captain Park—for inventions of dry-blowing machinery for treating dry and loose gold-bearing deposits: the recent public trials of these machines proved successful.

Taking into consideration, therefore, the above-mentioned deposits not yet worked out, together with the large extent of country occupied by formations of an auriferous character awaiting the search of the prospector, gold mining in New South Wales may be regarded as an important and permanent industry.

H. C. Shaw	10.00		

THE STEEL CRUISERS.

The Naval Advisory Board has submitted to the Secretary of the Navy the following recommendations for the 3000-ton steel cruisers, the building of which was authorized by Congress last summer: The principal dimensions of the hull should be: Length between perpendiculars, 270 feet; extreme breath, 42 feet; mean draught, 16 feet 6 inches; displacement in sea-water, 2950 tons. The ship should have an open or single deck, with poop and forecastle. The battery should consist of nine 6-inch rifles, two of which should have a direct head-fire, and one a direct stern-fire. Ports and guns should be so arranged as to admit of fighting five 6-inch guns in each broadside. The board reserves the arrangement and character of the battery for future consideration, the weight of the ordnance not to exceed 170 tons. The allowance of 28 tons should be made from the weight of ordnance for machine guns, torpedoes, and electric gear. In the opinion of the board, wood casing and metal sheathing are

neither necessary nor desirable, and hence the board recommends that they be not fitted. The bow should be of a modified ram shape, and, while not intended to develop full ram power, it should possess a greater strength than is applied to ordinary types of unarmored cruisers. A double bottom should extend throughout the entire space occupied by the machinery and transverse coal-bunkers. It is the opinion of the board that a steel deck, 1½ inches in thickness, should be fitted over the space occupied by the boilers and machinery, the outer edges to be about four feet below the load line. The magazines and shell-rooms should be inclosed by water-tight bulkheads, and covered by a protective flat three fourths of an inch in thickness. To have no main projecting keel, but bilge keels extending well fore and aft. The vessel should be bark rigged to topgallant sails. The area of the plain sail should not exceed 12,600 square feet. All main water-tight transverse bulkheads to extend to upper deck. To have a complete system of drainage, consisting of two large main drain-pipes, one on either side of the vertical keel in the double bottom, and connected with a stand-box in each main compartment, which shall contain valves and sluices open by rods led to the gun-deck. The valves in the drains to be so arranged that water can be drawn from each compartment, and the full pumping power concentrated on any compartment; sluice-valves and water-tight doors in all water-tight bulkheads, including coal-bunkers, shall be arranged to work both from below and from the berth-deck; the ships should have single screws operated by horizontal cylinder engines placed in separate water-tight compartments beneath, and thoroughly protected by the steel deck; the boilers should be cylindrical, and with internal furnaces, to be in at least two distinct groups in water-tight compartments; the draught should be forced by means of a closed fire-room, a pressure above the atmosphere to be maintained in it by means of blowers.

THE MINERAL STATISTICS OF SPAIN FOR 1880.

The official figures for the production of the mines of Spain have just been published for the year 1880, as follows, in metric tons:

	Production.	Export.
Iron ores	3,565,338	2,932,998
Lead ores	290,047	12,513
Argentiferous lead ores	30,852	.....
Silver ores	29,998	.....
Copper ores	1,476,209	501,425
Zinc ores	50,531	36,415
Quicksilver ores	26,336	.....
Manganese ores	5,034	11,552
Rock-salt	17,238	.....
Sulphate of soda	6,340	.....
Sulphur	30,281	.....
Phosphates	24,713	19,486
Coal	825,790	.....
Lignite	21,338	.....

It will be seen, therefore, that the bulk of the iron and manganese ores, the greater part of the zinc ores, chiefly calamines, almost all the phosphates, and a large share of the copper ores, probably almost exclusively pyrites, were exported. The number of men employed in the mines of Spain was 59,905, and 372 engines, rated at 8893 horse-power, were at work.

Spanish works produced in the same period the following quantities, of which the annexed amounts were exported:

Tons.	Production.	Export.
Pig-iron	85,939	3,725
Wrought-iron	49,021	41
Pig-lead	68,437	46,492
Argentiferous lead	11,371 (?)	45,907
Copper	23,675	20,939
Zinc	4,221	2,094
Quicksilver	1,387	1,099
Silver, kilograms	65,871	.....

There is evidently something wrong in the statistics of the production of lead, as the exports show a much larger amount than the make. Of the two, the former figures appear to us far more worthy of belief, as in 1879 the export footed up to 100,336 metric tons: 41,371 tons seem much more likely to be true than 11,371 tons.

FLANGING STEEL PLATES COLD.

Messrs. Easton & Anderson have communicated to the British Institution of Mechanical Engineers the results of an interesting series of experiments on flanging steel plates cold by hydraulic pressure. A pair of molds were made to fit an hydraulic press, capable of exerting a pressure of about 250 tons. They were so shaped that at one operation they would make a flange both on the outside and inside of an annular steel plate, and thus produce a double-flanged annulus. A taper was given to the molds, to facilitate the removal of the plate after flanging. There was a slight hollow, ⅛ inch deep, formed on the annular face of the upper mold, and a corresponding rounding on the lower one, to flatten the face of the plate. Experience showed that in this mold, and also in the second mold, a depth of $\frac{1}{16}$ inch would have been sufficient. The plates were Landore Siemens S.S. qualtity, ⅜ inch thick. Their edges were beveled in the lathe, to an extent of ¼ inch in thickness on the inside and $\frac{1}{16}$ inch on the outside edge; after flanging, a slight bevel suitable for calking still remained. Both the outside and inside circles were cut out in the lathe. These first molds not proving altogether satisfactory, they were altered in shape, and turned on the working faces. The first plate was successfully flanged cold, with a pressure of about 250 tons. In the second plate, a little deeper flange was attempted, but it cracked on the inner flange. A plate of S. flanging quality was then annealed and tried cold; but it cracked in six places on the inner flange. A similar plate not annealed also cracked, but in one place only. Some more S.S. plates were then ordered, specially for this work, and were flanged cold and unannealed. The first one cracked in the inner flange; but this was probably due to an attempt to get a very deep flange, standing up about $2\frac{9}{16}$ inches from the under side of the plate; the next, with a flange of about 2⅜ inches deep, did not crack. The third cracked at the bend of the external flange, on the outside, showing a crack about three inches long nearly through the plate. A plate annealed for about four hours, and pressed when cool enough to be held in the hand, cracked badly at the inner flange. Two others annealed for about sixteen hours turned out quite sound. A batch of twelve, heated in a plate-furnace and cooled in ashes for forty-eight hours, were then flanged with perfectly satisfactory results, there being no sign of cracking even on the inner edge of the hole, where the best unannealed plates had shown slight signs of skin cracks, started, no doubt, by the roughness of the sharp edge. Another lot was annealed for about sixteen hours; but having had a thick layer of ashes over them, they were still warm when pressed. Out of four which were flanged two cracked, one slightly on the inner edge and one very badly. The rest of these were put back to be carefully re-annealed, and twelve out of the fourteen were sound. In all these annealed plates, the actual duration of the flanging process in the mold had been very short, from one quarter of a minute to half a minute. Another lot of 21 plates, thorough annealed, were now flanged, allowing the operation to extend over about 3½ minutes; and at the same time, the ragged edge round the hole was carefully filed off, so as to give no starting-place for a crack. The result appeared to be satisfactory, as only two cracked, and those not badly. The approximate thickness of the edge of the external flanges was $\frac{13}{16}$ inch, showing an increase of $\frac{1}{16}$ inch; that of the internal flange was $\frac{5}{16}$ inch, showing a reduction of $\frac{1}{16}$ inch. The average pressure required for the annealed S.S. plates was about 200 tons. It would seem, as a general result, that for cold flanging, involving compression only, as on the outer flange, these plates, even of the lower or S. quality are perfectly trustworthy, even unannealed; as only in one case did a crack appear in the external flange. But for flanging involving considerable stretching of the material as on the inner flange, only S.S. quality will do at all, and the slightest irregularity in the metal will cause a crack. The results showed that this might be expected in from 10 to 15 per cent of the plates.

PROGRESS IN SCIENCE AND THE ARTS.

Iridium Plating.—Mr. W. L. Dudley has announced before the Ohio Mechanics' Institute that the problem of electro-plating with iridium has been solved by employing a suitable solution of the metal and properly regulating the electric current. The solution is kept at uniform strength by using a plate of iridium as the anode. The metal is deposited in the reguline state, and takes a good polish. A buffing-wheel that will grind off nickel plating in a few moments only serves to polish the iridium. Thin platinum foil, coated with iridium, retains its flexibility; and if the coating is not too thick, it will not readily scale off. Copper plates for engravings, faced with iridium, would possess marked advantages over steel engravings.

The Transmission of Sound through Rock.—Some very interesting observations have been made in the course of mining work in the Hartz Mountains, Germany, on the distance through which sounds are transmitted in rock, the latest facts relating to the subject being recorded by Herr F. Schell, of Grund, in the *Zeitschrift für das Berg-, Hütten- und Salinen-Wesen*. In a horizontal direction, the firing of shots at the face of a cross-cut has been heard in a cross-cut driven toward it, the face of which was 447 feet distant from it. Until recently, however, no occasion has presented itself to observe how far sound was transmitted in a vertical direction. A level was driven on a vein at a depth of 538 feet below the surface, and happened to strike 187 feet distant in a horizontal direction below a stamp-mill dropping stamps weighing 330 pounds. The dropping of the stamps on the surface could be distinctly heard in the heading below, which in a direct line, the hypothenuse of a right-angle triangle, was separated by 571 feet of rock.

Coating Steel with Copper.—Experiments are at present carried on in Belgium to preserve steel, and steel gun-barrels in particular, by coating them thinly with copper by a process of which M. F. Weil is the inventor. Its peculiarity consists in the composition of the baths used, in which the usual and always dangerous cyanides of the alkalies are replaced by organic acids and glycerine. According to M. Weil, these baths require no renewal of organic elements, and can be used continuously when they are saturated with peroxide of copper. They possess, also, the advantage, owing to the property inherent in organic alkaloids of dissolving the peroxide of iron without attacking the metallic iron itself, of cleansing the steel before the commencement of the coppering process, and more perfectly than can be done mechanically. The coppering is effected by putting porous clay vessels filled with caustic soda lye, in which zinc plates have been immersed, in the basin containing the organic copper base (alkaloid) and the steel. The zinc plates are connected by a thick copper wire with the steel articles to be coated with copper. The caustic lye may be used over and over again. Should it become saturated with oxide of zinc, it is sufficient for its regeneration to treat it with sulphide of sodium, when the oxide (of zinc) will be precipitated and a by-product obtained, by which the cost of the process will be considerably reduced. The coppering process, it is said, occupies but a very short time.

Electrolytic Estimation of Zinc.—An abstract of a paper by A. Millot was given in a recent number of the *Journal* of the Chemical Society. According to the author, the process is as follows: 2·5 grams of the mineral are dissolved in 50 c.c. of hydrochloric acid, and a small quantity of potassium chlorate is added to the boiling solution in order to precipitate the iron. If the mineral contains much silica, it is previously evaporated to dryness with hydrochloric acid. The liquid is cooled, diluted, and mixed with 100 c.c. of ammonia, and 50 c.c. of a saturated solution of ammonium carbonate, in order to precipitate the lead and calcium. The liquid is diluted to 500 c.c., filtered, and 100 c.c., corresponding to ·5 gram of the mineral, and containing from ·2 to ·3 gram of zinc, are mixed with 1 gram of pure potassium cyanide and placed in a beaker, in which is suspended a cylinder of platinum gauze, which acts as the positive pole, and a platinum cone like that in Riche's apparatus, which acts as a negative pole. Two Bunsen cells or a Clamond thermo-electric pile of 150 elements may be used to effect precipitation, which is complete in about ten hours. The firmly-adhering deposit is washed with water, then with alcohol, and dried. If the mineral contains copper, the latter is deposited with the zinc. The deposit on the cone must in this case be dissolved in nitric acid, and the copper precipitated from the acid solution. If cadmium is present, it must be removed by treatment with hydrogen sulphide. The potassium cyanide should be used in the proportion given above. If more is added, the metal is deposited very slowly, while if less is added, the deposit of zinc is not adherent. Any action on the electrodes may be prevented by mixing the solution with

Digitized by Google

ammonium acetate or nitrate. The latter, however, retards the precipitation of the zinc.

Long-Distance Telephoning.—A notable experiment in long-distance telephoning, says the *Scientific American*, was recently made on the new compound steel-copper wire of the Postal Telegraph Company, lately completed between New York and Cleveland, Ohio, a stretch of 650 miles. The compound wire has a diameter of $\frac{7}{32}$ of an inch, consists of a steel wire core, weighing 200 pounds per mile, that will resist a tensile strain of 1650 pounds, on which copper is deposited to the extent of 500 pounds per mile, with a resistance to the electric current not exceeding $1\frac{7}{10}$ ohms. The wire has seven times greater conductivity than iron wire of equal size, copper being the best conductor known except silver. It has double the tensile strength of iron wire of equal weight when strung on the lines, will last longer, permits the use of low tension currents and small batteries. Ninety per cent of the wires now in use are No. 9 iron, with a resistance of 20 ohms per mile, and the very best are No. 6 iron, with a resistance of 10 ohms, while the compound wire to be used by this company has a resistance of only $1\frac{7}{10}$ ohms. The resistance of No. 9 iron wire on a line from New York to Chicago, 1000 miles, is over 20,000 ohms, and on a No. 6 iron wire over 10,000 ohms, and on the compound wire less than 1700 ohms, thus bringing Chicago telegraphically as near to New York as Philadelphia, and San Francisco as near as Cleveland, compared with the best wires now in use. When the two compound wires are completed between this city and Chicago, their operating capacities will, it is said, be thirty thousand messages per day. The new conductor is certainly a great improvement over any land line of similar length heretofore established, and its successful completion marks the opening of a new era in the progress of electrical communication.

Mr. F. W. Cushing, the manager of the Postal Telegraph Company in this city, states that on the 7th inst. a speaking trial was made over the new line from New York to Cleveland, the transmitting telephone used being that of Mr. George M. Hopkins. The words spoken in this city were, it is said, distinctly heard in Cleveland. The success of the experiment was so conclusive as to satisfy the officers of the company that in the near future the length of the telephonic circuits may be greatly extended; and they believe Chicago will shortly be brought within hearing of New York, a distance of about one thousand miles. The peculiar feature of the Hopkins transmitter is, that one end of the carbon electrode is supported upon or floats on a liquid—mercury—the fluid serving to press the electrode into contact with the carbon button of the telephone diaphragm, without the intervention of a spring or weight. It is, therefore, a self-adjusting instrument, always in readiness for speaking, whether subject to the loudest or the softest tones, upon the longest or the shortest lines.

THE second issue of the *Water-Gas Journal* comes to us bright and attractive in appearance, and well filled with interesting matter concerning the interests with which, as its name implies, it is identified. It is published monthly in Philadelphia by Mr. Leon P. Lowe, Mr. George W. Graeff, Jr., being the managing editor.

A LARGE BLAST IN A SPANISH IRON MINE.—A report of the directors of the Marbella Iron Company, working mines in Spain, says: The attention of your directors having been called to the successful results, both as regards rapid progress and economy of labor, which had been obtained at the Argyllshire granite quarries, the breakwater works at Holyhead, and elsewhere, by the use of "monster blasts," they commissioned an experienced mining engineer, already well acquainted with the circumstances under which our mining operations in Spain are carried on, to examine into the matter, and report as to whether the system referred to might be adopted with advantage at Marbella mines, principally with a view to increasing the output. The engineer's reply was of a sufficiently favorable nature to encourage an experiment. A mine was driven under his directions, and two magazines were prepared, each containing 30 cwt. of gunpowder, which were exploded simultaneously, by means of an electric battery, during the last week of October. The immediate result was all that could have been desired. The portion of the hillside which it was intended to dislodge was heaved quietly over, not a single stone being thrown to any great distance. It was confidently expected that sufficient ore had been obtained to furnish a good output for several months with very little more expense than that of selection and transport; but in a few days, it became evident that the hill had been affected to a much greater extent than was at first apparent. Large masses of earth and limestone, which form the overburden or cap of the lode, began slowly to detach themselves, and to roll down the slope of the hill to the floor of the open cast workings, making the place so dangerous that it was necessary to withdraw all the miners. These falls continued at short intervals until nearly the middle of December, since which time a full force of men has been actively employed in clearing away the rubbish. It will be seen, therefore, from the foregoing, that the output of 18,600 tons was really raised between July and October, and that the operations of November and December, being entirely of an unproductive nature, have reduced, instead of adding to, the profits of the year. It must, however, be clearly understood that this expenditure has been unproductive merely in the sense of immediate profits, because the portion of the overburden which fell on the ore must necessarily have been removed sooner or later, and there can be no doubt that in its present loose state the rubbish is much cheaper to handle than if it had been attacked in the solid at the top of the hill.

FURNACE, MILL, AND FACTORY.

A company has been formed in Newark, N. J., called the American Electric Storage Company, to take over the Keith patent. We are informed that the system is now in working order at the office of the company, No. 792 Broad street, Newark.

At Niles, Ohio, the Arnold furnace, which was recently blown in after undergoing extensive repairs, is working satisfactorily and making a large output.

Ground was broken for a new furnace at Cranberry, North Carolina, on March 3d. Among the gentlemen present were Gen. A. Pardee, Jr., General Hoke, C. H. Nimson, John S. Wise, and George Richards, James H. Simpson, and Augustus C. Canfield, of Dover.

The Iron and Steel-Works at Ironton, Ohio, were offered at public sale recently, but no bids were offered.

The Charlotte furnace, at Scottdale, Pa., has been banked down, on account of the large amount of metal on hand and no orders. The company will not resume for at least one month, and not then if business does not brighten up. This company's ore mines at Mount Vernon, on Chestnut Ridge, five miles from the furnace, will continue work until April 1st, and, if the furnace is not put in blast at that time, will likely shut down also, which will throw about seventy-five more men out of employment.

The Allentown Rolling-Mill Company resumed work in its Lehigh mill on the 12th, giving employment to 400 men.

The new furnace of the Cherry Valley Iron Company, at Leetonia, Ohio, is completed, and will blow in soon. The new stack is seventy-five feet high, and it is expected the furnace will turn out at least 100 tons per day.

With the exception of the bar mill, all portions of the rolling-mill of Andrews Brothers & Co., at Haselton, Ohio, are running full time. No. 2 of their blast-furnaces is in, No. 1 having been blown out some time ago.

At a meeting of the Western Nail Association, on the 11th inst., it was decided to make no change in the selling price of nails—$3.40 per keg; to resume operations on the 19th, work for three weeks, and then shut down for two weeks more. The action is rather surprising to a majority of persons who think they know considerable about the trade, and is a disappointment to the 8000 workmen, who regard this as the best season of the year, and who hoped that no more suspensions would be ordered. The manufacturers justify their course on the ground that jobbers seem unable to rid themselves of the impression that they should regulate the price of nails, and that those who manufacture should have nothing to say concerning the price.

At the works of Kern & Co., in Silesia, Germany, a gas-heated furnace is used for heating iron wire. The apparatus comprises ten ovens, arranged in a circle, with a central crane for moving the pots and weights. These ovens are cylindrical in shape, and the gas is introduced underneath, having been mixed with atmospheric air while yet in the burners. The flames surround the wire pot and pass combustion products off through an opening directly in the top of the oven. The apparatus in question has been in use for about eighteen months, and has been giving general satisfaction. The pots are more thoroughly heated and last much longer than by the old system.

No. 3 stack of the North Lebanon furnaces, at Lebanon, will blow out shortly for repairs.

Oliphant furnace, owned by the Fayette Coke and Furnace Company, will soon be ready for work. Extensive repairs have been made during the stop, and several needed improvements added.

The Youngstown (Ohio) Steel Company made a test of its new plant last week, which was eminently satisfactory in every respect, a fine quality of steel being produced. At present, the company employs but 30 men, but the force will soon be increased.

A contract has been made between the Harrison Wire Company and the Marsh & Harwood Company, of St. Louis, whereby the waste acid product from the wire-works is to be utilized in the manufacture of copperas. A works for the purpose is building near the wire plant. It is estimated that the product saved hereafter will be worth several thousand dollars every year.

Stack No. 2 of the Pioneer furnaces, Missouri, has been blown out on account of low prices for pig-iron, and will be overhauled and repaired during the idleness. The force of wood-choppers has been reduced considerably.

GENERAL MINING NEWS.

ARIZONA.

PEABODY.—A copper-smelting plant, from Messrs. Fraser & Chalmers, has been contracted for by this company, located in the Dragoon Mountains.

UNITED VERDE COPPER COMPANY.—Mr. F. F. Thomas, manager of this company, has ordered a copper-smelting plant from Messrs. Fraser & Chalmers, Chicago.

EMPIRE DISTRICT.

TOTAL WRECK.—Our correspondent "Bendigo" sends us the following under date of March 10th: The Total Wreck mill has been at work since February 13th. The beginning was of necessity slow. It had to be tested, machinery adjusted, batteries and pans regulated, and interstices filled. Therefore, taking into consideration the usual delay in starting a new mill, the results, so far, have been very satisfactory. The clean-up for the first eleven days is $50,000 in round numbers, or about $5000 a day, which ought to be satisfactory to the stockholders. It certainly confirms the judgment of its friends, as heretofore expressed. This property has, since its discovery, been managed on business principles. The management, while encountering many difficulties, has pursued a steady, straightforward course, never doubting, never flagging in the prosecution of the work of opening a body of ore sufficient to justify the erection of a twenty-stamp mill, and to keep it at work constantly for at least two years, the wisdom of which is now manifest. The Total Wreck Company has now 40,000 tons of ore in sight in its mine. The battery assays give from $81 to $90.06 per ton. The capacity of the mill is sixty tons per day. The bullion is 935 fine. Developing the mine was renewed with the commencement of the reduction of the ores, and is showing larger and richer bodies of ore than those now worked. For once, enterprising New York gentlemen are to be congratulated in having one of the best paying mines in Arizona.

GRAHAM COUNTY.

From the Clifton *Clarion* we have the following:

ARIZONA COPPER COMPANY.—The Coronado group, the property of this company, consists of the Matilda, Copper Crown, Crown Reef, Coronado, Horseshoe, and Boulder, 9000 feet in length of surface ground, besides other properties. From the Matilda down to the Boulder, a distance of one and a half miles, there is a vertical difference in depth of 1000 feet, and over this entire distance the croppings are very plain. The principal work has been done on the Matilda and the Copper Crown on the eastern slope, and on the Horseshoe on the western slope running down toward Eagle River. The upper incline railroad passes through the hill by a tunnel cut on the ore-vein. This tunnel, when completed, will be 1200 feet in length. It is now in about one half of the distance. This tunnel will afford facilities for getting out the ore from the Horseshoe and other claims on the extreme west, which will be connected with the main track by means of inclined railroads, and at the same time stoping can be done at any point along its entire length with but slight interruption to the transfer of cars. The average width of the vein in these mines is four feet, and the assay averages 14 per cent copper.

CHASE CREEK.—This group consists of nine locations, six of which show good copper ore in the croppings. On three of these claims—the Lulu, Maud S., and Bon Ton—considerable development-work has been done. A tunnel has been run on the Lulu to tap the vein, which is now in 240 feet. The head of the tunnel is in iron and spar. The ore is carbonate, and assays show 20 per cent copper. The Maud S., adjoining the Lulu on the north, shows the same kind of ore. About 60 tons from this claim have been worked in the Clifton smelter, and have yielded a satisfactory percentage of copper. An incline has been run down on the vein a distance of 80 feet, and there is still an abundance of good ore in the face. It is from this tunnel that the ore which has been worked in the smelter has been extracted. The Bon Ton, the third claim which has been worked to any extent, has an incline tunnel 220 feet, which taps the vein at a distance of 100 feet. The ore in this claim, while of the same character as that in the Lulu and Maud S., is not of as good quality.

DETROIT COPPER COMPANY.—This company, which adjoins the Longfellow property on the west, and is connected with that property by a tunnel through the Yankie, owns the Copper Mountain, Yankie, Arizona Centra

Digitized by Google

and Montezuma mines. At a distance of 200 feet from the entrance of the tunnel, the first large ore-body in the Copper Mountain was cut. Stoping is carried on from this point westward and south, on what is evidently a cross-vein or feeder of the main lode. Two winzes have been sunk to a depth of fifty feet each, both of which went down in rich ore, and large stopes are worked at present on the second level, which is 500 feet in length. In addition to the ore-bodies in the mine, there are large surface deposits of rich copper ore, and iron carrying a large percentage of copper, which makes it very valuable for fluxing purposes. The Yankie mine adjoins the Longfellow. The shaft is 150 feet deep. The first level is at a depth of 95 feet. Here large quantities of red oxide ore are stoped out. A winze to connect with the level below is sinking, which is now down 30 feet, and was sunk in solid ore from the top. Large stopes of ore are worked on the second level at a depth of 150 feet. Probably the largest body of glance ore anywhere in this section belongs to this mine, and is on what is known as the Lower Yankie. One of the shafts on the Arizona Central has been sunk 75 feet in rich carbonates and copper glance. A whim has lately been placed on No. 1 shaft, and a drift is running to connect Nos. 1 and 2 shafts. When this is through, an unlimited amount of ore can be stoped. Part of this property, called the Upper Arizona Central, has a large body of carbonate ore. It is the intention to put in a tramway to connect this part of the Arizona Central with the Copper Mountain mine. Not much is doing at present at the Montezuma mine.

CALIFORNIA.

MONO COUNTY—BODIE DISTRICT.

BODIE CONSOLIDATED.—There were crushed during the past week 137 tons of ore; average assay value, $29 per ton. The east cross-cut, 1000 level, was advanced 11 feet. The north drift, 800 level, is 269 feet long. The flow of water is decreasing somewhat.

STANDARD CONSOLIDATED.—During the past week, 1266 tons of ore were milled. The south drift on the 1000 level has been connected with a winze in Bodie Consolidated. There is no special change in this or the upper levels.

SYNDICATE.—The mill will start up on March 20th.

PLUMAS COUNTY—GREENVILLE DISTRICT.

The Greenville *Bulletin* says:

GREEN MOUNTAIN.—The water supply being exhausted, the mills were forced to stop, though water has been supplied to furnish power for running the air-compressor, so that work in the tunnel has not been interrupted; the ventilating fan is in operation and the work is going on more rapidly than before.

TAYLOR-PLUMAS.—This mill is also idle for want of water in the mine. Most of the work lately done has been confined to the winze; the drift here has been steadily pushed eastward, with good prospects as the work advances. A few hands were put to work last week in the face of the main tunnel; the ground here gives indications of becoming softer, and, according to the usual experience, the ledge may be expected to widen out.

SAN BERNARDINO COUNTY—PROVIDENCE MINING DISTRICT.

The Providence *Times* reports as follows:

A new strike was recently made between the Bonanza King and Rattler. The shaft is now down some 12 feet, with every prospect of a fine body of ore. The company also, in sinking a winze in the south end of the mine, struck another body of fine mineral.

A mine has been opened north of the Bonanza King, which is showing up a considerable quantity of high-grade ore. There are now sunk two shafts, one some 50 feet and the other about 25, with several openings along the ledge. In drifting from the bottom of one of the shafts, some high-grade ore has been taken out.

BONANZA KING.—The mill is still running on second-class ore and turning out two thousand ounces of silver daily, 930 fine. The mine is looking better than at any other time during its history. The rich strike in the extreme south end of the first level continues.

LUCKNOW.—The owners have run across a ledge of about ten feet carrying mineral the full width. There are several other small openings on this claim, making a good showing of mineral.

CANADA.

It is stated that the Preston phosphate mine at St. Helen's Lake, Portland West, near the celebrated Light Rock mine, has recently been sold to a New York company for $100,000. Preparations are making to carry on operations extensively as soon as the spring opens.

NEW BRUNSWICK.

ELM TREE.—The ore has been concentrated with satisfactory results.

NOVA SCOTIA.

OXFORD.—A new vein of gold quartz, some sixty feet south of this mine, is now opening by the owners of that property. It gives prospects of turning out equally valuable with the other lead, now yielding so richly, the quartz already obtained looking very promising.

COLORADO.

We are informed by Mr. W. E. Wright, of Rome, N. Y., that a manganiferous iron ore mine has been opened in the foot-hills of the Cheyenne Range, southeast from Pike's Peak, about twelve miles west of the Denver & Rio Grande Railroad, and about fourteen miles north of the line from Pueblo to Leadville. There are three claims from which ore has been taken, containing, by analysis, 13·54 per cent of metallic iron, 35·44 per cent of manganese, 0·07 per cent of sulphur, a trace of phosphorus, 6·58 per cent of silica, 4·40 per cent of magnesia, 1·20 per cent of carbonic acid, a trace of lime, 8·70 per cent of alumina, and 2·94 per cent of moisture and organic matter. Two other analyses showed 18·59 and 28·02 metallic iron, 21·04 and 12·95 per cent of manganese. 10·59 and 14·89 per cent of silica, 0·15 and 0·11 per cent of phosphorus, and 0·10 and 0·08 per cent of sulphur. Other assays show a range of 3·99, 5·38, 7·12, and 28·2 per cent of manganese and 22·61, 30·35, 47·12, and 35·7 per cent of iron, the ore, therefore, being suitable for spiegeleisen manufacture.

SUMMIT SILVER.—This is a reorganization of the old Akron Mining Company. Its purpose is to at once sink a shaft on the territory of the company, to strike a lode that is now successfully worked in what is known as the Murray mine, near Lawson, Columbia Mountain. The Summit Mining Company was organized March 2d, by the election of five directors, namely, O. C. Barber, Frank Adams, George T. Perkins, H. E. Merrill, and N. B. Stone. The stock, $50,000, has all been taken, and as soon as snow is off, the company will begin work. On the 6th, the directors met and organized by electing George T. Perkins President, and N. B. Stone Secretary and Treasurer.

CLEAR CREEK COUNTY.

EMPIRE CITY.—This lode is worked with an adit run in on the vein from the base of the mountain, which has now reached a distance of 280 feet. Arrangements have been made to erect a stamp-mill.

MOLINE TUNNEL.—This company has lately purchased the New Boston lode and the mill belonging to it, since which time it has suspended work in the breast of the tunnel and is now drifting east on the vein. Arrangements are making for a plant of machinery to be put up in the mill, for concentrating the ore, which will be ready for operation in a very short time. The construction of a wire tram is also contemplated.

DOLORES COUNTY.

RICO PASADENA.—This company has purchased the interests of E. L. Davis and T. B. Townsend in the Leila Davis mine, and increased its capital stock to $2,000,000.

FREMONT COUNTY.

The Royal George smelter, at Cañon City, will blow in shortly. It will be of the water-jacket pattern, with two stacks, and, for its size, will be very complete.

GILPIN COUNTY.

The Central City *Register-Call* says that negotiations are pending for the sale of several mines in Independent and Central mining districts. The mines of these districts are receiving more than ordinary attention from capitalists.

CARROLL.—This mine is worked under tribute to a party of miners. In sinking the working-shaft, quite a body of pay material was left on the hanging-wall, which the miners are taking down and sending to the stamp-mill and sampling-works. A portion of the dump-pile, thrown away as worthless, was sent to the stamp-mill and yielded 3¼ ounces gold per cord. The shaft is 85 feet deep, and has good walls, the vein being a well-defined true fissure. Since the recent parties took hold of the property, they have raised mill-dirt that yielded from 4 to 6 ounces per cord. The smelting ore nets from $40 to $50 per ton.

HARD MONEY.—The lessees of a part of this mine west of the main shaft, in sinking, broke into a vein of mineral precisely of the same quality and appearance as that found in the main shaft at the depth of 130 feet. When the mineral was first struck, it had some lead; but in sinking the last few feet, it has changed materially for the better in quality and quantity.

HIDDEN TREASURE.—Arrangements have been made for running a tunnel in on the vein and under Perigo Mountain. The tunnel will be the means not only of opening up undeveloped portions of the vein, but will drain the mine to a depth of over 500 feet.

ROLLINS.—The company has its air-compressors in readiness to start up at any time, and will use power drills in driving the lower cross-cut tunnel, which will intersect the Perigo vein at a depth of 600 feet. The company will undoubtedly increase its stamping capacity by the erection of a 50-stamp mill this season.

WHITING.—Work has been begun in this mine, which has been idle for a year.

GUNNISON COUNTY.

GOLD CUP.—The Tin Cup *Banner* states that regular shipments are made. The ore shipped to Denver averages from 107 to 208 ounces. Besides the large quantity of first-class ore stored away at the mine, there is a large dump of lower grade, assays of which give not less than thirty ounces in silver per ton. The mineral body varies from three to seven feet. The new engine will soon be in working order, when more men will be employed.

LAKE COUNTY.

Late Leadville advices contain the following:

BIG CHIEF.—The pumps have been started up, and the mine will soon be free from water and ready for working. It is believed that in some portion of the mine the ore-body lies above the present workings.

DUNKIN.—The mine is now worked, and sufficient ore is shipped to yield a profit above expenses. The work is confined to the north workings, where some good ore has been found in the second level. A drift is running on the third level, to get under the ore-body, when shipments will be increased.

LITTLE PITTSBURG.—The manager expects to resume work on the north end of the property. The No. 10 shaft will be put down, and drifts run to catch the ore-bodies developed by the recent strikes in that neighborhood.

MORNING STAR AND EVENING STAR.—The Morning Star is maintaining its shipments at about seventy-five tons of ore a day. The Waterloo incline is advancing, and still carries the ore-body with it. The sinking of the McHarg shaft is progressing. The shaft has now reached and penetrated what may be called the first contact, and it will be rapidly pushed to the lower or Waterloo contact, where, from present indications, there is every prospect that the ore-body developed in the incline with which the shaft will connect will be cut.

Shipments from the Evening Star continue at about seventy tons daily. The sinking of the upper shaft to tap the lower contact will not be resumed until heavier pumping machinery is put in. The mine is looking well.

PITKIN COUNTY.

The Leadville *Herald* states that reports from Aspen show that mining operations are nearly at a stand-still in that camp, owing to the lack of a market for the ore, and the fact that the prospecting season has not yet opened. The North Texas Smelting Company, which was expected to afford an ore-market, has its smelter completed, but does not possess the necessary funds to operate it on a profitable basis. Its investigations have shown that the camp is capable of maintaining a sufficient supply of ore; but owing to its character, it will be necessary to add roasters to the present plant, in order to treat it successfully. Until this company succeeds in raising the funds requisite to enable it to go on, or the smelter passes into the hands of men with greater capital, it is probable that things will be a little dull at Aspen, as most of the larger mines are shut down or doing but little work, preferring to wait for a home market rather than ship at the present heavy expense of transportation.

In the Stevens and Leiter property, near Highland, a body of very fair-grade ore has been opened up, that runs from forty to fifty ounces in silver, and well in lead.

The Camp Bird has developed a good body of high-grade ore, running several hundred ounces in silver.

The Buckhorn has recently caught the edge of a good ore-body.

The Oakland No. 2, at the head of Queen's Gulch, is working, and has exposed some very fair ore.

The Pioneer is working, but the Spar and the Smuggler are practically shut down.

At Ashcroft, work is confined mainly to the Tam O'Shanter group, where a shaft is sinking on the Montezuma vein. The mine shows a great deal of ore.

SUMMIT COUNTY.

ROBINSON.—No shipments have yet been made from this mine, although there is ore on hand. A good body of ore has been opened up in the winze from the twelfth level, and it is proposed to sink an incline from the bottom of the winze down the ore-body. The machine drills have been taken out, and a contract let to sink the new incline fifty feet. It is expected that this work will take about a month, when more will be known in regard to the future of the mine.

DAKOTA.

Dispatches to the New York *Tribune* state that the principal mining operations in the Black Hills are confined to "the belt," a strip of land about four miles long and two miles wide, in the immediate vicinity of the Homestake, Deadwood-Terra, and other noted mines.

In the central and southern hills, the following mills are idle: Pennington, Scandinavian, Minnesota, Charter Oak, Standby, Alta, Lodi, Grand Junction, Penobscot, Hartford, Dickover, Golden Star, Cross, Queen Bell, Uncle Sam, Florence, Sitting Bull (smelter), Oro Fino, Noble Grand, and Clermont; ranging in capacity from the one-stamp Uncle Sam to the sixty-stamp Standby. A number of these mills were closed by the freezing of water-ditches, and will start up in the spring; but most of them were erected for the purpose of gulling the public, and will remain inactive unless removed to better locations.

Placer mining has seen its best days in the neighborhood of Galena; still, much gold will be taken from gravel for years to come. The principal companies interested in this branch are the Deadwood Hydraulic, Nigger Hill, Sand Creek, Estrella del Norte, Rockerville Hydraulic, Harney, Battle Creek, Castle Creek, and Fort Meade. All of these companies have spent much money preparing for thorough work, and all will resort to the bed-rock flume and ground-sluicing process almost exclusively.

Custer County mica interests have proved of great value, and will attract

Digitized by Google

much attention to the Black Hills hereafter. The mica, of great purity, abounds in ledges of large proportions. Shipments last year were large and frequent.

CALEDONIA.—The superintendent reports for the week ended March 4th: Ore produced, 1025 tons; shipped, 600 ounces gold; value, $10,000. The lower winze has advanced 6 feet; total, 35 feet; all in very good ore. The upper winze has advanced 15 feet; total, 56 feet. Connection will be made with the chamber to-morrow.

FATHER DE SMET.—The superintendent reports as follows: Herewith express company's receipt for bar No. 153, 601·78 ounces gold bullion, the result of run of mill for the first half of February. Scarcity of water, caused by the severe cold weather, with poor ore, is the cause of this small bar. Water is now abundant, and the ore is of better quality, although the general outlook is not as promising as I wish it was. We are running the north end tunnel; also the third level header, which is in milling ore; also a cross-cut to the east from chamber on third level. I shall soon start two drifts on second level, in both of which I hope to strike good bodies of ore. Report of mine from February 22d to March 1st shows ore extracted from first, second, and third levels, 2100 tons. Ore milled, 2100 tons. Third level header advanced 3½ feet. Header in 145½ feet. North end tunnel advanced 11 feet. Tunnel in 831 feet. I have started a rise to the surface at the end of the west cross-cut tramway level. It will be known as tramway level rise, and has advanced 18 feet.

FLORENCE.—This mill, at Galena, has resumed work upon a sufficient quantity of milling ore to insure at least a thirty days' run.

GOLDEN SUMMIT.—The mill, situated in Pennington County, is working smoothly on ore averaging $25 per ton, the total expense of mining and milling being less than $2.50 per ton. Great interest centers in the Golden Summit mine, as much has been said of it within the last six months. An open cut about 50 feet long exposes a 4-foot ore-body to a depth of about 25 feet; but whether it is a true fissure-vein or simply a deposit of no great extent, remains to be determined. It is believed, however, that the mistake of the Standby Company, which erected $150,000 works on a worthless location, has not been repeated.

GREAT EASTERN.—The mill has been silent for a long time through the apathy of the directors, and prospects are unfavorable for a change.

HIGHLAND.—A dispatch from Deadwood states that a portion of the mine caved in March 12th. The miners all managed to escape uninjured, excepting one who was fatally hurt.

PORTLAND-SNOWSTORM.—The mills situated at Bald Mountain stand upon good property, but dissensions in the companies made necessary a stoppage of work. It is reported that all the differences regarding the Portland have been adjusted; that the present mill will shortly resume work; and that a 100-stamp mill will be erected the coming season.

GEORGIA.

The Dahlonega *Signal* says:

COLUMBIA.—Work has been resumed, and the 4000-foot flume will be finished shortly. This line is to extend to property recently purchased by the company on Findley Ridge, half a mile southwest of the Bast of the Consolidated. The ore is in great abundance, and of a uniform grade, the lead being from 300 to 400 feet wide. The mine can be worked to a great advantage, as the proposed flume-line, when completed, will be 5000 feet long, which will entirely wear out the slate and clay, and greatly reduce the ore.

LOUD.—Some of the ore taken out is very rough, and has the appearance of gold taken directly from a quartz vein; other ores are imbedded in iron that seems to be of an aqueous formation; and other ores carry quartz. The gold taken from this mine is different in appearance from any other found on this belt.

IDAHO.

A correspondent of the Salt Lake *Tribune*, in speaking of the Lava Creek Mining District, says: The character of the ore is free milling. First in point of development is the Park mine. A shaft of 50 feet has been sunk on the ledge, about the center of the claim, with good pay-ore from the surface to the bottom. On the southeast of the claim, a tunnel has been run, which has tapped the vein at a depth of 100 feet. The ore-body is from eighteen inches to two and a half feet, rich in horn-silver, black sulphurets, and chloride. Northwest and joining the Park, is the Elk Horn, with a shaft 30 feet; the ore the same as the Park.

Next on the northwest is the Palace, with a shaft fifty feet. A few tons of ore from this mine sampled 296 ounces in silver and a percentage of gold.

To the southwest is the Noyes mine, with a shaft seventy-five feet, and the Emily Melville, running fifty feet, each showing good ore-bodies, assaying from $200 to $300 in silver. A tunnel is to tap the vein at a depth of 300 feet.

South and east, joining the Park, is the Valley mine, with a shaft twenty feet. The ledge is four feet wide, with ore assaying $50 to $100 in silver and a percentage of gold.

Joining on the south is the Joe Wilson tunnel, in twenty feet, showing a ledge four feet in width, assaying $100 to $500 in gold and silver, the larger percentage gold.

A quarter of a mile east from the Joe Wilson are the Picayune and Golden Chariot. The Golden Chariot has shafts from 15 to 20 feet deep at intervals the whole 1500 feet. The ledge is from two to three feet wide.

The mines are easy of access from Blackfoot. The distance is 75 miles, and from the Wood River Branch Railroad 50 miles. Wood and water for all purposes are near by. What the camp needs is a good mill.

MAINE.

WINSLOW TIN MINE.—Work has been resumed; men are at work pumping out the water.

ROSIER MINE.—A correspondent of the Bangor *Journal* says that there has been but a small force employed in the mine this winter, and consequently No. 2 and No. 3 shafts, from which large quantities of ore have been taken, have remained idle. The work of development has, however, been steadily going on in No. 1 shaft, with varied success. At the depth of 200 feet, ore of a good quality was found for some days; but the vein soon seemed to undergo a change, striking off at an angle which it was impossible to follow with the shaft, and only a portion of the foot-wall remained visible and very little ore was found for several weeks. But in the last few days, the vein has become more settled and regular, and ore of a very fine grade has been taken out. The vein is fast widening and the ore-body increasing in proportions.

MEXICO.

RONCESVALLES.—It is reported that this mine, in Batopilas District, Chihuahua, is again in bonanza.

MONTANA.

COLLAR.—This mine is building a twenty-stamp mill and sampling-works, two and a half miles from Fort Maginnis, under the direction of William M. Courtis, M.E.

LEXINGTON.—In our issue of February 24th, 1883, in quoting a communication to the Salt Lake *Tribune*, we gave the average amalgamation of the new mill for the month of January at 97·7 per cent. It should have been 89·7 per cent. The month of February, as Mr. F. Medhurst, general manager of the company informs us, was the most satisfactory in the history of the new mill, the average chlorination being 86·4 per cent, and the average amalgamation 91·4 per cent. On the 400-foot level, an ore-chute has been explored for a length of 120 feet, showing a body of ore of a uniform width of three feet, which samples 100 ounces in silver from one end to the other. The average ore-production of the Lexington during February was 55 tons.

MONTANA COPPER COMPANY.—The Butte *Miner* says that this company confines its work in the Colusa strictly to that point where the copper ore contains an average of about forty ounces of silver per ton. Sufficient ore is taken out to supply the blast-furnace, and five matting furnaces. It requires the steady run of eight calcining furnaces to calcine the ores; two more calcining furnaces are in process of construction, and will be started up shortly.

NEVADA.

ALBION.—The San Francisco *Stock Report* says that the mine has been placed under the direction of Mr. Reed, for many years superintendent of the Eureka Consolidated.

EUREKA TUNNEL.—The report of the superintendent and secretary shows that work was commenced in January, 1878, and has been continuously prosecuted to this date. The tunnel is now in length 2007 feet, the face in favorable looking mineralized lime, work on which has been discontinued for the present on account of bad air. The ore-bodies now extracted are about 1100 feet from the mouth or opening of the tunnel and below its level. In addition to the work on the tunnel, about 2500 feet of shafts, winzes, drifts, and stopes have been excavated in prospecting for and the extraction of ore. Net proceeds from ore reduced at furnaces from May 10th, 1882, to March 1st, 1883, $66,258.61. The present indebtedness of the company is reported to be $47,451.60.

SUTRO TUNNEL.—At the annual meeting, the following trustees were elected: C. W. Brush, W. Johns, F. F. Low, David Cahn, Thomas P. Storey, Hugh Marshall, and P. W. Ames. The company is doing no aggressive work at present. The tunnels are kept clear and in good repair, and the flow of water is uninterrupted.

NEW MEXICO.

Mr. Magruder, of Silver City, has ordered a copper-smelting plant from Messrs. Fraser & Chalmers, of Chicago.

Considerable excitement has been caused by the discovery of gold in Hell's Cañon. Several new strikes are reported in the Floridas. Extravagant reports are circulated about heavy strikes in the Organ and San Andres ranges. There has never yet been found in either of these ranges a property that has warranted the erection of a five-ton smelter, and there is not a smelter or mill in either.

MASSACHUSETTS & NEW MEXICO.—A dispatch to the New York *Tribune* says that the 'company's mines, situated in the Hachita Range, on the line of Chihuahua and New Mexico, have closed down, and the miners have seized the property for wages.

NEW MEXICO & ILLINOIS MINING AND MANUFACTURING COMPANY.—At the annual meeting at Albuquerque, recently, the following directors were elected for the ensuing year: Benjamin L. Cook, George D. Cook, B. L. Jones, William Vannatta, and Thomas Penrose, of Chicago; William Borchert, W. E. Talbott, and A. M. Codington, of Albuquerque; and Frederick Haberland, of Rio Puerco. A smelter of thirty tons' capacity has been ordered, and will be at Chama by March 15th, and will be taken to Copper City immediately thereafter and set up. The company proposes to push its interests forward as rapidly as possible this year.

ST. LOUIS.—Another rich strike was recently made on the St. Louis mine. As the third level was driving south on a rich mineral vein, a large body of red oxide and copper glance was encountered at a distance of 70 feet. An average fire-assay across the vein runs 35 per cent copper. Within the last week, several bodies of rich mineral have been encountered in the lower workings, where none was supposed to exist.

VALVERDE MINING COMPANY.—Work has been commenced within the last week on the Centralia mine, owned by this company, of Paschal. This is one of the most promising prospects in the Burros. The work done has exposed a fine vein of black oxides, carbonate of copper and azurite, between gneiss and porphyry. Work on it will be watched with great interest, as it is supposed to be a parallel ledge of the St. Louis and Pittsburg mines. The water-jacket furnace has been in operation for several weeks.

NORTH CAROLINA.

The great mine at Cranberry is doing well, and has about 5000 tons of ore on hand. It recently shipped 1500 tons of the ore to Allentown, to be used in the manufacture of Bessemer pig.

TENNESSEE.

Zinc mining in East Tennessee is fast assuming important proportions. The old Mossy Creek mines, in Knox County, have been reopened, and are now worked successfully.

UTAH.

SAMPSON.—The Salt Lake *Tribune* speaks of this mine as follows: The mine is located in the basin just east of Piñon Hill, and the Crescent Company. The works are near the upper end of the gulch, and the lower workings are in solid ground. The original workings were located several hundred feet down the gulch, where a shaft was sunk and much work done prior to last year. When the present manager took hold of the management last season, he at once began a new shaft farther up. This shaft had a horse-power hoisting-works placed over it, and the shaft went down in a short time to the depth of 235 feet. The air becoming bad, work was suspended. In the mean time, an incline, known as the Van Praag, was run in from a much lower point, the mouth being 600 feet east of the shaft. The two have since been connected by a drift. At the mouth of the incline, a steam-engine and boiler have been put in operation, with suitable hoisting apparatus. At a point 170 feet from the mouth of the incline, a cross-cut was run to the ledge, 25 feet, and on this ledge drifting has been done each way for a distance of 25 feet, making 50 feet drift on the vein. This is 110 feet below the surface, and in ore from one to three feet wide. A winze is sinking, starting on ore eight inches wide, and in going down thirteen feet the ledge widened to eighteen inches, while the quality of ore is good and improving. This ore has been prospected for eighty feet in length on the vein, being first-class all that distance. It is the intention of the company to sink a two-compartment shaft at the mouth of the tunnel, 400 feet deep, where it will, it is thought, tap the vein. At the 200-foot level, a cross-cut will be run to tap the ledge. In the mean time, the work of mining will go on in the incline, the ore in sight being able to pay the expenses of these developments. At present, the miners are taking out from three-quarters to one and a quarter tons of ore per day, and sixteen men are employed in mining and doing dead-work. The ledge is a true fissure-vein, inclosed in walls of quartzite and porphyry. An assay of some ore shipped showed 48 per cent lead and 107·9 ounces silver, with a trace of gold. The ore from the bottom of the drift goes 42 per cent lead and 164·9 ounces silver. In sinking the shaft, at the upper end, the workmen struck ore in pockets at various points, before getting down to solid ground. As it is, they know that there is a well-defined ledge for 600 feet in the ground thus far explored.

VIRGINIA.

A corporation to be known as the Rorer Iron Company has been organized at Roanoke, with Ferdinand Rorer, of Roanoke, President; Samuel Coit, of Hartford, Conn., Vice-President; J. H. Sykes, of New York, Treasurer; Lucian H. Coke, of Roanoke, Secretary. Directors: G. M. Bartholomew, Samuel Coit, of Hartford, Conn.; George N. Gray, of Ironton, Ohio; E. G. McClannahan, G. Rorer, Roanoke. The Rorer Iron Company owns 3000 acres of land, most of which is rich in magnetic iron ore, situated in Cave Spring District, the western portion of Roanoke County, including the Joseph A. Gale property, on which a mining town known as Gale is founded. Gale is about four miles from Roanoke. The company will build a narrow-gauge railroad at once from its mines at Gale, by way of Mr. G. W. Hawbert's farm, to intersect with the Shenandoah Valley Railroad in the west end of Roanoke. On the Roanoke River, the company will erect, as early as practicable, a large furnace, which will be on the line of its narrow-gauge railroad.

WISCONSIN.

The discovery of some fine beds of iron ore on the Wisconsin Central Railroad lands, on the Penokee range, has aroused a great deal of interest in that section. It is stated that the surface ore found on the Penokee range indicates a much heavier deposit than that of the Menominee.
